Executive Summary

The United States Army Corps of Engineers Baltimore District on behalf of the Army National Guard (ARNG)-Installations & Environment Division, Cleanup Branch contracted AECOM Technical Services, Inc. (AECOM) to perform *Preliminary Assessments (PAs) and Site Inspections (SIs) for Perfluorooctanesulfonic acid (PFOS) and Perfluorooctanoic acid (PFOA) Impacted Sites at ARNG Facilities Nationwide*. The ARNG is assessing potential effects on human health related to processes at facilities that used per- and poly-fluoroalkyl substances (PFAS), primarily in the form of aqueous film forming foam released as part of firefighting activities, although other PFAS sources are possible.

AECOM completed a PA for PFAS at the Army Aviation Support Facility (AASF) in St. Paul, Minnesota, Holman Field to assess potential PFAS release areas and exposure pathways to receptors. The AASF is constructed on a 4.25 acre parcel of land owned by the Metropolitan Airports Commission and leased to the Minnesota Army National Guard (MNARNG). The current lease agreement expires on 30 September 2028. The performance of this PA included the following tasks:

- Reviewed data resources to obtain information relevant to suspected PFAS releases
- Conducted a site visit 24 September 2018
- Interviewed current and retired MNARNG personnel, MNARNG environmental managers and operations staff, and the St. Paul Fire Department
- Completed visual site inspections at known or suspected potential PFAS release locations and documented with photographs
- Developed a conceptual site model (CSM) to outline the potential release and pathway of PFAS for the Area of Interest (AOI) and the facility (**Figure ES-1**)

One AOI related to potential PFAS releases was identified at the St. Paul AASF Holman Field during the PA. The AOI is shown on **Figure ES-1** and described below:

Area of Interest	Name	Used by	Potential Release Date
AOI 1	South Hangar Ramp	MNARNG	October 2013

Based on potential aqueous film forming foam releases at this AOI, there is potential for exposure to PFAS contamination in surface soil and intermittent surface water and sediments to site workers, construction workers, and trespassers via ingestion and inhalation of dust. Site workers and construction workers may also be exposed to potential PFAS contamination in subsurface soil via ingestion and inhalation of dust. Potential off-facility PFAS release areas exist adjacent to the AASF. These areas include property downgradient of the facility and are, therefore, unlikely to impact the AASF. The CSM for the St. Paul AASF Holman Field is shown on **Figure ES-2**.

1. Introduction

1.1 Authority and Purpose

The United States (US) Army Corps of Engineers (USACE) Baltimore District on behalf of the Army National Guard (ARNG)-Installations & Environment Division, Cleanup Branch contracted AECOM Technical Services, Inc. (AECOM) to perform *Preliminary Assessments (PAs) and Site Inspections (SIs) for Perfluorooctanesulfonic acid (PFOS) and Perfluorooctanoic acid (PFOA) Impacted Sites at ARNG Facilities Nationwide* under Contract Number W912DR-12-D-0014, Task Order W912DR17F0192, issued 11 August 2017. The ARNG is assessing potential effects on human health related to processes at facilities that used per- and poly-fluoroalkyl substances (PFAS), primarily in the form of aqueous film forming foam (AFFF) released as part of firefighting activities, although other PFAS sources are possible. In addition, the ARNG is assessing businesses or operations adjacent to the ARNG facility (not under the control of ARNG) that could potentially be responsible for a PFAS release.

PFAS are classified as emerging environmental contaminants that are garnering increasing regulatory interest due to their potential risks to human health and the environment. PFAS formulations contain highly diverse mixtures of compounds. Thus, the fate of PFAS compounds in the environment varies. The regulatory framework at both federal and state levels continues to evolve. The US Environmental Protection Agency (USEPA) issued Drinking Water Health Advisories for PFOA and PFOS in May 2016, but there are currently no promulgated national standards regulating PFAS in drinking water. In the absence of federal maximum contaminant levels, some states have adopted their own drinking water standards for PFAS. The State of Minnesota has adopted screening values of 35 parts per trillion (ppt) for PFOA and 27 ppt for PFOS (Minnesota Department of Health, 2018). These values are more protective than the USEPA value of 70 ppt, individually or combined.

This report presents the findings of a PA for PFAS at the Army Aviation Support Facility (AASF) in St. Paul, Minnesota, Holman Field in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations Part 300), and USACE requirements and guidance.

This PA documents the known fire training areas (FTAs) as well as other locations where PFAS may have been released into the environment at the AASF. The term PFAS will be used throughout this report to encompass all PFAS chemicals being evaluated, including PFOS and PFOA, which are key components of AFFF.

1.2 Preliminary Assessment Methods

The performance of this PA included the following tasks:

- Reviewed data resources to obtain information relevant to suspected PFAS releases
- Conducted a site visit on 24 September 2018
- Interviewed current and retired Minnesota Army National Guard (MNARNG) personnel, MNARNG environmental managers and operations staff, and the St. Paul Fire Department
- Completed visual site inspections (VSIs) at known or suspected potential PFAS release locations and documented with photographs
- Developed a conceptual site model (CSM) to outline the potential release and pathway of PFAS for the Area of Interest (AOI) and the facility

1.3 Report Organization

This report has been prepared in accordance with the USEPA *Guidance for Performing Preliminary Assessments under CERCLA* (USEPA, 1991). The report sections and descriptions of each are:

- **Section 1** – **Introduction:** identifies the project purpose and authority and describes the facility location, environmental setting, and methods used to complete the PA
- **Section 2** – **Fire Training Areas:** describes the FTAs at the facility identified during the site visit
- **Section 3** – **Non-Fire Training Areas:** describes other locations of potential PFAS releases at the facility identified during the site visit
- **Section 4** – **Emergency Response Areas:** describes areas of potential PFAS release at the facility, specifically in response to emergency situations
- **Section 5** – **Adjacent Sources:** describes sources of potential PFAS release adjacent to the facility that are not under the control of ARNG
- **Section 6** – **Conceptual Site Model:** describes the pathways of PFAS transport and receptors for the AOIs and the facility
- **Section 7** –**Conclusions:** summarizes the data findings and presents the conclusions of the PA
- **Section 8** – **References:** provides the references used to develop this document
- **Appendix A** – Data Resources
- **Appendix B** – Preliminary Assessment Documentation
- **Appendix C** – Photographic Log

1.4 Facility Location and Description

The St. Paul AASF Holman Field is in southern Ramsey County, Minnesota, approximately 2 miles southeast of the City of St. Paul (**Figure 1-1**). The facility is accessible from Trunk Highway 52 by Plato Boulevard or Eaton Street and Airport Road. The AASF is adjacent to the St. Paul Downtown Airport which is bordered by the Mississippi River on the north, east, and south and on the west by a railroad and USACE flood control levy (Metropolitan Airports Commission [MAC], 2010).

The AASF was constructed in the 1920s on a 4.25 acre parcel of land owned by the Metropolitan Airports Commission (MAC) and leased to the MNARNG. The current lease agreement expires on 30 September 2028 (**Appendix A**). The AASF facilities include a hangar for the operation, maintenance, and repair of MNARNG rotary-winged and fixed-wing aircraft, administrative offices, and classrooms.

1.5 Facility Environmental Setting

The AASF lies within the Twin Cities metropolitan area, which is characterized by rolling to hilly terrain with poorly drained depressions that form ponds and lakes. The Mississippi River forms ravines, surrounded bluffs, and steep slopes throughout the area, and relatively flat areas are found along the Mississippi River flood plain. The elevation of the facility is approximately 705 feet above mean sea level.

1.5.1 Geology

The AASF is situated in the St. Paul Baldwin Plains and Moraines Subsection of the Eastern Broadleaf Forest Province as defined by the Minnesota Department of Natural Resources (MNDNR) Ecological Classification System. The St. Paul Baldwin Plains and Moraines are characterized by Quaternary deposits directly overlying Cambrian or Ordovician bedrock formations. The bedrock formations form part of a gently sloping structure centered under the Minneapolis-St. Paul metropolitan area, known as the Twin Cities basin (WSB & Associates Inc., 2011). Naturally-occurring soils at the AASF generally consist of alluvium deposits approximately 100 feet deep from the retreating ice of the Wisconsin glaciation. Most of the Holman Field area was originally marsh land; however, several grading operations utilizing river dredge material, predominantly sand, and other common fill generally made up of sand, clay, silt, and broken limestone have been completed (MAC, 2010).

Soils classifications fall under the Chaska and Udorthents associations. These soils are generally described as level to very gently sloping. The Chaska soils are present in the southern marshy portions of the facility and are poorly drained soils subject to frequent flooding from the Mississippi River consisting of silt loam for approximately the top six inches. The Udorthents soils are also present and consist of variable permeability fill soils consisting of Mississippi River dredging materials and various fill materials made up of sand, clay, silt, and broken limestone (MAC, 2010).

1.5.2 Hydrogeology

The AASF is within the Metro Groundwater Province as defined by the MNDNR. Groundwater is drawn from surficial sand and gravel aquifers for domestic and irrigation wells and from deeper fractured and weathered bedrock or sedimentary rock for municipal or public supply wells (WSB & Associates Inc., 2011). Depth to groundwater in the area ranges from 0 to 25 feet below ground surface, with the shallowest wells closer to lakes, streams, and rivers. Groundwater flow is generally from the south to the east-northeast toward the Mississippi River (**Figure 1-2**). Surficial aquifers are recharged predominantly through infiltration of precipitation, although some recharge occurs from open water sources and during periods of high water levels (WSB & Associates Inc., 2011). Regional recharge of the five major bedrock aquifers occurs to the south in Freeborn and Mower Counties (WSB & Associates Inc., 2011).

No potable water wells are located within the boundary of the AASF (**Figure 1-2**). Several monitoring, commercial, and industrial wells are within 4 miles of the facility, and one domestic well is located less than one half mile due north of the facility. However, based on the east-northeast groundwater flow direction, this domestic well is not impacted by the facility. Drinking water for the AASF is supplied by the City of St. Paul, which obtains its municipal water through the St. Paul Regional Water Utility. The St. Paul Regional Water Utility predominantly uses the Mississippi River as its drinking water source although some water is supplied by groundwater aquifers (WSB & Associates Inc., 2011). The Mississippi River surface water intakes are located upgradient of the facility, approximately 18 miles north near Fridley, MN.

1.5.3 Hydrology

The Mississippi River borders the AASF to the north and east and is a significant resource for the area. However, three reaches of the Mississippi River and several lakes in the Harriet Island-Mississippi River Watershed are listed as impaired by the Minnesota Pollution Control Agency due to fecal coliform, polychlorinated biphenyl, PFOS, and mercury contamination and high turbidity. The largest lake near the AASF is Pigs Eye Lake, along the Mississippi River (**Figure 1-3**).

The AASF lies within the 100-year floodplain of the Mississippi River and contains wetlands along the eastern and southern boundary. In 2008, a floodwall was installed to protect against flooding (MAC, 2010).

1.5.4 Climate

The climate of St. Paul consists of warm to hot, humid summers and cold winters with moderate to heavy snowfall. Thunderstorms with heavy rainfall are common in the spring, summer, and fall. Seasonally, temperatures vary from summer highs of 85 degrees Fahrenheit (°F) to winter lows of 7 °F (World Climate, 2019). The average temperature is 42.85 °F. Average precipitation is 32.04 inches of rain and 54.4 inches of snow (World Climate, 2019). The prevailing wind varies from north to south, averaging 8 to 12 miles per hour, with artic air masses throughout the winter.

1.5.5 Current and Future Land Use

The AASF is a controlled access facility with public roads adjacent to the St. Paul Downtown Airport. The St. Paul Regional Airport is owned and operated by the MAC and provides corporate and military air service and a flight training school. The AASF is bordered by the Mississippi River to the north, south and east and a combination of mixed use commercial, office and industrial/utility land uses to the west (MAC, 2010). Residential areas are located northeast and southwest of the airport. Future land use developments are continually evaluated by the Joint Airport Zoning Board in regards to safety zone dimensions and development restrictions. Reasonably anticipated future land use is not expected to change from the current land use.

2. Fire Training Areas

The City of St. Paul currently provides fire emergency services for the AASF. According to the St. Paul Fire Chief, all fire training for the City of St. Paul is conducted at the St. Paul Fire Training Center, approximately 5.5 miles northwest of the AASF. The St. Paul Fire Training Center is located north of the Mississippi River. The AASF is located south of the Mississippi River; therefore, PFAS use at this location is unlikely to impact the AASF. The MNARNG does not train at the St. Paul Fire Training Center with the City of St. Paul Fire Department, and no FTAs where AFFF was used were identified within the AASF facility during the PA. Annual fire extinguisher training for the MNARNG was historically and is currently conducted using dish soap.

3. Non-Fire Training Areas

Two non-FTAs where AFFF was potentially stored or released were identified during the PA. A description of each non-FTA is presented below and shown on **Figure 3-1**.

3.1 South Hangar Ramp

Historically, the AASF had nine TriMax-30 fire extinguishers, one for training with dish soap, four for outdoor use supplied with 6 percent AFFF, and four for indoor use supplied with 3 percent AFFF. The TriMax-30 fire extinguishers were never used at the AASF for training or emergency response. In October 2013, the TriMax-30 fire extinguishers were replaced by seven 125-pound Purple K fire extinguishers. The TriMax fire extinguishers were emptied on the east side of the South Hangar Ramp prior to being returned to Camp Ripley for demilitarization (**Figure 3-1**). In total, approximately 12 gallons of AFFF concentrate were released during this event. The geographic coordinates are 44°56'19.1"N and 93°04'08.4"W. Two storm drains that drain to the Mississippi River to the north were noted on the ramp during the VSI. In addition, the AASF historically had bulk 3 percent and 6 percent AFFF in 5-gallon containers to be used to refill the TriMax fire extinguishers, if needed. According to interviewees, bulk AFFF was never used to refill the TriMax fire extinguishers. Bulk AFFF was returned to Camp Ripley with the TriMax fire extinguishers in 2013.

3.2 Fire Truck Storage Area

A fire truck was stored at the facility in the north hangar at the indoor wash rack (**Figure 3-1**) from 1987 to 1989 as a control measure because the AASF does not contain an AFFF fire suppression system. The geographic coordinates of the Fire Truck Storage Area are 44°56'22.7"N and 93°04'09.1"W. According to the former Fire Marshall, AFFF concentrate was transferred to the fire truck by pouring AFFF from 5-gallon containers into the tanks. No spills were noted. In addition, the former Fire Marshall indicated the fire truck did not have maintenance issues and was never used for emergency response or training. The nozzles on the fire truck were tested using water only; the proportioning valve was never tested. Periodically, the fire truck was washed in the hangar at the indoor wash rack. Water from the indoor wash rack drains to the oil water separator and then to the sanitary sewage. The fire truck was returned to Camp Ripley in 1989 or 1990.

4. Emergency Response Areas

No emergency response areas were identified within the AASF facility during the PA through interviews or document review. The City of St. Paul currently provides fire emergency services for the AASF. AFFF for fire emergency services is purchased by the City of St. Paul and stored at the city fire department. No AFFF is currently stored at the AASF.

5. Adjacent Sources

One potential off-facility source of PFAS adjacent to the AASF, not under the control of the MNARNG, was identified during the PA, the St. Paul Downtown Airport. The geographic coordinates of the airport are 44°56'31.1"N and 93°03'54.1"W (**Figure 5-1**). The St. Paul Downtown Airport was constructed in 1926 and is owned and operated by the MAC. The AASF is southwest and adjacent to the St. Paul Downtown Airport.

The St. Paul Downtown Airport is one of several reliever airports in the Twin Cities and consists of several private hangars, including hangars for the 3M Company, and the St. Paul Flight Center. The City of St. Paul Fire Department provides fire emergency services for the St. Paul Downtown Airport. Based on the interview with the City of St. Paul Fire Chief's, none of the hangars at the St. Paul Downtown Airport contain AFFF fire suppression systems, and AFFF has not been dispensed at the Holman Field Complex, including the AASF.

Several additional sources of PFAS in the St. Paul area, not adjacent to the AASF facility, were identified in a report by Delta Consultants titled *Perfluorocarbon (PFC)-Containing Firefighting Foams And Their Use In Minnesota.* These sources include a 3M Company plant, the Minneapolis-St. Paul International Airport / Minneapolis–Saint Paul Joint Air Reserve Station, refineries, marina fire locations, and landfills (**Figure 5-2**). The AASF is upgradient of these additional sources of PFAS; therefore, PFAS use at these locations is unlikely to impact the AASF.

6. Conceptual Site Model

Based on the PA findings, one AOI was identified at the AASF: AOI 1 South Hangar Ramp. The AOI location is shown on **Figure 6-1**. The following sections describe the CSM components and the specific CSMs developed for the AOI. The CSM identifies the three components necessary for a potentially complete exposure pathway: (1) source, (2) pathway, (3) receptor. If any of these elements are missing, the pathway is considered incomplete.

In general, the potential PFAS exposure pathways are ingestion and inhalation. Dermal contact is not considered to be a potential exposure pathway as studies have shown very limited absorption of PFAS through the skin (National Ground Water Association, 2018). Receptors at the St. Paul AASF Holman Field include site workers, construction workers, and trespassers. The CSM for the AASF indicates which specific receptors could potentially be exposed to PFAS.

6.1 AOI 1 South Hangar Ramp

AOI 1 is the South Hangar Ramp. One potential release of AFFF occurred in October 2013 when the TriMax fire extinguishers were emptied on the east side of the South Hangar Ramp by the MNARNG prior to being returned to Camp Ripley for demilitarization. In total, approximately 12 gallons of AFFF concentrate were released during this event.

PFAS are water soluble and can migrate readily from concrete to groundwater, which is estimated to be 0 to 25 feet below ground surface (WSB & Associates Inc., 2011). Because potential PFAS releases to concrete at AOI 1 have occurred, PFAS may migrate from the concrete to the groundwater via leaching. In addition, PFAS may have migrated from the concrete to storm water drains on the ramp via overland surface water flow. Storm water at the facility drains towards the Mississippi River to the north; therefore, the potential release may have impacted the surface water and sediments of the Mississippi River. Drinking water for the facility is supplied by the City of St. Paul, and no potable water wells exist within the boundary of the facility.

Ground-disturbing activities to concrete and intermittent surface water and sediment at AOI 1 and the Mississippi River could result in site worker, construction worker, and trespasser exposure to potential PFAS contamination. Therefore, the exposure pathways for inhalation and ingestion are potentially complete for these receptors. Ground-disturbing activities to subsurface soil could result in site worker and construction worker exposure via inhalation of soil particles and ingestion of subsurface soil. Therefore, the inhalation and ingestion pathways for these receptors are considered potentially complete. There are no potable water wells within the boundary of the AASF, and based on the east-northeast groundwater flow, domestic water supply wells are not impacted by the facility. Therefore, the exposure pathway for groundwater to residents through domestic drinking water ingestion is considered incomplete. The CSM for AOI 1 is shown on **Figure 6-2**.

7. Conclusions

This report presents a summary of available information gathered during the PA on the use and storage of AFFF and other PFAS-related activities at the St. Paul AASF Holman Field. The PA findings are based on the information presented in **Appendix A** and **Appendix B**.

7.1 Findings

One AOI related to potential PFAS release was identified (**Table 7-1**) at the AASF during the PA (**Figure 7-1**).

Table 7-1: AOIs at St. Paul AASF Holman Field

Area of Interest	Name	Used by	Potential Release Dates
AOI 1	South Hangar Ramp	MNARNG	October 2013

Based on potential AFFF releases at this AOI, there is potential for exposure to PFAS contamination in surface soil and intermittent surface water and sediments to site workers, construction workers, and trespassers via ingestion and inhalation of dust. Site workers and construction workers may also be exposed to potential PFAS contamination in subsurface soil via ingestion and inhalation of dust.

The following areas discussed in **Section 2** through **Section 5** were determined to have no suspected releases are summarized in **Table 7-2**.

Table 7-2: No Suspected Release Areas

No Suspected Release Area	Used by	Rationale for No Suspected Release Determination
Fire Truck Storage Area	MNARNG	The fire truck did not have maintenance issues and was never used for emergency response or training. The nozzles on the fire truck were tested using water only; the proportioning valve was never tested. No spills of AFFF were noted during transfer from bulk containers to the fire truck tanks.

7.2 Uncertainties

A number of information sources were investigated during this PA to determine the potential for PFAS-containing materials to have been present, used, or released at the facility. Historically, documentation of PFAS use was not required because PFAS were considered benign. Therefore, records were not typically kept by the facility or available during the PA on the use of PFAS in training, firefighting, or other non-traditional activities, or on its disposition.

The conclusions of this PA are predominantly based on the information provided during interviews with personnel who had direct knowledge of PFAS use at the facility. Sometimes the provided information was vague or conflicted with other sources. Gathered information has a degree of uncertainty due to the absence of written documentation, the limited number of personnel with direct knowledge due to staffing changes, the time passed since PFAS was first used (1969 to present), and a reliance on personal recollection. Inaccuracies may arise in

potential PFAS release locations, dates of release, volume of releases, and the concentration of AFFF used. There is also a possibility the PA has missed a source of PFAS, as the science of how PFAS may enter the environment continually evolves.

In order to minimize the level of uncertainty, readily available data regarding the use and storage of PFAS were reviewed, retired and current personnel were interviewed, multiple persons were interviewed for the same potential source area, and potential source areas were visually inspected. **Table 7-3** summarizes the uncertainties associated with the PA:

Table 7-3: Uncertainties

Area of Interest	Source of Uncertainty
All AOIs	No or limited information was available on the type, amount, and concentration of AFFF used at the facility prior to 1982.

Potential off-facility PFAS release areas exist adjacent to the AASF. These areas include property downgradient of the facility and are, therefore, unlikely to impact the AASF.

7.3 Potential Future Actions

Interviews and records (covering 1980s to present) indicate that ARNG activities may have resulted in potential PFAS releases at the AOI identified during the PA. Based on the CSM developed for the AOI, there is potential for receptors to be exposed to PFAS contamination in soil, surface water, and sediment at this AOI. **Table 7-4** summarizes the rationale used to determine if the AOI should be considered for further investigation under the CERCLA process and undergo an SI.

ARNG will evaluate the need for an SI at AOI 1 at the St. Paul Holman Field AASF based on the potential receptors, the potential migration of PFAS off the facility, and the availability of resources.

Table 7-4 PA Findings Summary

Area of Interest	AOI Location	Rationale	Potential Future Action
AOI 1 South Hangar Ramp	44°56'19.1"N 93°04'08.4"W	Approximately 12 gallons of AFFF concentrate used once in October 2013.	Proceed to an SI, focus on soil and groundwater

ARMY AVIATION SUPPORT FACILITY

LEASE AND USE AGREEMENT

Metropolitan Airports Commission
6040 28th Avenue South
Minneapolis Minnesota 55450

NATIONAL GUARD LEASE AND USE AGREEMENT

TABLE OF CONTENTS

ARMY AVIATION SUPPORT FACILITY
LEASE AND USE AGREEMENT

THIS ARMY AVIATION SUPPORT FACILITY ("AASF") LEASE AND USE AGREEMENT ("Lease") is made between the Metropolitan Airports Commission, a public corporation of the State of Minnesota, at 6040 28th Avenue South, Minneapolis, Minnesota 55450 ("Commission") and **Department of Military Affairs, State of Minnesota**, ("Tenant") **at 20 West 12th Street, St. Paul, Minnesota 55155-2098.**

WHEREAS, Commission owns and/or controls the real property at **St. Paul Downtown Airport** ("Airport") located in the County of **Ramsey**, State of Minnesota; and

WHEREAS, Tenant desires to lease property at the Airport adjoining the existing AASF for **the purpose of facilitating the operation of the AASF, which use will include** aircraft **tie-down, vehicular** storage**, fuel storage, and refueling of aircraft and motor vehicles used in Tenant's operation**; and

WHEREAS, Commission is willing to lease certain property to Tenant upon the terms and conditions of this Lease, which has been approved by the **Commission** on **May 17, 2004**.

WHEREAS, the parties desire to terminate the lease for the National Guard Hangar at St. Paul Downtown Airport dated December 21, 1959; and other agreements between the parties affecting the Premises; and

NOW, THEREFORE, in consideration of the foregoing, the parties agree as follows:

1. **Definitions**

   a. Ordinance 58

   "Ordinance 58" means Metropolitan Airports Commission Ordinance 58, which regulates conduct on the Commission's airports, as amended from time to time.

   b. **[Intentionally deleted]**

c. Ordinance 87

"Ordinance 87" means Metropolitan Airports Commission Ordinance 87, which establishes rental rates, fees and other charges to be paid at the Reliever Airports, as amended from time to time.

d. Policies

"Policies" means the Reliever Lease Policies, Rules and Regulations, and all the attachments, adopted by Commission effective November 1, 2000, and as amended from time to time.

e. **[Intentionally deleted]**

2. **Description of Premises**

a. Premises

Commission leases to Tenant and Tenant leases from Commission that portion of the Airport ~~commonly~~ referred to as **Guard Operations Area**, consisting of **185,610** square feet as shown on attached Exhibit A ("Premises"). ~~During the~~ term of this Lease, title to any improvements or fixtures located on the Premises is vested in Tenant subject to the Commission's rights in such improvements and fixtures pursuant to Section **16, below**.

b. **[Intentionally deleted]**

c. **[Intentionally deleted]**

3. **Use of Premises**

a. Use

The Premises shall be used by Tenant solely for the purpose of **operating an AASF, which use will include but not necessarily be limited to (i) aircraft tie-down, vehicular storage, or such other similar uses as may be required by Tenant, including using the fuel tanks and pumps located on the Premises for the refueling of aircraft and motor vehicles used in Tenant's operations**; (ii) for the storage of aircraft; and (iii) for maintenance performed by Tenant **in the course of operating the AASF.**

b. **[Intentionally deleted]**

4. **Term**

a. Initial Term

The term of this Lease shall be **twenty-five (25)** years ("Term"), commencing on **October 1, 2003** ("Commencement Date") and expiring, unless earlier terminated, on **September 30, 2028.**

b. Holding Over

If Tenant remains in possession of the Premises after the expiration of the Term, such holding over will only create a month to month tenancy, which may be terminated by either party at the end of any calendar month, upon thirty (30) days advance written notice. In the event of such holding over, Tenant shall perform all of the terms and conditions of this Lease, except the Rent and other charges which are paid annually to Commission shall be prorated on a monthly basis and paid monthly in advance.

c. Option to Extend

During the initial Term, Tenant has the right to extend the Term to a date twenty-five (25) years from the first day of a month following the date Tenant provides the Commission written confirmation of substantial completion of improvements made to the Premises paid for in whole or part by federal funding. Tenant has the right to extend the Term under this Section only for construction projects and minor construction projects intended to extend the useful life of the facility or to expand the capability of the premises (for example, to handle different aircraft). The right to extend the lease shall not extend to projects that are primarily for other purposes, such as maintenance, sustainment or restoration. To exercise the right to extend the Term in this circumstance, Tenant shall provide written confirmation of the date the improvements were substantially completed. Tenant's right to extend may never be exercised so that the last day of the Term is more than 25 years past September 30, 2028. Commission shall provide Tenant a written acknowledgment of Tenant's extension of the Term. The terms and conditions of the Lease during any extended Term will be as follows:

(1) The rental rate shall be the rate per square foot set forth in the then current version of Ordinance 87 for storage tenants at the St. Paul Downtown Airport and shall be subject to change in the same fashion as provided for in this Lease. The imposition of any such increase shall be

subject to the limitations on imposition set out in paragraph 5 c., below.

(2) The parties may negotiate and mutually agree upon the other terms and conditions.

(3) The right to extend shall be contingent upon the Tenant being in compliance with the substantial terms of this Lease, which shall be determined by an inspection performed by the Commission in accordance with Section 9.

d. Cancellation by Tenant Due to Federal Funding

Tenant's ability to pay Rent is dependent on sufficient State or Federal appropriations being made. If funding is not appropriated for payment of Rent, Tenant may terminate this Lease upon advance written notice to Commission at least 90 days prior to termination.

e. Cancellation by Tenant if Other Facilities are Constructed

In the event Tenant constructs a new facility at St. Paul Downtown Airport for substantially the same purpose as the current AASF, Tenant shall terminate this Lease by giving Commission advance written notice not less than 365 days prior to such termination. In the event Tenant constructs a new facility at a location other than St. Paul Downtown Airport for substantially the same purpose as the current AASF, Tenant may, at its option, terminate this Lease by giving Commission advance written notice not less than 365 days prior to such termination.

5. **Rent**

a. Rent

Tenant shall pay Commission rent for the Premises in the amount of **.35¢ per square foot for the period from October 1, 2003 through September 30, 2004. For each subsequent federal fiscal year of this Lease, Tenant shall pay Commission rent for the Premises in the amount of the "per square foot" rental rates applicable to storage tenants at St. Paul Downtown Airport set forth in MAC Ordinance 87, subject to subparagraph c., below ("Rent").** Rent shall be paid to Commission at the address specified by Commission. Rent shall be paid annually in advance on or before the Commencement Date and each anniversary of the

Commencement Date, unless Tenant is notified in writing by Commission of different payment dates.

b. **[Intentionally deleted]**

c. Revision of Rents

Under Minn. Stat. § 473.651, Commission has the authority to determine the charges for the use of property under its management and control, and accordingly Commission reserves the right, from time to time, to amend rents, charges and assessments hereunder, either upwards or downwards. **Lessor understands that Tenant's ability to pay charges beyond those specifically set out herein is dependent upon funding increases from the State of Minnesota or the Federal Government. Lessor therefore agrees to provide reasonable notice of a proposed increase. Commission shall make actual imposition of any increases, including, but not limited to any increases provided for under MAC Ordinance 87, contingent on Tenant's receipt of the proposed increase in funding from the state or federal government to pay for increased charges. Tenant agrees to make timely and proper applications for funding from the state and federal government and to use good faith efforts to obtain such funding and pay for such increases. Tenant agrees to provide Commission copies of all such applications when made.**

d. **[Intentionally deleted]**

6. **Taxes and Other Charges**

a. Utilities

Tenant shall pay for all water, sanitary sewer, gas, electricity, telephone, refuse collection, storm sewer charges or other similar charges used on or attributable to the Premises, together with any taxes, penalties, interest or surcharge associated with such utilities and charges.

b. Assessments Imposed by Commission

Tenant shall pay Commission for assessments imposed in accordance with Section X.D. of the Policies and Ordinance 87. **Lessor agrees to provide reasonable notice of an assessment, and Tenant shall pay that cost in installments as specified by an agreement between the parties. Lessor understands that Tenant's ability to pay charges beyond those specifically set out herein is dependent upon funding increases from the State of**

Minnesota or the Federal Government. Commission shall make actual imposition of such assessments contingent on Tenant's receipt of the proposed increase in funding from the state or federal government to pay for such charges. Tenant agrees to make timely and proper applications for funding from the state and federal government and to use good faith efforts to obtain such funding and pay for such charges. Tenant agrees to provide Commission copies of all such applications when made.

c. Taxes and Fees Imposed by Other Authorities

(1) **Commission shall not be responsible for any taxes, fees, assessments, or other charges imposed by any other governmental authority during the Term of this Lease upon the Premises, buildings, improvements or property located thereon, or upon Tenant's use or occupancy, for whatever term deemed applicable to Tenant by that governmental authority. If such fees apply to Tenant, Tenant shall pay such fees. Lessor understands that Tenant's ability to pay fees beyond those specifically set out herein is dependent upon funding increases from the State of Minnesota or the Federal Government. Tenant agrees to make timely and proper applications for funding from the state and federal government and to use good faith efforts to obtain such funding and pay for such fees. Tenant agrees to provide Commission copies of all such applications when made.**

(2) In the event that any governmental authority imposes an assessment upon the Airport for improvements the Tenant requested from the governmental authority, then Commission shall have the option to charge Tenant for the cost of such assessment. Tenant shall pay that cost in installments as specified by **an agreement between the parties.**

7. **Compliance with Laws**

a. Compliance with Laws

Tenant shall comply with all applicable local, municipal, county, state and federal laws, regulations, rules and ordinances, now or hereafter in force, including those of Commission, **to the extent Tenant is permitted under applicable state or federal law or except as otherwise necessary for military operations**. Tenant may obtain a copy of Commission's ordinances, rules and regulations by contacting Commission. In the event of a conflict between this Lease and a Commission ordinance, the ordinance governs.

b. Reliever Lease Policies, Rules and Regulations

The terms and conditions of the Reliever Lease Policies, Rules and Regulations, and all attachments thereto **relating to operations conducted on the premises** are incorporated into this Lease. Tenant agrees to comply with the Policies, as amended from time to time, **to the extent Tenant is permitted under applicable state or federal law or regulation and except as otherwise necessary for military operations.** If there is a conflict between Lease and the Policies, this Lease shall control. Tenant may obtain a copy of the current Policies by contacting Commission. Tenant acknowledges that Tenant has received a copy of the Policies previously or upon execution of this Lease. **Provisions of said Reliever Lease Policies Rules and Regulations and attachments thereto that relate to payments to be made by tenants are not applicable because the parties contemplate that the only payments to be made under this Lease are the rental payments specifically provided for herein.**

c. **[Intentionally deleted]**

d. **[Intentionally deleted]**

8. **Quiet Enjoyment**

Upon Tenant's payment of Rent and performance of all the terms of this Lease, Tenant shall have quiet possession of the Premises for the entire Term subject to all of the Provisions of this Lease. However, Commission and its designated representatives have the right to enter the Premises for the purpose of making repairs or improvements to any adjoining premises or the Airport and to install, repair, maintain and construct through the Premises such pipes, wires and other similar items as Commission deems necessary or desirable for the operation of the Airport, **except as restricted by applicable law or military regulation relating to military aircraft, equipment, or other property.** In doing so, Commission shall use reasonable diligence to minimize disruption to Tenant's use and enjoyment of the Premises, and shall reasonably repair any damage caused by such entry.

9. **Inspection**

Commission has the right to inspect the Premises and any improvements and property located on the Premises in accordance with Section XIII.B. of the Policies, **except as restricted by applicable law or military regulation relating to military aircraft, equipment, or other property.**

10. **Construction and Improvements**

a. **[Intentionally deleted]**

b. Approval

(1) **Work, including** rebuilding, repair, fencing, outdoor signs, use of a crane, utility installation, and other work set forth in Section XX.C. of the Policies, **may not begin without the prior written consent of Commission's staff, which shall not be unreasonably withheld. However, prior written consent is not required for preventative maintenance.**

(2) **All construction and maintenance shall be at no cost to Commission and, at the request of Commission, subject to removal by Tenant of all property, equipment and fixtures and, if Commission deems it necessary, the restoration of the Premises on termination of this Lease.**

(3) **Plans from a responsible contractor for the Work must be submitted to Commission's staff for approval prior to the commencement of the Work. Commission has no duty to determine whether Tenant's plans or construction comply with applicable laws, ordinances, rules and regulations.**

(4) Tenant shall only proceed with the Work after approval from Commission's staff and after obtaining all necessary government building permits and approvals and providing copies to Commission, if requested.

c. Completion

(1) Tenant shall complete any and all work, including Work subject to Commission approval in Section 10.b., at Tenant's cost. In completing any type of work of any amount Tenant shall do or cause all work to be done in a good and workmanlike manner, within a reasonable time and in compliance with the Policies and applicable insurance

requirements, building codes, zoning ordinances, laws and regulations.

(2) **Commission will not defend and is not responsible for any liens** asserted or filed against the land, or any part thereof, or against this Lease or any building, structure or improvement on the Premises, **or for any** judgments resulting from such **liens.**

11. **Maintenance**

a. Tenant shall, at its own cost and expense, take good care of the Premises, and all improvements, buildings, structures or property located on the Premises and shall keep and maintain them in good order and repair and in a clean and neat condition. Tenant or any other individual or entity that acquires title to improvements or fixtures located on the Premises from Tenant, including, but not limited to, a leasehold mortgagee, judgment creditor or subtenant, may, without regard to the Commission's rights in the improvements and fixtures pursuant to Sections 15. and 16. but subject to the requirements set forth in this Section 11., remove improvements or fixtures from the Premises. An individual or entity intending to remove improvements or fixtures must give prior written notice to the Commission. If only fixtures are removed, the individual or entity removing the fixtures must repair any damage to the remaining improvements or fixtures and remove and properly dispose of any debris resulting from the removal of the fixtures. If improvements are removed, the individual or entity removing the improvements must: (i) remove and properly dispose of any debris resulting from the removal of the improvements; (ii) return the Premises to a buildable condition; (iii) remediate, to the reasonable satisfaction of the Commission, any environmental contamination existing on the Premises arising out of Tenant's past or present operations on the Premises or the Airport; and (iv) remove, seal or abandon in place, as reasonably required by Commission staff, any above ground or underground storage tanks, septic systems or wells located on the Premises. The obligations in the proceeding sentence shall survive termination of this Lease. For purposes of this Section 11., any hangar located on the Premises is an "improvement" and not a "fixture". The individual or entity removing the improvements or fixtures must provide the Commission with an escrow deposit at the time of notification of removal, in an amount the Commission staff reasonably determines, or other assurances acceptable to the Commission staff, in its discretion, to ensure the individual or entity's full performance of their obligations under this Section 11. Failure to comply with this Section shall be a Lease default under Section 18.a.(9).

b. Tenant shall not suffer or permit any waste or nuisance on the Premises that shall interfere with the rights or other tenants or Commission in connection with the use of Airport property not leased to Tenant.

12. **Insurance and Liability**

a. Insurance

Effective as of the earlier of the date Tenant enters or occupies the Premises or the Commencement Date, and continuing during the Lease Term, Tenant, at its expense, shall maintain in force the following insurance coverage:

(1) **Tenant shall either (i) elect to rely upon the Minnesota Tort Claims Act and/or the Federal Tort Claims Act as these Acts apply to the Tenant's operations, or (ii) maintain insurance, with underwriters satisfactory to Commission, with a standard term policy or policies of insurance in amounts equal to or greater than those afforded under the Minnesota Tort Claims Act and/or the Federal Tort Claims Act as those Acts apply to Tenant's operations. If the Tenant elects to obtain insurance, all policies shall name Commission as additional insured.**

(2) Worker's compensation insurance, **as required by law, either (i) self insurance as specified by applicable state of federal law, or (ii) maintain insurance, with underwriters satisfactory to Commission. Tenant will also be responsible to insure that all subcontractors, where applicable, provide workers compensation as required by law.**

b. **[Intentionally deleted]**

c. **Liability**

(1) **Except as otherwise provided in this Agreement, Tenant and Commission agree that neither party shall be liable for damages to property or injuries to individuals arising from acts of the other under the terms of this Agreement or occurring as a consequence of the performance of responsibilities under this Agreement.**

(2) **Tenant and** Commission **agree that each** shall give reasonable notice of any such claim or action. **Each party**

shall provide to **each other** all information, records, statements, photographs, video, or other documents reasonably necessary to defend any claims, **except as restricted by applicable law or military regulation.**

(3) The provisions of this Section shall survive expiration or earlier termination of this Lease.

d. Appropriate Use

Tenant shall not use or permit the Premises to be used in any manner **other than as described in this Agreement without the written approval of Commission.**

13. **Damage or Destruction**

a. Commission's Termination Right

If the Airport is damaged by fire or other casualty to an extent that Commission reasonably determined to discontinue operation of the Airport for twenty-four (24) months or more, Commission has the right to terminate this Lease by notifying Tenant within sixty (60) days of the damage or destruction. If Commission terminates this Lease, all rent and other charges due to Commission shall cease as of the date of the damage or destruction.

b. Rent Abatement

If Tenant, through no fault of its own, suffers loss: (i) by being prevented beyond a reasonable length of time, from using the public portion and public facilities of the Airport due to flooding or for reasons other than those occasioned by meteorological conditions; or (ii) because any governmental agency through its sovereign power, beyond a reasonable length of time, stops, suspends or seriously limits the Tenant's use of the public portion and public facilities of the Airport; then Tenant during such periods shall not be liable for any Rent provided the Premises are not used by Tenant or subtenants of Tenant. In these situations, Tenant shall not be entitled to any compensation for loss or damage from Commission other than this rent abatement.

c. Tenant's Termination Right

If the improvements on the Premises are damaged by fire or other casualty, Tenant shall either terminate this Lease or restore, replace and rebuild the improvements to the same or better condition. Tenant's election must be provided to Commission in writing within sixty (60) days of the damage.

(1) If Tenant elects to Terminate this Lease, Tenant must: (i) remove any debris and eliminate any environmental contamination caused by the damage; (ii) return the Premises to buildable condition; and (iii) surrender the Premises in accordance with the terms and conditions of this Lease. This Lease, and all rent and other charges due to Commission, shall not terminate unless and until Tenant fulfills such obligations.

(2) If Tenant elects to restore the improvements, Tenant must: (i) remove any debris and eliminate any environmental contamination caused by the damage; (ii) return the Premises to buildable condition; (iii) rebuild the improvements, to the same or better condition in compliance with the requirements of Section 10. If Tenant elects to restore the improvements but this Lease is terminated before restoration is complete, then Tenant must comply with the removal requirements set forth in Section 11.

All of the above must be fulfilled within twelve (12) months of the date of such damage, plus any additional period reasonably granted by Commission's staff due to delays beyond Tenant's reasonable control.

14. **[Intentionally Deleted]**

a. **[Intentionally deleted]**

b. **[Intentionally deleted]**

c. **[Intentionally deleted]**

15. **[Intentionally deleted]**

16. **Surrender of Premises by Tenant**

a. Upon the expiration or termination of this Lease, except as set forth in Sections 13., Tenant must either remove all improvements and fixtures, (in which case Tenant must comply with all requirements of Section 11.) or transfer ownership of the improvements to a prospective tenant, which must be approved by Commission. Commission's approval of such a transfer will not be unreasonably withheld. If Tenant does not accomplish this within ninety (90) days of the termination or expiration of this Lease, or within a reasonable extension of time if more than ninety (90) days is needed, Commission becomes the owner of the improvements, except as stated below. Commission will then use commercially reasonable efforts to sell the improvements; however, Commission shall not be required to make any upgrades or repairs for purposes of selling the improvements. Commission is entitled to determine the terms of the sale in its sole and absolute discretion. In the event Commission is unable to sell the improvements within 180 days of acquiring ownership, Commission shall have the option to discontinue marketing the improvements and may thereafter demolish the improvements. Commission may, after demolition of the improvements, lease the Premises to another tenant. The foregoing notwithstanding, if below average market conditions have attributed to the inability of Commission to sell the improvements, and the improvements are not hazardous to public health or safety, the 180 day period shall be extended an additional 180 days or such longer period as is reasonably determined by Commission prior to demolition thereof.

b. If Commission sells the improvements, the proceeds from the sale will be used first to: (a) satisfy any debts due to Commission from Tenant including, but not limited to, rent, late fees, interest, penalties, attorney fees and all costs of collections, and (b) to reimburse Commission for all reasonable costs of acquisition, administration and sale of the buildings, including, but not limited to attorneys' fees, appraisal and marketing costs, brokerage fees or commissions, repair and remodeling of the improvements, any environmental studies conducted by Commission, and any costs incurred by Commission to bring the buildings and other improvements into compliance with all applicable laws, including environmental laws. Any proceeds remaining after payment of all costs of Commission shall be paid to Tenant. Any amount received by Commission as a result of the sale of improvements shall not in any way limit Tenant's liability to Commission for amounts owing to Commission pursuant to the terms and conditions of this Lease.

c. Fuel and other tanks, wells and septic systems remain the property of the Tenant and must be, at the sole option of Commission, and at the sole cost and expense of Tenant: (a) removed, properly abandoned by Tenant in compliance with all applicable laws; (b) repaired, modified, or upgraded by Tenant; or (c) transferred to a new tenant having a lease on the Premises.

17. **[Entire Section Intentionally Deleted]**

18. **Default**

a. Events of Default

Any of the following shall constitute a default under this Lease:

(1) Tenant fails to pay money owed to Commission under this Lease when due, and such failure continues for ten (10) days after written notice from Commission to Tenant.

(2) Tenant uses the Premises for any purpose not authorized by this Lease and such default continues for ten (10) days following written notice from Commission to Tenant.

(3) Tenant fails to allow an inspection in accordance with the terms and conditions of this Lease and such default continues for ten (10) days following written notice from Commission to Tenant.

(4) Tenant assigns, subleases or transfers this Lease except as otherwise permitted, and such default continues for ten (10) days following written notice from Commission to Tenant.

(5) **[Intentionally deleted]**

(6) Tenant vacates or abandons the Premises, and such default continues for ten (10) days following written notice from Commission to Tenant.

(7) **[Intentionally deleted]**

(8) Tenant (a) makes a general assignment for the benefit of creditors; (b) commences any case, proceeding or other action seeking to have an order for relief entered or to adjudicate Tenant bankrupt or insolvent, or seeking reorganization, arrangement, adjustment, liquidation, dissolution or composition of it or its debts or seeking appointment of a receiver, trustee, custodian or other similar

official for it or for all of any substantial part of its property; or (c) involuntarily becomes the subject of any proceeding for relief which is not dismissed within sixty (60) days of its filing or entry.

(9) Tenant fails to comply with any other **material** term or condition of this Lease and such default continues for more than thirty (30) days after written notice from Commission to Tenant, or for a longer period of time as may be reasonably necessary to cure the default, but only if: (i) Tenant is reasonably capable of curing the default, and (ii) is working diligently as determined by Commission to cure the default.

b. Commission Remedies

If a **material** default occurs, Commission, at its option and in its sole discretion, may at any time thereafter do one or more of the following to the extent permitted by applicable law **or military regulation**:

(1) Commission may, without releasing Tenant from its obligations under the Lease, attempt to cure the default. Commission may enter the Premise for such purpose and take such action as it deems desirable or appropriate to cure the default. This entry is not an eviction of Tenant or a termination of this Lease;

(2) With legal process, but without further notice to Tenant, re-enter the Premises or any part thereof and take possession of it fully and absolutely, without such re-entry working a forfeiture of the money to be paid and the terms and conditions to be performed by Tenant for the full Term of this Lease. Commission's re-entry of the Premises is not a termination of this Lease. In the event of such re-entry, Commission may proceed for the collection of money to be paid under this Lease or for properly measured damages;

(3) Terminate this Lease upon written notice to Tenant and re-enter the Premises as of its former estate, **and** implement the provisions of Section 16.; and

(4) Exercise all other rights and remedies including injunctive relief, ejectment or summary proceedings such as an eviction action and any other lawful remedies, actions or proceedings.

c. Cumulative Default

Notwithstanding the notice and cure periods set forth above, and subject to the inspection procedures set forth in the Policies, Commission shall only be required to provide Tenant with notice and opportunity to cure two (2) Cumulative Defaults in any calendar year. Only for purposes of this paragraph, Cumulative Default means: (i) Tenant's failure to pay money due under this Lease; (ii) Tenant's failure to comply with the use of Premises section of this Lease; and (iii) any **material** violation of the terms and conditions of this Lease which has the likelihood in Commission's reasonable discretion to cause harm to life or property. In addition, Commission shall only be required to provide Tenant with notice and opportunity to cure two (2) defaults of failing to allow an inspection of the Premises in any calendar year. Beginning with the third (3rd) Cumulative Default or third (3rd) failure to allow an inspection in any calendar year, Commission will not be required to provide notice and opportunity to cure and may immediately take such action as Commission deems appropriate under this Lease.

d. **[Intentionally deleted]**

19. **Environmental Responsibilities**

a. Definitions

(1) "Environmentally Regulated Substances" means any element, compound, pollutant, contaminant, or toxic or hazardous substance, material or waste, or any mixture thereof, regulated pursuant to any Environmental Law, including but not limited to products that might otherwise be considered of commercial value, such as asbestos, polychlorinated biphenyls, petroleum products and byproducts, glycol and other materials used in de-icing operations.

(2) "Environmental Law" means any common law or duty, case law or ruling, statute, rule, regulation, law, ordinance or code, whether local, state or federal **which is applicable to Tenant's activities under this Lease** that regulates, creates standards for or imposes liability or standards of conduct **concerning** any element, compound, pollutant, contaminant, or toxic or hazardous substance, material or waste, or any mixture thereof, including but not limited to products that might otherwise be considered of commercial value, such as asbestos, polychlorinated biphenyls, petroleum products and

byproducts, glycol and other materials used in de-icing operations.

b. **Liability**

(1) **Except as otherwise provided in this Agreement, Tenant and Commission agree that neither party shall be liable for damages to property or injuries to individuals arising from acts of the other under the terms of this Agreement or occurring as a consequence of the performance of responsibilities under this Agreement.**

(2) **Tenant and Commission agree that each shall give reasonable notice of any such claim or action. Each party shall provide to each other all information, records, statements, photographs, video, or other documents reasonably necessary to defend any claims, except as restricted by applicable law or military regulation.**

(3) **The provisions of this Section shall survive expiration or earlier termination of this Lease.**

c. Compliance with Environmental Laws

Tenant shall keep and maintain and shall conduct its operations on the Premises and Airport in full compliance with all applicable Environmental Laws. Tenant shall further ensure that its employees, agents, contractors and subcontractors occupying or present on the Premises and Airport comply with all applicable Environmental Laws. By virtue of its operational control of the Premises, Tenant shall be fully responsible for obtaining all necessary permits or other approvals under the Environmental Laws and shall have full responsibility for signing and submitting any necessary applications, forms, documentation, notifications, certifications, or other governmental submittals relating thereto. Upon the request of Commission, Tenant shall provide copies to Commission of any such applications, forms, documentation, notifications or certifications.

Tenant agrees that any **future** installation of tanks, wells or septic systems shall only occur if such installations are in compliance with applicable **law and regulation**, and only after prior written approval of Commission. Notwithstanding the above, Tenant accepts title and ownership to (i) any tanks, septic systems or wells existing on the Premises at the time of execution of this Lease and used by the Tenant in its operations, and (ii) any tanks, septic systems or wells installed at any time during the Term of this Lease.

d. Testing and Reports

Tenant shall provide to Commission, within ten (10) days of receipt, a copy of any notice regarding a violation of the Environmental Laws arising out of Tenant's past or present operations on the Premises and Airport, a copy of any report, whether in final or draft form, regarding compliance with Environmental Laws or with the presence, use, emission or release of any Environmentally Regulated Substances arising out of Tenant's past or present operations on the Premises and Airport, or a copy of any notice of the emission or release of Environmentally Regulated Substances in violation of the Environmental Laws arising out of Tenant's past or present operations on the Premises and Airport. If Commission has a reasonable basis to believe that Tenant is not meeting the obligations of Section 19.c. hereof, Commission may require Tenant to perform reasonable environmental studies or assessments (for example, but not limited to, Phase I or Phase II reports as such terms are generally known on the date of execution of this Lease) on the Premises with the written results being delivered to the Commission within ten (10) days of their receipt, whether in draft or final form.

e. Notification

Tenant shall immediately notify Commission in writing of any matter Tenant obtains knowledge of that constitutes any emission, spill or release or any threatened emission, spill or release of any Environmentally Regulated Substance in, on, under or about the Premises and Airport arising out of Tenant's past or present operations which is or may be in violation of the Environmental Laws. Tenant shall promptly notify Commission verbally of any fuel spill or any other spill caused or resulting from Tenant's operations on the Premises and Airport.

f. Right to Investigate

Commission shall have the right, but not the obligation or duty, anytime from and after the date of this Lease, to investigate, study and test the Premises, at Commission's own expense, and without unreasonably interfering with Tenant's operations on and use of the Premises, to determine whether Environmentally Regulated Substances are located in, on or under the Premises, or were emitted or released therefrom, which are not in compliance with Environmental Laws. Commission's investigation of the Premises under this provision shall be in accordance with the subject to the Inspection Procedures established in the Policies. Commission shall pay Tenant the cost to repair any damage to the Premises caused by Commission's investigation, study or testing.

g. Right to Take Action

Commission shall have the right, but not the duty or obligation, to take whatever reasonable action it deems appropriate to protect the Premises and Airport from any material impairment to its value resulting from any escape, seepage, leakage, spillage, discharge, deposit, disposal, emission or release of Environmentally Regulated Substances from the Premises and Airport which violates any Environmental Law and arises out of Tenant's past or present operations on the Premises and Airport. Commission shall notify Tenant of its intention to take such action in writing thirty (30) days before proceeding under this section. Within such thirty (30) day period, Tenant shall have the opportunity to take whatever reasonable action is deemed appropriate by Commission to cure the matter of concern or provide Commission a binding commitment to do so within a reasonable time. If Tenant does not take such action or provide a binding commitment within the thirty (30) day period, Commission may proceed under the terms of this Section 19.

h. Claims Relating to Environmentally Regulated Substances

Tenant represents and warrants that, since the time Tenant commenced operations on the Premises or took or assumed an interest in the Premises, to the best of Tenant's knowledge (except for matters that have been corrected in accordance with law) (i) no enforcement, investigation, cleanup, removal, re-mediation or response or other governmental or regulatory actions have, or could have at any time, been asserted or threatened with respect to Tenant's past or present operations conducted on the Premises or Airport, or the Premises itself, or against Tenant with respect to or in any way regarding the Premises, pursuant to any Environmental Laws, or relating to Environmentally Regulated Substances; (ii) no violation or noncompliance with Environmental Laws has occurred with respect to the Premises or Tenant's past or present operations thereon; (iii) no claims with respect to the Premises or Tenant's past or present operations thereon, or against the Tenant with respect to the Premises or Airport or Tenant's past or present operations thereon relating to Environmental Laws or Environmentally Regulated Substances, have been made or been threatened by any third party, including any governmental entity, agency or representative. For purposes hereof, "the best of Tenant's knowledge" shall mean the actual knowledge (without any duty to inquire) of the person within the Tenant's operations that has the primary responsibility for ensuring compliance with Environmental Laws.

20. **Non-Discrimination**

a. General

Tenant, for itself, and its heirs, representatives, successors and assigns, as part of the consideration herein, hereby covenants and agrees, as a covenant running with the land, that (1) no person, on the grounds of race, color, or national origin shall be excluded from participation in, denied the benefits of, or be otherwise subjected to discrimination in the use of the Premises; (2) that in the construction of any improvements on, over, or under the Premises, and the furnishing of services thereon, no person on the grounds of race, color, or national origin shall be excluded from participation in, denied the benefits of, or otherwise be subjected to discrimination; and (3) Tenant shall use the Premises in compliance with all other **applicable** requirements imposed by or pursuant to Title 49, Code of Federal Regulations, Department of Transportation, Subtitle A, Office of the Secretary, Part 21, Non-Discrimination in federally Assisted Programs of the Department of Transportation – Effectuation of Title VI of the Civil Rights Act of 1964, as amended from time to time.

b. Improvements

Tenant, for itself, and its heirs, representatives, successors and assigns, as part of the consideration herein, hereby covenants and agrees, as a covenant running with the land, that in the event improvements are constructed, maintained or otherwise operated on the Premises for a purpose for which a program or activity of the Department of Transportation is extended or for another purpose involving the provision of similar services or benefits, Tenant shall operate such improvements and services in compliance with all other **applicable** requirements imposed by or pursuant to Title 49, Code of Federal Regulations, Department of Transportation, Subtitle A, Office of the Secretary, Part 21, Non-Discrimination in Federally Assisted Programs of the Department of Transportation – Effectuation of Title VI of the Civil Rights Act 1964, as amended from time to time.

c. **[Intentionally Deleted]**

21. **Civil Rights**

Tenant agrees that it will comply with applicable laws, statutes, Executive Orders and rules that are promulgated to assure that no person shall, on the grounds of race, creed, color, national origin, sex, age, or handicap be excluded from participating in any activity conducted with or benefiting from federal assistance.

This provision obligates Tenant or its transferee for the period during which federal assistance is extended to the Airport, except where federal assistance is to provide, or is in form of personal property or real property or interest therein or structures or improvements thereon. In these cases, the provision obligates the party or any transferee for the longer of the following periods: (1) the period during which the property is used by the sponsor or any transferee for a purpose for which federal assistance is extended, or for another purpose involving the provision of similar services or benefits; or (2) the period during which the Airport sponsor or any transferee retains ownership or possession of the property.

22. **Commission's Operation of the Airport**

Commission shall properly maintain, operate and manage the Airport at all times in a safe manner, according to generally accepted good practices in the State of Minnesota for airports of similar size and character. If for any reason beyond the control of Commission (including, but not limited to, war, strike, riots, and civil commotion), Commission fails to properly maintain, operate or manage the Airport, such failure is not a breach of this Lease and Commission is not liable in damages. This paragraph does not require Commission to operate an airport traffic control tower at the Airport unless, in the judgement of Commission, such is deemed necessary, nor does this paragraph bind Commission to maintain the Premises.

23. **Use**

a. **Subject to the terms and conditions of this Lease, Tenant shall have the use, in common with other users of the airport of the Jointly Used Flying Facilities, together with all necessary and convenient rights of ingress and egress to and from the Jointly Used Flying Facilities, the AASF, and the Premises.**

b. **The parties agree that the current level of use of the Jointly Used Flying Facilities at the Airport by the Tenant does not constitute a "substantial use" as defined under Title 49, United States Code, Chapter 471 "Airport Development" (49 U.S.C. Sections 47101-47129). Accordingly, the Tenant's use of said facilities meets the criteria for use without charge under Chapter 471, which provides that, in airports developed with financial assistance from the United States, facilities usable for the takeoff and landing of aircraft will be available without charge for use by Government aircraft in common with other aircraft, so long as such use is not substantial.**

c. **In the event that the nature or extent of the Tenant's use changes so as to constitute a substantial use as set out in said Chapter 471, the parties shall either amend this Lease or enter**

into a separate agreement concerning said Jointly Used Flying Facilities.

d. For the purposes of this Lease, the Jointly Used Flying Facilities at the Airport are the runways, taxiways, lighting systems, navigational aids, markings and appurtenances, including all improvements and facilities pertaining thereto and situated thereon and all future addition, improvements and facilities thereto as may be added or constructed from time to time. The Jointly Used Flying Facilities do not include land areas used exclusively by Tenant or the terminal buildings, hangars, non-government parking aprons and ramps or other areas used exclusively by the Commission or its lessees, permittees, or licensees for civilian or commercial purposes.

24. Use Not Exclusive

Tenant shall have the right to conduct all operations authorized pursuant to the terms of this Lease, provided, however, that this Lease shall not be deemed to grant to Tenant, or those claiming under Tenant the exclusive right to use any part or portion of the Airport other than the Premises.

25. General Provisions

a. Airport Access

Tenant has the privilege of using the public portions of the Airport, such as runways and other public facilities, under such terms, ordinances, rules and regulations as now exist or may be enacted by Commission, and subject to charges for such use as may be established by Commission, by ordinance or agreement with Tenant.

b. Waiver

The waiver by Commission or Tenant of any breach of any term of this Lease shall not be deemed a waiver of any prior or subsequent breach of the same term or any other term of this Lease.

c. Headings

The headings in this Lease are for convenience in reference and are not intended to define or limit the scope of any provision of this Lease.

d. Entire Agreement

This Lease represents the entire agreement between the parties and supercedes any prior agreements regarding the Premises. This Lease may only be modified if done in writing and executed by both parties.

e. **Termination of Old Agreements**

This Lease terminates the agreement dated December 21, 1959, by and between the Armory Board, National Guard Hangar, Holman Field, St. Paul, Minnesota, and the Minneapolis-St. Paul Metropolitan Airports Commission and any other agreements between the parties affecting the premises.

f. Severability

If any part of this Lease shall be held invalid, it shall not affect the validity of the remaining parts of this Lease, provided that such invalidity does not materially prejudice either party under the remaining parts of this Lease.

g. Governing Law

This Lease shall be governed by Minnesota Law, **except as superceded by applicable federal law or regulation.**

h. Public Data

Commission shall use reasonable care to treat matters pertaining to Tenant's business in a confidential manner to the extent permitted by law. This Lease, and the information related to it, are subject to the Minnesota Government Data Practices Act, which presumes that data collected by Commission is public data unless classified otherwise by law.

i. Commitments to Federal and State Agencies

Nothing in this Lease shall be construed to prevent Commission from making such commitments as it desires to the Federal Government or the State of Minnesota in order to qualify for the expenditure of Federal or State funds on the Airport.

j. Successors

This Lease shall extend to bring the legal representatives, successors and assigns of the parties to this Lease.

k. Relationship of Parties

Nothing contained in this Lease shall be deemed to create a partnership, association or joint venture between Commission and Tenant, or to create any other relationship between the parties other than that of landlord and tenant.

l. Multiple Parties

If more than one person or entity is named as the Tenant, the obligations of the Tenant shall be the joint and several responsibilities of all persons or entities named as Tenant.

m. Consent and Approvals

Whenever in this Lease the consent or approval of Commission is required, such phrase means the formal approval or consent of Commission through a meeting of the Metropolitan Airports Commission. When the consent or approval of Commission's staff is required, such phrase means the consent or approval from the appropriate employee or agent of Commission.

n. Notice

Any notice required under this Lease shall be in writing and delivered in person or by courier or mailed by certified mail, return receipt requested by United States Mail, postage prepaid addressed as follows:

Commission: Metropolitan Airports Commission
Attn: Manager of Administration, Reliever Airports
6040 28th Avenue South
Minneapolis, Minnesota 55450-2799

Tenant: The address in the first paragraph of this Lease

Notice is deemed given (i) two business days after being deposited in the mail, whether or not the notice is accepted by the named recipient, or (ii) if delivered by any other means, the date such notice is actually received by the named recipient. Either party may change

the party's address for notice by providing written notice to the other party.

IN WITNESS WHEREOF, Commission and Tenant have executed this Lease as of the dates indicated below.

COMMISSION: METROPOLITAN AIRPORTS COMMISSION

Abstract Property

NO DELINQUENT TAXES AND TRANSFER ENTERED

DEC 20 1991

LOU McKENNA, DIRECTOR

Authorization No. P-2623

DEED NO. 56086

2629404

THE GRANTOR, MIDWESTERN RAILROAD PROPERTIES, INCORPORATED, a Delaware corporation, whose principal office is located at 165 N. Canal Street, Chicago, Illinois, for the consideration of THIRTY-EIGHT THOUSAND FIVE HUNDRED AND NO/100 DOLLARS ($38,500.00), conveys and quitclaims to STATE OF MINNESOTA, DEPARTMENT OF MILITARY AFFAIRS of St. Paul, Minnesota 55155, GRANTEE, all interest in the following described real estate situated in the County of Ramsey, and the State of Minnesota, to wit:

TRACT A:

That part of Government Lots 4 and 12 of Section 5, Township 28 North, Range 22 East, Ramsey County, Minnesota, being a strip of land 35 feet in width, which lies between two lines running parallel with and distant 15 feet and 50 feet Easterly of the main track center line of the Chicago, Rock Island and Pacific Railroad Company (formerly the St. Paul Terminal and Transfer Company) now Midwestern Railroad Properties, Incorporated, as said main track was originally located and established over and across said Section 5 and within a distance of 1,299.82 feet Southerly of the Easterly extension of the Southerly line of Government Lot 5 of said Section 5; excepting therefrom that part thereof contained within the following described tract: Commencing at the Southeast corner of said Government Lot 5; thence Easterly on the Southerly line of said Government Lot 5 produced, 71.44 feet; thence South 00 degrees 06 minutes 00 seconds East, 198.77 feet to the point of beginning of the tract to be described; thence North 00 degrees 06 minutes 00 seconds West, through said point on the Southerly line of said Government Lot 5 produced and on a line intersecting the Northerly line of St. Lawrence Street produced Northeasterly, distant 87.48 feet Northeasterly from the Southeasterly corner of Dunwell and Spencer's Addition to Brooklynd, 870.05 feet; thence Easterly on a line parallel to the Southerly line of said Government Lot 5 produced, 119 feet; thence South 00 degrees 39 minutes 00 seconds East on a line parallel to the Easterly line of said Government Lot 5, a distance of 979.63 feet; thence Northwesterly in a direct line, 167.63 feet to the point of beginning;

Deed tax hereon due $ 137.95

Excepting and Reserving, however, unto the Grantor, its lessees, licensees, successors and assigns, the right to continue to protect, maintain, operate, and use any and all existing drainage, driveways, conduits, sewers, water mains, gas lines, electric power lines, communication lines, wires and other utilities, and easements of any kind whatsoever on said premises, including the repair, reconstruction and replacement thereof.

By the acceptance of this conveyance, the Grantee, for itself and/or its heirs, successors, transferees and assigns, hereby agrees:

DEED NO. 86686

Authorization No. P-2623

(1) To assume the total expense of erecting and maintaining a bumper-high barricade and/or fence along the Westerly boundary line (trackside boundary) of the above described real estate, if Grantee relocates the existing roadway Westerly onto the above described real estate and all vehicle parking is confined to the area East of the relocated roadway, the fence or bumper-high barricade will not be required.

(2) Not to alter drainage conditions of the above described real estate in such a way as to adversely affect the remaining real estate of the Grantor.

(3) To take all steps necessary, at no expense to Grantor, to comply with any and all governmental requirements relating to land platting and use.

✓ Grantor certifies that there are no wells on the subject property.

Pursuant to Section 3.2 of Article III of the Mortgage, Deed of Trust, Assignment of Leases and Rents, Security Agreement and Financing Statement dated as of October 27, 1989, as modified, (the "Mortgage") and recorded in the Office of the Register of Deeds in and for Ramsey County as Document Number 2616777, the Grantor hereby certifies that (a) this deed and conveyance is made pursuant to the provisions of Section 3.2 of Article III of said Mortgage, (b) the provisions of said Section 3.2 of Article III have been complied with and (c) the property hereby conveyed may be conveyed free from the lien of said Mortgage and is hereby conveyed free from the lien of said Mortgage.

DATED this 20th day of June, 19 91.

PFCs in Minnesota's Ambient Environment:

2008 Progress Report

Minnesota Pollution Control Agency

Table of Contents

PFC Acronym Glossary

Groups

PFCs – perfluorochemicals or perfluorinated compounds
PASs – perfluoroalkyl surfactants
PFCAs – perfluorocarboxylic acid
PFSAs – polyfluorinated alkyl substances
FTOH – fluorotelomer alcohols
PFAAs – perfluoroalkyl acids

Individual

PFBA – perfluorobutanoic acid
PFBS – perfluorobutane sulfonate
PFPeA – perfluoropentanoic acid
PFHxA – perfluorohexanoic acid
PFHxS – perfluorohexane sulfonate
PFHpA – perfluoroheptanoic acid
PFOA – perfluorooctanoic acid
PFOS – perfluorooctane sulfonate
PFOSA – perfluorooctane sulfonamide
PFNA – perfluorononanoic acid
PFDA – perfluorodecanoic acid
PFUnA – perfluoroundecanoic acid
PFDoA – perfluorododecanoic acid
N-EtFOSE – N-ethyl perfluorooctanesulfonamidoethanol
N-MeFOSE – N-methyl perfluorooctanesulfonamidoethanol

Other Acronyms

AFFF – aqueous fire fighting foam
ECF – electrochemical fluorination
WWTP – wastewater treatment plant

Executive Summary

Perfluorochemicals (PFCs) are a group of fully-fluorinated carbon-based compounds that repel both oil and water and are very resistant to breakdown in the environment. These properties have led to their use in numerous industrial and consumer products. Specific PFCs of interest in Minnesota include PFOS (perfluorooctane sulfonate), PFOA (perfluorooctanoic acid) and PFBA (perfluorobutanoic acid).

Manufacture of PFCs in Minnesota began in the late 1950s by 3M Corporation at its Cottage Grove Facility. 3M ceased production of PFOS and PFOA in 2002 after several studies showed that PFCs were bioaccumulating in humans and wildlife worldwide. In 2004, PFCs were detected in drinking water supplies in several eastern Twin Cities suburbs; sources of the contamination were traced to legal disposal of 3M manufacturing wastes. The Minnesota Pollution Control Agency (MPCA) and the Minnesota Department of Health (MDH) have since identified contaminated wells and provided clean drinking water to affected consumers.

PFCs are released to the environment through manufacturing processes, industrial use, and the use of PFC-containing consumer products. PFCs, like PFOS and PFOA, are also formed from the breakdown of other fluorinated compounds such as fluorotelomer alcohols produced by DuPont. In order to identify potential sources of PFCs to the environment it is critical to understand the fate and transport processes governing these compounds.

It is now known that PFCs are ubiquitous environmental contaminants. This is a concern because some PFCs (such as PFOS and PFOA) are persistent, bioaccumulative and toxic. The worldwide presence of PFCs in humans and animals provides strong evidence that exposure to this group of chemicals is through general environmental exposure and is not limited to known point sources or areas of contamination. Although all routes of exposure have yet to be clearly defined, exposure likely occurs through a variety of pathways including drinking water, food and food packaging, and use of consumer products containing PFCs.

In Minnesota, it has been apparent since 2006 that PFCs may be present at concentrations of potential concern in the ambient environment (i.e., away from 3M disposal sites). The MPCA negotiated a Consent Order with 3M in May 2007. The Consent Order provided funding for additional monitoring of PFCs around Minnesota and intense remediation efforts at the 3M manufacturing and waste disposal sites. Since then, the MPCA has made a number of important discoveries regarding PFCs in Minnesota's ambient environment.

Some of the results to date presented in this report include the following findings. Several lakes in the Twin Cities and portions of the Mississippi River have elevated concentrations of PFOS in fish tissue, which has resulted in fish consumption advisories. Sampling indicates that, although present, PFC concentrations in shallow ambient ground water are well below health advisory concentrations. Most sampled waste water treatment plant influent, effluent, and sludge has detectable concentrations of PFCs. PFCs were detected in permitted landfills leachate, landfill gas, and landfill gas condensate, as well as in ground water upgradient and downgradient of the facility. More detail and additional results are presented in the report, including several extensive data sets in the appendices.

Introduction

Perfluorochemicals (PFCs) are a group of fully-fluorinated carbon-based compounds that repel both oil and water and are very resistant to breakdown in the environment. These properties have led to the use of PFCs in numerous industrial and consumer products. PFOS* (perfluorooctane sulfonate), PFOA (perfluorooctanoic acid), and PFBA (perfluorobutanoic acid) are examples of individual PFCs of concern in Minnesota. Common applications of PFCs include non-stick coatings for cookware, stain repellants, paper coatings, food packaging, fire-fighting foams, lubricants, wetting agents, corrosion inhibitors, cleaning products, cosmetics, and pesticide applications.

At this time, PFOS, PFOA, and PFBA are the PFCs of greatest interest in Minnesota due to their persistence, toxicity, and/or widespread detection in the environment and biota.

Manufacture of PFCs in Minnesota began in the late 1950's by 3M Corporation at its Cottage Grove Facility. After research found that PFOS could be measured in not just wildlife but also humans from around the world, 3M began the process of phasing out of the manufacture of the 8-carbon PFCs (PFOS and PFOA) and PFOS-related products in 2000. The phase out of PFOS production in Minnesota was completed in 2002. Since that time, 3M has worked to develop new technologies based on shorter chain PFCs such as perfluorobutane sulfonate (PFBS).

Although PFCs have been in commercial use for nearly 50 years they have only recently been detected in the global environment. It is now known that PFCs are ubiquitous environmental contaminants; they have been detected globally in lakes, rivers, oceans, sediment, soil, precipitation, air, biota, sewage sludge, and wastewater effluent. This is a concern because some PFCs are persistent, bioaccumulative and toxic. Several studies indicate that most wildlife and humans worldwide have at least some PFCs in their blood. While many sources of PFC exposure remain unknown, it is likely that exposure to PFCs occurs through consumption of contaminated food and water, and the use of numerous PFC-containing commercial products.

In 2004, PFCs detected in drinking water supplies in several eastern Twin Cities suburbs were traced to legal disposal of 3M manufacturing wastes, which occurred in the 1950s and later at four different locations. The Minnesota Pollution Control Agency (MPCA) and the Minnesota Department of Health (MDH) have since identified contaminated wells and provided clean drinking water to affected consumers. Most of the drinking-water problems have been characterized and brought under control. However, PFCs have been detected in all other environmental settings tested to date in Minnesota.

*Please refer to the acronym glossary at the beginning of this document for a complete list of acronyms used.

The May 2007 Consent Order with 3M paid for additional monitoring of PFCs around Minnesota as well as intense remediation efforts at the 3M manufacturing and waste disposal sites. From this work, the MPCA has learned that:

- The use of PFCs in industrial, commercial and consumer product applications continues even though 3M ceased production of PFOA and PFOS in 2002. Manufacturers in other countries continue to produce PFOA and PFOS for use in products that are legally exported and used for beneficial purposes in the U.S. and around the globe.

- Past and present PFC usage provides pathways for release into the environment that cannot be solely attributed to 3M, which developed the original PFC chemistry.

The MPCA is therefore pursuing a broader approach to addressing PFCs effectively, both in the short and long term:

Consent Order with 3M

In 2007, the MPCA negotiated a Consent Order (legally binding agreement) with 3M on the PFC contamination in Minnesota. The issues addressed in the Consent Order are as follows:

- Rigorous, robust cleanup plan
- Recognition of MPCA jurisdiction
- Municipal and private drinking water supplies
- Future actions on PFBA
- Additional studies on health and environmental effects
- Cooperation from 3M on sharing research and information
- Preservation of MPCA's right to take action in the future

- Investigations – ongoing studies to understand the presence, extent, sources, movement and fate of PFCs in the environment
- Remediation– vigorous and effective completion of cleanups at the 3M PFC waste disposal areas in Woodbury, Oakdale, Cottage Grove, and the Washington County Landfill
- Regulation – monitoring at wastewater treatment plants (WWTPs) and operating solid waste facilities; establishment of water quality criteria (site-specific standards) to protect fish for human consumption; permit requirements for facilities discharging into impaired waters
- Partnerships – with MDH, Minnesota Department of Natural Resources (MDNR), United States Environmental Protection Agency (EPA) and others to better characterize the risks of exposure to PFCs in the environment
- Data Management – efficient tracking, storage, retrieval and usage of all data including environmental samples; remedial investigations
- Communications – regular meetings with affected local officials and legislators; extensive web pages detailing agency actions and findings

The MPCA's investigation of PFCs in the ambient environment, along with supporting information gleaned from the scientific literature, is presented in this interim report. Several studies are still in progress, and more studies will likely be proposed in the future.

Investigation of PFCs in the Ambient Environment

A number of PFC projects have been completed or are underway. Brief descriptions of projects underway or completed by the MPCA and its partners are provided below, alphabetically.

Air and Precipitation Monitoring

Ambient air and precipitation samples are being collected to screen for PFC concentrations in urban and rural environments.

Aqueous Film-Forming Foam (AFFF) Use

Two AFFF projects are underway. One is a survey of PFC-containing AFFF users in Minnesota regarding their use of AFFF in fire fighting training. The other is a case study of PFC concentrations in sediment and shallow ground water at a site of known AFFF discharge during fire fighting training.

Fish Tissue and Surface Water Monitoring

Fish tissue and surface water samples are being collected in selected urban and rural lakes for two purposes. The first is to better understand the extent and magnitude of PFC contamination in commonly harvested fish species in lakes and rivers with high fishing pressure. Second, results will be used to evaluate bioaccumulation of PFCs in fish fillet tissue.

Food Web Studies

Two studies are underway at Lake Johanna to help develop better understanding about how PFCs move through the aquatic food web. Water, sediment, and aquatic organisms from Lake Johanna are being analyzed for PFC content as part of an aquatic food web study. Additionally, swallow eggs, chicks, and their food insects are being analyzed to determine differences in PFC concentrations in different locations and environmental media, identify which PFCs contribute to the differences, and to calculate accumulation rates.

Ground Water Monitoring

Samples of ground water were collected from wells in vulnerable, shallow aquifers in urban and agricultural areas. Sample results provided information about PFC impacts to ground water from potentially many different sources: industrial and municipal stormwater infiltration, land use, precipitation infiltration, surface water infiltration, pesticides, land application of biosolids, and/or atmospheric deposition.

Lake Calhoun PFOS Source Investigation

Elevated concentrations of PFOS in fish tissue from Lake Calhoun were a surprise. Storm water and rain water samples from the Lake Calhoun storm watershed will be collected to identify major sources of PFCs to Lake Calhoun, if major sources exist. This study is still in progress.

Land Use Influence of PFOS Concentrations in Fish Tissue

This project will utilize GIS, statistical analysis, and other information to analyze watershed characteristics and other factors that may influence PFOS concentrations in fish tissue.

Literature Reviews

On an ongoing basis, science indices, journals, reports, and regulatory news about PFC research results or policy development are searched. Review of the current literature keeps the MPCA and MDH up-to-date on research being conducted worldwide on PFC fate and transport, toxicology, risk assessment, and standard setting.

Mississippi River Sampling

The EPA is coordinating an effort to evaluate the range of concentrations of PFCs in water of the Mississippi River from the headwaters in Minnesota to the confluence with the Ohio River in Cairo, Illinois. In conjunction with the Water Quality Task Force members of the Upper Mississippi River Basin Association, approximately 200 surface water samples are being collected from key locations in the Mississippi River between Lake Itasca, Minnesota, and Cairo, Illinois.

Soil Microcosm Studies with EPA Labs

In cooperation with EPA, soil microcosms are being used to evaluate the potential for particular PFC compounds to break down in ground water and to measure the adsorption characteristics and mobility of PFCs in the ground water environment. Microcosms have been constructed using aquifer sediment spiked with PFC compounds. Periodic analysis of the microcosms will provide data on PFC fate and transport in ground water.

Urban Watershed Study

Stormwater inputs to PFC-impaired lakes will be sampled to develop better understanding about how PFCs move through an urban watershed to a lake.

Wastewater Treatment Plant PFC Release Assessment

Influent, effluent and sludge from WWTPs were sampled to assess the contribution of these facilities as potential sources of PFCs in Minnesota's environment. Facilities were selected to represent a variety of treatment technologies and influent sources (i.e. residential, commercial, industrial). Sources, environmental fate, and potential exposure pathways of PFCs detected at wastewater treatment facilities will be evaluated.

Water Quality Criteria Development

Water quality criteria were developed for PFOS and PFOA; PFBA is still in process. The process involves literature reviews of toxicity data, including 3M aquatic toxicity tests. Site-specific criteria are in place for PFOS and PFOA in Lake Calhoun and the Mississippi River. In Lake Calhoun, the chronic criteria (protective of both human health and aquatic life) are 12 ng/L for PFOS and 1.62 µg/L for PFOA. In the Mississippi River, the chronic criteria are 6 ng/L for PFOS and 2.7 µg/L for PFOA. Go to http://www.pca.state.mn.us/cleanup/pfc/index.html#pfos for more information.

Wildlife/Ecological Risk Assessment

To assess ecological risks from PFCs, MPCA filled a gap in National Park Service sampling, and expanded the study area for assessing targeted "persistent, bioaccumulative, toxicants" (PBTs), including PFCs, in bald eagles that nest along portions of the Mississippi and St. Croix Rivers. The sampling will allow monitoring of trends in PFC concentration and bald eagle nesting success over

time. The number and development of young in nests are assessed in the study area, and eagle nestling blood samples were collected for analysis of PFCs.

The purpose of these studies is to determine the distribution and extent of PFC contamination in Minnesota's ambient environment. However, these studies can only assess concentrations of PFCs in various media. In order to give context and meaning to the data, it is critical to first understand the fate and transport of PFCs in the environment. The following section provides a brief discussion of direct and indirect sources of PFCs, as well as fate and transport in relevant environmental media.

Sources, Fate and Transport of PFCs in the Ambient Environment*

*Please refer to Appendix B for a more detailed discussion of the fate and transport of PFCs.

The variety and number of fluorinated compounds currently in production comprise an enormous number of chemicals. Drugs, anesthetics, chemotherapeutic agents, pesticides, refrigerants, such as chlorofluorocarbons (CFCs), as well polymers such as Teflon and Goretex, are a few of the thousands of products made from fluorinated carbon compounds [2].

***Perfluorinated compound** – a compound in which all available carbon atoms are bound to fluorine atoms.*

PFOA and PFOS are examples of perfluorinated surfactants. They are often found in surface water samples and are almost always found in wildlife and humans. While it is clear that these are not naturally occurring compounds – they are entirely human-made – how these compounds have become so widely distributed in our environment in often very remote locations is less understood. Studies have shown that PFOA, for example, is likely "ubiquitous in the northern hemisphere" [3].

The direct release of these compounds to the environment through manufacturing processes represents one way chemicals like PFOA or PFOS get into the environment. However, several recent studies show that PFOA and PFOS can be generated as byproducts when other fluorinated compounds break down. This means that the fate of other fluorinated compounds is important to understanding how chemicals like PFOA and PFOS are released to and persist in the environment.

Perfluorinated surfactants are made either through *electrochemical fluorination* (ECF) or through a *telomerization* manufacturing process [2, 4]. ECF is the process that 3M used to produce fluorinated compounds. ECF was used to produce the fluorinated surfactants PFOA and PFOS that are used in fire-fighting foams (AFFF), paints, polishes, films, and lubricants. ECF is the only process used to directly produce PFOA and PFOS, with over 6 million pounds produced in 2000 [4]. The major contributors to environmental loads appear to be through the use of PFOA and perfluorononanoic acid (PFNA) [5]. Other chemicals produced through ECF include the compounds used to make fabric stain repellents, carpet treatments, and paper coating materials [2, 4].

DuPont uses the telomerization process to make fluorinated compounds [2]. Unlike the PFCs made through 3M's ECF process, Dupont's method is often used to make *fluorotelomer alcohols* (FTOHs)[2]. FTOHs are not used directly in products. Instead, FTOHs are used as intermediates in the manufacture of other products, where they are often present in residual amounts of up to 4% by weight [6]. There are many types of fluorinated compounds that are used in a wide variety of products.

Chemicals like PFOA and PFOS are resistant to degradation which makes them persistent in the surface water, soil, and ground water. Moody *et al.* [7] studied a creek into which fire-fighting foam (AFFF) was spilled. PFOA, perfluorohexanoic acid (PFHxA, a chemical similar to PFOA), and PFOS were present in the surface water and in fish tissue for several years after the spill. They were also detected in ground water underneath a site where AFFF fire-fighting foam was used [8]. These studies focused on surface water or ground water contamination where there was a clear source or a spill. The widespread, low-level contamination of soil, ground water, and surface water in remote locations is difficult to explain, however, because it is unlikely that PFOA and similar chemicals that are non-volatile could be transported to areas far from a likely source.

Unlike PFOA, the FTOHs produced by DuPont are volatile and can be found in the air. FTOH will break down into PFOA (Fig. 1) and related chemicals in the atmosphere [3, 9] such as perfluorodecanoic acid (PFDA, a compound similar to PFOA). With over 10 million pounds of FTOH produced per year, enough FTOH is manufactured yearly to maintain the current observed concentrations of PFOA and related compounds in the environment [9]. FTOHs also break down in wastewater treatment plants, where up to 10% of FTOH can be converted to PFOA and similar compounds [10, 11].

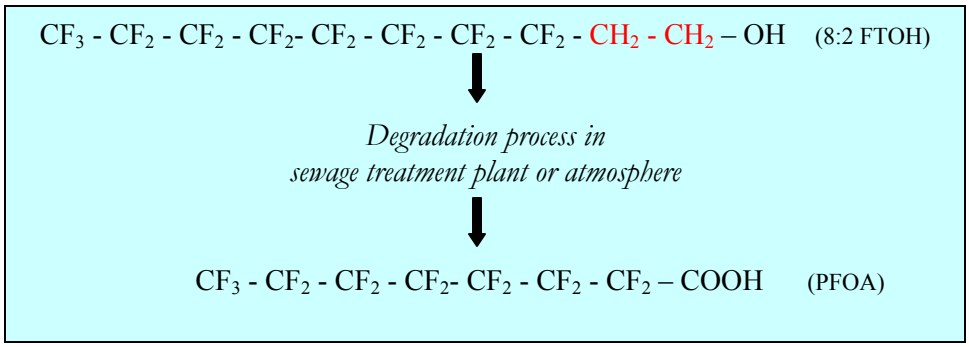

Figure 1. Conversion of 8:2 fluorotelomer alcohol into PFOA.

The degradation of FTOHs to PFOA and related chemicals can explain other observations:

- The appearance of PFDA in fish samples in Minnesota is consistent with the breakdown of FTOH to PFDA, because PFDA has no significant history of intentional industrial production [12].
- According to DeSilva and Mabury (2006), 89% of PFOA in human blood samples from the Midwest is attributable to PFOA that originated from telomerization production methods [12].
- Recent MPCA studies show that various perfluorinated surfactants – including PFOA and PFOS – were present in air samples in 2008 [13]. The presence of these compounds in the air can be partially explained by the breakdown of FTOH molecules in the atmosphere. 3M discontinued manufacture of these PFCs in 2002.
- Minnesota ground water monitoring shows PFOA, perfluoropentanoic acid (PFPeA), perfluorohexanoic acid (PFHxA), perfluoroheptanoic acid (PFHpA), and perfluorononoic acid (PFNA) at trace or low concentrations that are widespread under ambient conditions, with no known or likely sources of these compounds [14]. The degradation of FTOH

compounds in the air or in the soil is a plausible source of these detections in the ambient environment.

Polymers made from fluorinated chemicals are produced in far greater volumes than the fluorinated surfactants discussed above. Very little information, however, has been published regarding their fate in the environment [4].

Polymers typically resist breaking down. The breakdown of polymers made from fluorinated chemicals is expected to add only a very slight amount of PFOA and similar chemicals to the environment [15]. However, the polymers used widely for oil and water-resistant coatings on food-contact paper products have been found to degrade into FTOH and subsequently to PFOA [16]. The degradation of this water-resistant coating chemical was found to occur in the intestinal tract and the blood of laboratory animals, representing a significant source of exposure to PFCs [16].

Indoor air concentrations of fluorinated chemicals used to make fabric and carpet coatings are roughly 10-20 times greater than outdoor concentrations of the same chemicals [17]. These compounds may, in turn, break down into PFOS [18]. This could expose people to PFOS through ingestion and inhalation inside of homes that contain fabric coating products.

In soil, PFOS has been found to adsorb to various minerals, with adsorption increasing with PFOS concentration[19]. However, PFOS apparently adsorbs to soil less than other pollutants [19]. Some research shows that the mobility of PFOS and PFOA in ground water can change depending on the ground water conditions [20]. Adsorption variability might be important in how far and how fast these contaminants spread in aquifers away from spills or disposal sites.

Distribution of PFCs in Minnesota's Environment

In Minnesota, it has been apparent since 2006 that PFCs may be present at concentrations of potential concern beyond the disposal sites and the groundwater contamination associated with them. Since then, the MPCA has made a number of important discoveries regarding PFCs in Minnesota's ambient environment. The following section provides a brief discussion of the results to date of several completed and on-going studies at the MPCA. For more detailed analytical results, please refer to Appendix A.

Twin Cities Metro Area Lakes - Fish and Water

In April 2007, the MPCA found elevated concentrations of PFOS in fish taken from Lake Calhoun in Minneapolis. PFOS is the most bioaccumulative PFC in fish, and this finding was of concern to the city of Minneapolis and people who fish in this popular lake. MDH issued new fish consumption advisories for the lake. Sampling was expanded to other metro-area fishing lakes, and additional findings were announced later in 2007 and early 2008. In addition to Calhoun, Lake Johanna and Lake Elmo received one meal per month fish-consumption advisories. For the most part these lakes have no groundwater connection with the waste sites, and the source(s) of contamination are still not identified [21]. Figure 2 illustrates the 2006-2008 Twin Cities metro area fish sampling results. MPCA has ongoing projects underway, including an aquatic food web study and a stormwater runoff study, to better understand the distribution of PFCs in Minnesota's aquatic environment.

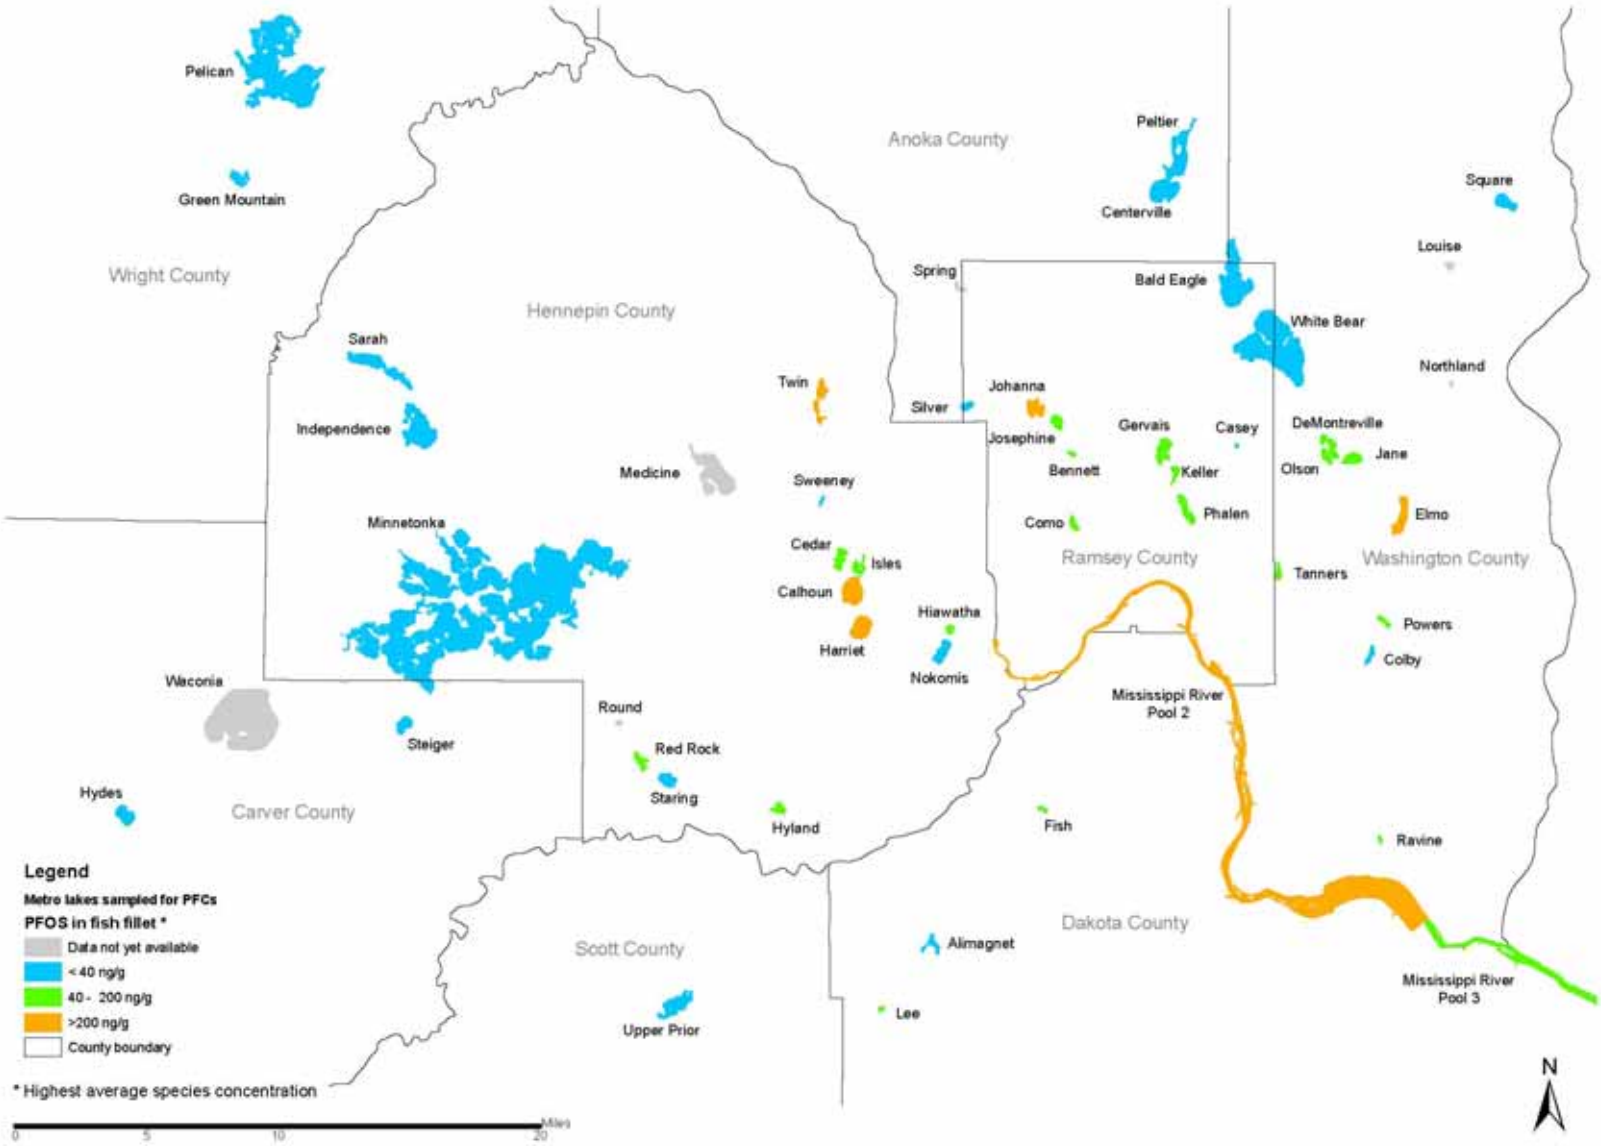

Figure 2. Fish Tissue Sampling Results for Twin Cities' Area Lakes (2006 – 2008).

Mississippi River Sampling

Fish have been collected from various reaches of the Mississippi River and analyzed for PFCs since 2005. Elevated concentrations of PFOS in fish tissue have resulted in MDH fish consumption advisories for at least one species in Pool 2, Pool 3, Pool 4, and Pools 5, 5a, and 6 (Fig. 2). Fish were sampled in the Mississippi River near Brainerd, and the PFOS concentrations in the Brainerd-area fish were low.

Ground Water

Ambient shallow ground water was sampled for PFCs in urban and agricultural areas of Minnesota during 2006 and 2007. Sampling was conducted by MPCA in cooperation with the Minnesota Department of Agriculture (MDA). Wells were selected in vulnerable aquifers. PFCs were detected in ambient shallow ground water at concentrations below MDH health guidelines. PFBA was the most commonly detected PFC, and it was the PFC detected at the highest concentration. Most of the PFC detections above the reporting limit were in the Twin Cities Metro Area. Land uses associated with the wells that had detected PFC concentrations were Industrial, Commercial, Sewered Residential, and Agricultural [22].

Air Monitoring

Air samples have been collected at two Minnesota sites, one urban and one rural. PFOS, PFOA, and PFBA were detected in air at both locations. Total concentrations were approximately 50% higher in the urban location. Additionally, 7 PFCs not detected in the rural location were detected at the urban location. Very few studies have measured and reported air concentrations of PFOS and PFOA. Minnesota's air results are within the range of PFOS and PFOA concentrations in air reported by others [23, 24]. A suburban location is currently being monitored for PFCs in air, but results are not yet available.

AFFF Fire-Fighting Foam

In 2008, MPCA hired a contractor to survey likely users of PFC-containing fire-fighting foam regarding their use of foam in both fire suppression training and in fire fighting. Survey questions were related to frequency of foam use, volume of foam used, location of foam used, and brands/types of foam used. Approximately 67% of municipal fire departments (522 of 785), all 16 fire training school, all three airports with fire departments, and both refineries with fire departments responded to the survey. Identified fire training locations were screened and ranked for relative risk based on type of foam used and proximity to potential human or environmental receptors: drinking water wells, well head protection areas and source water protection areas, surface water, wetlands, and karst geology.

Approximately 20 current or former fire training areas were identified as having a high potential for PFC contamination to drinking water, ground water, soil, and/or surface water. MDH and MPCA are conducting follow-up sampling and investigations of high-risk sites. The first round of sampling will focus on drinking water wells in proximity to fire training activities.

Wastewater Treatment Plants

The MPCA conducted a survey for PFCs in wastewater effluent at 28 municipal and industrial WWTPs across the state in 2007. A number of sample locations showed low concentrations of PFCs. The city of Brainerd's plant had elevated concentrations (see box). The Brainerd finding, traced to a chrome-plating facility, raised questions about the potential for PFCs to enter surface waters through permitted WWTP discharges to surface water. More facilities were sampled in 2008, and results were consistent with 2007 findings [21].

Permitted Landfills

Through monitoring conducted in 2006-7, the MPCA found PFCs in ground water, leachate, landfill gas, and gas condensate at a number of landfills. These findings suggest that PFCs may be released from consumer, commercial and demolition wastes. However, the concentrations were very low in ground water, and in most cases, results suggested that landfills were not acting as sources of PFC impacts to ground water. No drinking-water wells were affected [21].

Soil Microcosms

In collaboration with EPA's National Exposure Research Laboratory, MPCA is investigating the fate of PFCs in ground water. Soil collected from beneath the ground water table at the Washington County Landfill was brought to the laboratory.

Microcosms were prepared using this soil under anaerobic conditions, and PFOS and PFOA were added to the microcosms at known concentrations. Samples of these microcosms on a quarterly basis showed that, while these compounds resist degradation, the adsorption of these compounds to the soil changes with time. This is possibly due to changing oxidation/reduction conditions within the microcosms. These results have important implications to the fate of PFC in the vicinity of landfills where oxidation/reduction status changes spatially.

Brainerd WWTP Case Study

The PFOS concentrations in the Brainerd wastewater treatment plant influent, effluent and sludge were significantly higher than other WWTPs sampled around the state. In response to the noteworthy result, Brainerd Public Utilities (BPU), operator of the WWTP, hired a consultant to collect wastewater samples from locations around the city to try to determine the source of the PFOS. PFOS was detected in samples from five locations. Four concentrations ranged from 0.08 - 1.18 μg/L. The fifth sample concentration, collected at a manhole in an industrial park, had a PFOS concentration of 49.8 μg/L. [1].

Keystone Automotive, a chrome plating operation specializing in automobile bumpers, is located in the industrial park adjacent to the manhole with the highest PFOS concentration sample. Keystone used a PFOS-containing surfactant product in its chrome plating bath. The PFOS-containing surfactant product reduces surface tension, which in turn helps reduce emissions of hexavalent chromium from the plating solution – an important worker-safety issue. In September 2007, Keystone switched to a different mist suppressant that does not contain PFCs. Ongoing monitoring is being conducted to monitor the effectiveness of the new mist suppressant. Monitoring will continue to document the effect that the product change has over time on PFOS discharge concentrations [1].

PFCs in Humans and Wildlife: Exposure and Effects

That PFCs are found throughout the world is not surprising due to their presence in a wide variety of industrial, commercial, and consumer products. The world-wide presence of PFCs in humans and animals provides strong evidence that exposure to this group of chemicals is through general environmental exposure and is not limited to known point sources or areas of contamination. The exact sources and routes of all exposures are unknown, although efforts are underway to evaluate the primary sources.

Several studies of human blood samples from around the world have found that nearly all people tested have some PFCs in their blood [25, 26]. A number of studies have also tried to assess potential routes of exposure [27-30]. Although all routes of exposure have yet to be clearly defined, exposure likely occurs through a variety of pathways, including drinking water, food and food packaging, and use of consumer products containing PFCs. Once people are exposed to PFCs, they are very slowly eliminated and stay in the body for many years [31].

PFCs have also been shown to bioaccumulate in wildlife, including top predators such as polar bears, bald eagles, mink, and seals; PFCs also bioaccumulate in fish. However, unlike other persistent organic pollutants, PFCs bind to protein rather than fatty tissues making it difficult to predict tissue concentrations using typical bioaccumulation models.

Human Exposure via Drinking Water

As a result of the manufacturing activities in Minnesota and the accompanying waste disposal, some eastern Twin Cities suburbs were found to have higher concentrations of PFCs in ground water when compared to the general environment. Several studies suggest that PFCs readily move through the soil and enter the ground water. Through investigations conducted by MDH and MPCA, it was discovered that some area residents were being exposed to PFCs through their drinking water (Table 1). Over 1,300 wells in the eastern Twin Cities suburbs have been tested, and MDH, MPCA, and 3M have worked with affected parties to provide safe drinking water by supplying alternative sources of water or assisting with water filtration to remove PFCs.

Testing of ground water in the eastern Twin Cities suburbs over the past several years suggests concentrations of PFCs have remained stable and have not increased. MDH and MPCA staff continues to test wells in the area to monitor any changes in concentrations or movement of the PFC ground water plume.

To date, most of the drinking water supplies located away from the eastern Twin Cities suburbs that have been tested have no detectable PFCs. Although PFBA was detected in several wells, the concentrations found were below levels of health concern established by the MDH. Testing of additional drinking water sources throughout Minnesota will continue to evaluate potential exposure to PFCs through drinking water.

Table 1. PFCs detected in Minnesota Drinking Water

	PFOS[a]	PFOA[a]	PFBA[a]
East Metro Area			
Municipal wells	ND[b] – 0.9	ND – 0.9	ND – 2.2
Private wells	ND - 3.5	ND - 2.2	ND - 12
Other Areas			
Municipal wells	ND	ND	ND – 0.4
Private wells	ND	ND	ND - 0.5
Criteria set by MDH			
Health Risk Limit (HRL)	0.3	0.5[c]	-
Health Based Value (HBV)	-	-	7

[a]Concentrations are in µg/L (ppb, parts per billion)
[b]ND = not detected
[c]In September 2008, MDH proposed lowering the HRL for PFOA to 0.3 µg/L.

Human Exposure via Fish Consumption

There are numerous reports documenting the presence of PFCs in fish and animals throughout the world [32-36]. In cooperation with the DNR and MDH, the MPCA has been testing fish in Twin Cities metro area lakes and rivers as well as selected outstate water bodies for the presence of PFCs to evaluate the potential for human exposure through the consumption of fish.

Fish from 56 different lakes as well as several reaches of the Mississippi and St. Croix Rivers have been tested for PFCs. PFOS, the primary PFC found to accumulate in fish fillet tissue, has been found in various fish species from several different lakes and river reaches at concentrations such that the MDH has issued site specific consumption guidelines for fish for the affected waters. Other PFCs detected in Minnesota fish include PFPeA, PFHxA, PFHxS, PFOSA, PFNA, PFDA, and PFUnA (Appendix A).

Human Health Risk

Although there are only a few studies investigating the effects of PFCs on human health, it is an area of active scientific research. The majority of studies evaluating the human health effects of PFCs have been conducted using animal models. While most studies have focused on PFOS and PFOA, information is growing for other PFCs such as PFBA and PFHxS.

In studies evaluating the health of 3M workers exposed to PFCs during manufacturing processes, no clear associations between adverse health effects and exposure were found [37]. It should be noted that the people evaluated in these studies were healthy workers who may not represent the average population. Three recent studies evaluated the health effects of PFCs on newborn babies associated with concentrations of PFCs in the blood of their mothers [38-40]. Each study found PFC concentrations in the mother's blood correlated to decreases in measures of growth in the newborns. Participants in these studies were exposed to PFCs through typical life activities, not as a result of known point sources of contamination.

As part of an agreement in a class action lawsuit against DuPont, a health study (The C8 Health Project) of 70,000 people in West Virginia and Ohio exposed to PFOA in drinking water is being undertaken to determine if there are any health effects related to PFOA exposure. Participants in this project live in areas of known drinking water contamination due to industrial activities.

Preliminary reports suggest a relationship between PFOA exposure and elevated cholesterol levels. Additional reports are pending [41].

In animal studies, PFCs have been associated with adverse effects including, but not limited to, altered cholesterol and thyroid hormone levels, suppression of the immune system, and developmental effects such as increased neonatal mortality, decreased body weight and weight gain in newborns and delayed eye opening. Animal studies generally form the basis of establishing human health criteria.

Human Health Criteria

Minnesota Department of Health

Following the discovery of PFCs in ground water in the East Metro Area, the MDH developed drinking water criteria for PFOS, PFOA and PFBA. Under emergency rule making authority enacted by the Minnesota Legislature, the MDH promulgated in rule Health Risk Limits (HRLs) of 0.3 µg/L* for PFOS and 0.5 µg/L for PFOA in August 2007. In September 2008, MDH proposed lowering the HRL for PFOA from 0.5 µg/L to 0.3 µg/L. In February 2008, MDH established a health based value (HBV) of 7 µg/L for PFBA. PFBA is thought to be less toxic than PFOS and PFOA because of its shorter half-life in rodents. HRLs and HBVs are concentrations of chemical-specific ground water contaminants that MDH has determined would result in little or no appreciable harm to people drinking the water daily over a lifetime. The process of determining HRLs and HBVs are the same; however, HBVs have not been promulgated in rule.

Due to limited toxicity information available for other PFCs, such as PFBS, PFHxS, and PFHxA, which have been found at very low concentrations in some wells, drinking water criteria cannot be developed for these chemicals at this time. The MDH continues to monitor PFC research activities and will re-evaluate criteria as new information becomes available.

In addition to the health criteria for PFOA, PFOS and PFBA established by the MDH for drinking water, values for the protection of human health have also been developed by other regulatory and health agencies in the U.S as well as in Europe. As described below, drinking water values developed by other agencies range from 0.04 - 9 µg/L for PFOA and 0.1 - 0.9 µg/L for PFOS.

New Jersey

In 2007, the New Jersey Department of Environmental Protection (NJDEP) provided preliminary guidance to the Pennsgrove Water Supply Company to assess public health implications due to PFOA in the system's drinking water [42]. The NJDEP recommended a preliminary health-based guidance in drinking water of 0.04 µg/L PFOA, which is the lower end of the range of several values derived from non-cancer and cancer endpoints in different species.

The drinking water value the NJDEP developed is based on comparisons between target blood levels of humans and actual or predicted blood levels of experimental animals. The difference between the New Jersey and the Minnesota values for PFOA is primarily due to use of a larger uncertainty factor and different water intake rates.

MDH had several concerns regarding the New Jersey approach, including the ability to accurately estimate a serum concentration associated with observed effects, the potential for episodic serum

*µg/L (micrograms per liter) = ppb (parts per billion)

concentrations given the short half-life of PFOA in the female rat, and the uncertainty regarding the serum to water ratio. In developing its HBVs for PFOA and PFOS, MDH has chosen to utilize an animal model that it believes is more relevant to humans and a more traditional risk assessment methodology.

EPA

In 2006, the EPA set a site-specific drinking water action level of 0.5 μg/L for PFOA for the communities surrounding the DuPont Washington Works Facility in West Virginia [43]. Based on the scientific information available regarding the toxicity and the toxicokinetics of PFOA, EPA recommends that steps be taken to eliminate or reduce exposure to PFOA in the vicinity of the Washington Works Facility. Through a Consent Order, the EPA determined, "As required by Section 1431 of the SDWA (Safe Drinking Water Act) and for purposes of this Order, EPA has determined that C-8 [PFOA and its salts] is a contaminant present in or likely to enter a PWA [public water system] or a USDW [under ground source of drinking water] which may present an imminent and substantial endangerment to human health at concentrations at or above 0.50 μg/L in drinking water"[44]. In 2009, the EPA established provisional health advisories for PFOS and PFOA of 0.2 μg/L and 0.4 μg/L, respectively.

North Carolina

In 2007, the North Carolina Division of Water Quality in the Department of Environment and Natural Resources established a Public Health Goal of 0.63 μg/L for PFOA [45, 46] based on the same studies used by MDH. The difference between the North Carolina and the Minnesota values for PFOA is primarily due to use of a different water intake rate.

United Kingdom

The Food Standards Agency issued Tolerable Daily Intakes (TDIs) that are equivalent to drinking water concentrations of 9 μg/L for PFOA and 0.9 μg/L for PFOS. The evaluation conducted by the Food Standards Agency was based on the same experimental studies used by MDH; however, a dose-metric (a measurable physical/chemical property that corresponds to a compound's ability to cause a biological effect, such as toxicity) adjustment to account for species differences in half-life was not included [47-49].

Germany

In 2006, the German Ministry of Health established maximum tolerable concentrations for combined total exposure to PFOA and PFOS in drinking water and recommended that concentrations of PFOA and PFOS be combined in evaluations as they are considered to have comparable toxicity[50]. The Ministry issued a "strictly health-based guide value" for combined total exposure to PFOA and PFOS in drinking water of 0.3 μg/L. As a "health-based precautionary value", the Ministry established a drinking water value of 0.1 μg/L to account for exposure to other perfluorinated chemicals in addition to PFOA and PFOS due to the possibility of toxic risks which have yet to be identified and which may be attributed to additional perfluorinated chemicals with shorter or longer carbon chains than PFOA and PFOS. The Ministry recommends that efforts are to be made to reduce levels of total perfluorinated chemicals to less than the health-based precautionary value.

Ecotoxicity of PFCs

Several laboratory studies have demonstrated the toxicity of PFOS to aquatic organisms such as algae, invertebrates, fish, and ducks; PFOS toxicity in bobwhite quail has also been determined[51]. Mysid shrimp and chironomids, aquatic invertebrates that are important components in fresh water food webs, appear to be the most sensitive aquatic organisms tested to date. PFOS exhibits moderately acute toxicity in fathead minnows (*Pimephales promelas*). See Appendix C for a more detailed description of the available toxicity data.

A recent study of the effects of PFCs on marine mussels indicated that some PFCs (PFOA, PFNA, PFDA, and PFHxS) act as *chemosensitizers* (compounds that increase sensitivity to other chemicals) by interfering with a cell's ability to rid itself of toxic chemicals [52]. This interference could allow toxic substances that would normally be excreted to accumulate in the cell where they may have an adverse effect. Humans and other animals have cellular defense mechanisms similar to marine mussels.

PFCs as Potential Endocrine Disruptors

Several studies have shown that various PFCs have the potential to disrupt the endocrine systems of animals [53-59]. Laboratory studies of rats indicate that exposure to PFDA interfered with cholesterol transport and the production of steroid hormones, which resulted in reduced serum testosterone [56]. Exposure of rodents to PFOA has been associated with adverse effects on the testes [54]. PFOS has been shown to disrupt circulating levels of thyroid hormones in rats [57]. In cell cultures, FTOHs increased the number of estrogen receptors and induced MCF-7 breast cancer cell proliferation [55]. FTOHs were shown to be estrogenic *in vivo* in the male medaka (*Oryzias latipes*) as indicated by the induction of vitellogenin (a protein typically produced only in females) [58]. PFOS, PFOA, and certain FTOHs were also shown to be estrogenic *in vitro* [59].

Summary and Outlook

PFCs have a number of beneficial uses in myriad industrial, commercial, and consumer products due to their unique ability to repel both water and oil, and to resist breakdown. However, these same properties also contribute to their persistence, toxicity, ability to travel long distances to remote areas, and propensity to bioaccumulate in animals and humans. It is now known that PFCs are ubiquitous environmental contaminants that have been detected in a variety of settings, including humans and biota, worldwide.

There are many potential sources of PFC release to the environment, and humans and wildlife are exposed to PFCs through a variety of pathways. Several effects of exposure to PFCs have been documented in laboratory studies, including decreased growth and altered development in newborns, immune suppression, endocrine disruption, and increased sensitivity to other chemicals. Drinking water criteria and fish consumption advisories have been established to protect human health in Minnesota.

MPCA has conducted a number of studies of PFCs in the ambient environment, and several studies are still in progress. The goal of these studies is to determine the extent and distribution of PFC contamination in MN, and to determine likely sources of contamination. To date, PFCs have been detected in variety of environmental settings in Minnesota including surface water, ground water, air, soil, and fish.

The current PFC investigations are providing important clues to the origins, fate and consequences of PFCs in Minnesota's ambient environment, and will guide follow-up studies in the coming year. There is still much to learn, however. What do detections in fish, water, blood and other settings mean to people and the environment? How do PFCs move to remote parts of the planet? What are the ongoing sources of PFC release to the environment?

Despite having few human health studies, enough concerns are raised from existing human- and animal-based PFC toxicity studies to suggest that further environmental monitoring and health risk assessments are appropriate and necessary to answer questions of human and ecological risk. There are few established benchmarks against which to compare concentrations found in sampling work. Fortunately, the MPCA and MDH are not alone researching these challenging questions.

As is fitting for a global problem, scientists in government, academia and industry around the world are regularly adding to the scientific knowledge about environmental fate, movement, degradation, exposure and risks to humans and animals. The EPA is also becoming more active in the analytical and regulatory aspects of PFCs.

Minnesota agencies are in frequent contact with researchers worldwide and are partnering in some projects to represent Minnesota's interests. These complementary efforts at the state, national and international levels are key to solving the complex scientific questions about PFCs, and providing reliable information that citizens, government and industry are counting on to make good decisions.

All units are nanograms per liter (parts per trillion)
PFDA, PFUnA, PFDoA, and PFOSA were also analyzed, but were not detected in any sample
< indicates less than the detection limit. Number following the symbol represents the detection limit
Grayed detected values indicate that the detected concentration is below the Reporting Level of 25 ng/L
QA/QC of these results are in-process

[a] November 2006 samples were collected using a minimum purge protocol; Other samples were collected using a standard purge protocol

River Reaches

	Average PFOS Concentration [ng/g; ppb]								
	Bluegill	**Bluegill (comp)**	**Smallmouth Bass**	**Largemouth Bass**	**White Bass**	**Walleye**	**Northern Pike**	**White Sucker**	**Channel Catfish**
Mississippi River									
Brainerd area	10 (2)	ns	13 (5)	ns	ns	9 (5)	7 (3)	ns	ns
St. Croix River									
Washington County Bluff Park area	23 (5)	12 (5)	15 (5)	ns	82 (1)	17 (5)	ns	ns	ns

numbers listed are: average PFOS concentration (# of fish)
<dl – less than the detection limit ≈ 5 ng/g
ns – not sampled
comp – composite; tissue from several fish is combined then PFCs are measured

Samples were analyzed for the 13 different perfluorochemicals listed.

			CAS #
PFBA	C-4	perfluorobutanoic acid	375-22-4

Twin	2.84 (1)	ns	2.88 (3)	ns	3.46 (4)	ns	ns	ns

Numbers listed are: average PFDoA concentration (# of fish)
<dl – less than detection limit (approx. 2.5 ng/g)
ns – not sampled
comp – composite; tissue from several fish is combined prior to analysis

Appendix B

Sources, Fate, and Transport of PFCs in the Environment

Direct Sources of Perfluorinated Chemicals to the Environment

The variety and number of fluorinated compounds currently in production comprise an enormous group of chemicals including drugs, anesthetics, chemotherapeutic agents, many pesticides, and refrigerants, as well polymers such as Teflon® and Goretex® [1]. The environmental fate of most of these compounds is unknown.

This summary is focused primarily on perfluorinated surfactants which include perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) and related compounds that have been the focus of intense environmental study. Perfluorinated surfactants are consistently detected in almost every surface and ground water sample and are almost always found in wildlife and humans. While it is clear that these are not naturally occurring compounds – they are entirely human-made – how these compounds have become so widely distributed in our environment in often very remote locations is less understood. Studies have shown that PFOA, for example, is likely "ubiquitous in the northern hemisphere" without a clear source of that widespread contamination [2]

The direct release of these compounds to the environment through manufacturing processes represents one route of exposure to chemicals like PFOA or PFOS. However, several recent studies show that they can also be generated through the degradation of other fluorinated compounds or products that are not of serious environmental concern.

Fluorinated surfactants are synthesized via two primary methods: through electrochemical fluorination (ECF) or through a telomerization manufacturing process[1, 3]. ECF is the process that 3M uses to produce fluorinated compounds. This process begins with sulfonyl fluorides, fluoroalkyl iodides, or carbonyl fluorides, and results in numerous perfluorinated carbon (PFC) compound isomers and byproducts. It results in isomeric mixtures of PFC that are typically 30% branched isomers and 70% straight carbon chain isomers [1, 3]. ECF was used to produce the fluorinated surfactants PFOA and PFOS, non-volatile perfluorinated surfactants that are used in fire-fighting foams (aqueous film-forming foams, or AFFF), paints, polishes, films, and lubricants. ECF is the only process used to directly produce PFOA and PFOS, with over 6 million pounds produced in 2000 [3].

The major contributors to environmental loads appear to be direct sources from the use of PFOA and the ammonia salts of perfluorononanoic acid (PFNA) in fluoropolymer manufacturing [4]. The chemicals produced through ECF from sulfonyl fluorides include PFOS, *N*-methylperfluorooctanesulfonamidoethanol (*N*-MeFOSE), and *N*-ethylperfluorooctanesulfonamidoethanol (*N*-EtFOSE)[1, 3]. The latter two volatile sulfonamide alcohols are themselves building blocks for a variety of polymers, chemical intermediates, and other perfluoroalkyl substances, and were used to produce carpet treatments and paper coating materials[3]. Due to their volatility, *N*-MeFOSE, and *N*-EtFOSE have been found in atmospheric samples.

A primary use of fluorinated chemicals is in the synthesis of fluorinated polymers. Polyfluoroalkylphosphate surfactants (PAPs), for example, are produced from *N*-EtFOSE and have been used in food contact paper products since 1974. *N*-MeFOSE was the primary ingredient in the production of polymers used for coating fabrics and carpets, such

as 3M's ScotchGard® products [5]. sOf the compounds produced through the ECF process, 3% were used in fire-fighting foams, 10% were used as industrial surfactants and coatings, 37% were used in textile, leather, and carpet coatings, and 41% of fluorinated alkyl substances were used for paper and packaging.

Telomerization, is DuPont's process of manufacturing fluorinated alkyl compounds[1]. In this process, only chemicals that consist of straight-carbon chains are produced (as opposed to straight or branched perfluorinated chains produced by ECF process). This is the now the major fluorotelomer manufacturing process since 3M phased out production of PFOA and PFOS in 2000.

Unlike the ECF process, telomerization is often used to make fluorotelomer alcohols (FTOHs)[1], which are characterized by the presence of a terminal ethanol group. FTOHs vary in the number of fluorinated carbons that are attached to the alcohol group. Due to the feedstock and the chemical manufacturing method, they always contain an even number of carbons. FTOHs are not used directly in commercial applications. Rather, they are used as reactive intermediates in the manufacture of other fluorosurfactants and PFC polymer products, where they are often present in residual amounts of up to 4% by weight [6].

Indirect Sources of Fluorinated Chemicals to the Environment

Fluorotelomer Alcohols

The fate of fluorinated and perfluorinated compounds is dependent on the particular chemical in question and the surrounding environment. Due to the high strength of the fluorine-carbon bond, fluorinated chemicals are typically very stable and highly resistant to biological and abiotic degradation. However, some carbon-fluorine bonds are biodegradable under aerobic conditions [7], and recent studies have demonstrated that some fluorinated chemicals can degrade in ways that partially explain patterns of PFC contamination observed in the environment.

Several studies have demonstrated that perfluorocarboxylic acids (PFCAs, which include PFOA and PFBA, perfluorobutanoic acid) and perfluoroalkanesulfonates (such as PFOS and PFBS, perfluorobutane sulfonate) are extremely persistent in surface water, soil, and ground water, and are unlikely to break down. Moody, et al. [8] reported that the PFCAs PFOA and perfluorohexanoic acid (PFHxA) as well as PFOS, were very persistent in surface water into which fire-fighting foam was spilled, and were detected in fish liver tissue over years of sampling after the spill. PFCAs were also persistent in ground water where AFFF fire-fighting foam was used for training[9]. These studies focused on surface water or ground water contamination that was attributable to an identifiable source or spill. The reasons for widespread, low-level contamination of soil, ground water, and surface water in the ambient environment, however, are not clear, because it is difficult to explain how non-volatile PFCA salts such as PFOA could be transported to areas far from a likely source of these chemicals.

FTOHs are usually precursors to the production of fluoropolymers used in paper and carpet treatments, paints, adhesives, waxes, and polishes. They are considered semi-volatile, but their environmental fate is dictated by their partitioning behavior [10]. They have a vapor pressure of 140 – 990 Pa and partition into the atmosphere, where they have been detected

at concentrations of 17 - 135 picograms m^{-3} [11]. FTOH is known to break down abiotically in the atmosphere with roughly a 20 day half-life, yielding the corresponding PFCAs such as perfluorodecanoic acid (PFDA) [2, 11]. With over 10 million pounds of FTOH produced per year, Ellis et al. [11] concluded that enough FTOH is manufactured yearly to maintain currently observed concentrations of PFCAs in the environment. The process of FTOH degrading to PFCAs may account for the estimated 0.4 tons of PFOA deposited in the arctic annually [2]. FTOHs can also undergo biological breakdown to PFCAs (e.g. PFOA), during aerobic treatment of wastewater treatment plant (WWTP) sludge via beta-oxidation. Between 1 – 10% of FTOH is converted to PFOA in this treatment process [7, 10].

The degradation of FTOHs to PFCAs is consistent with the observations made of the distribution of PFC in other studies:

- The appearance of PFDA in fish samples in Minnesota is consistent with the breakdown of 10:2 FTOH to PFDA. The longer chain PFCAs have no significant history of intentional industrial production [12], and there is no known natural source of long-chain PFCAs [11].

- DeSilva and Mabury [12] report that 98% of human blood samples from the Midwest in 2004-2005 consist of straight-chain, telomere-based PFOA, implying that only 11% of the PFOA exposure was to ECF-derived PFOA. They attributed 89% of the PFOA to fluorotelomer-based production methods.

- Recent MPCA studies show that various perfluorinated surfactants – including PFOA and PFOS – were present in the atmosphere in 2008. The presence of these compounds in the air can be explained by the photodecomposition of FTOH molecules in the atmosphere. 3M discontinued manufacture of these PFCs in 2000.

- Minnesota ground water monitoring shows PFOA, PFPeA (perfluoropentanoic acid), PFHxA, PFHpA (perfluoroheptanoic acid), and PFNA at low concentrations that are widespread under ambient conditions, with no known or likely sources of these compounds. The degradation of FTOH compounds to these corresponding PFCAs is a plausible source of these PFCA detections in the ambient environment.

Fluorinated Polymers

Fluorinated polymers are produced in far greater volumes than the fluorinated surfactants. However, very little has been published regarding the fate and behavior of fluorinated polymers in the environment [3]

Synthetic polymers in general are typically very resistant to biological or non-biological degradation. Studies on fluoroacrylate polymers indicate that these compounds have a 1200 year half-life and the biodegradation of fluoroacrylate polymers is expected to add only a very slight amount of PFCA to the global pool of PFCAs [13]. However, PAPs – polymers used extensively for oil and water-resistant coatings on food contact paper products – degrade into FTOHs and subsequently to a toxic fluorotelomer aldehyde intermediate, which, in turn, degrades to fluorotelomer carboxylic acids such as PFOA [5]. The degradation of PAPs was found to occur in the gastrointestinal tract and bloodstream of

laboratory animals. *With PAPs representing 20% of all PFCs produced for paper coatings, this represents a significant source of exposure to PFCAs like PFOA.*[5].

PAPs are typically generated from monomers of *N*-EtFOSE, which are produced through the ECF process described above. Studies conducted by 3M indicated that *N*-EtFOSE can aerobically degrade to PFOS in wastewater in 35 days. Another study found that biodegradation of *N*-EtFOSE in wastewater did not generate PFOS in wastewater [14], although it did anaerobically degrade to related compounds. This work suggested that the transformation of *N*-EtFOSE to PFOS may not occur within the typical hydraulic residence time of a WWTP, and implied that any PFOS in WWTP effluent is likely due to PFOS present in the in influent. It appears that much of the PFOS in a WWTP is removed. Shultz et al [3] estimated that 98% of PFOS was removed in WWTPs.

N-MeFOSE was typically used to manufacture fluorinated-polymer coatings for fabric and carpet. Shoeib et al [15] found that indoor air concentrations of *N*-MeFOSE and *N*-EtFOSE were roughly 10-20 times greater than outdoor concentrations. It has been suggested that these compounds can break down into PFOS directly in the atmosphere [16] thereby providing a route of human exposure to PFOS ingestion and inhalation inside the home where these products have been used. The breakdown of *N*-MeFOSE and *N*-EtFOSE to PFOS may also explain in part the presence of PFOS in remote environments, since *N*-MeFOSE and *N*-EtFOSE volatilize and can be transported through the atmosphere, eventually breaking down to PFOS [17]. However, it may also be possible for PFOS to condense onto atmospherically mobile aerosol particles that are then transported over long distances and eventually deposited in remote locations [17].

In soil, PFOS has been found to adsorb to various iron minerals, with adsorption increasing with PFOS concentration [18]. However, PFOS apparently adsorbs to soil less than hydrocarbons of similar size [18]. Other studies with PFC surfactants show that the organic carbon concentrations in the soil and PFC size are the most important factors influencing sorption to soil [19]. In addition, low pH and high Ca^{+2} in soil solution increases the adsorption of these compounds, suggesting that electrostatic interactions are important in the sorption of PFOS and other PFC surfactants to soil and sediment [19]. Microcosm studies conducted on ground-water sediment collected from the Washington County landfill [20] indicated that adsorption of PFOS and PFOA may be dependent on the oxidation/reduction status of the ground water, implying that these compounds may become more mobile in highly reduced ground water aquifers.

Appendix C

Summary of PFC Toxicity Studies

*Please note: This is not an exhaustive list and other studies may exist that the author was not aware of at the time of printing.

Species or Type of Assay	**Compound and Exposure Concentrations** (mg/kg bw/day unless otherwise noted)	**Endpoint**	**Effect Concentration** (mg/kg bw/day unless otherwise noted)	**Reference**
Rat 90 day oral exposure	PFOS potassium salt 0, 30, 100, 300, 1000, 3000	Death Changes in organ and body weight	LC_{50} = 100 LOAEL = 30	Goldenthal et al., 1978
Rat 2 generation reproductive toxicity	PFOS potassium salt 0.1, 0.4, 1.6, 3.2 by gavage	Significant reduction pup weight gain in F1 generation	LOAEL = 0.4 NOAEL = 0.1	Christian et al., 1999
Rat 2-year dietary study	PFOS 0.06 – 0.23 (males) 0.07 – 0.21 (females)	Histopathological changes in liver	LOAEL (both sexes) = 40.08 µg/g in liver And 13.9 mg/L in serum	Covance Laboratories, Inc. 2002
Rhesus monkeys 90 day gavage	PFOS potassium salt 0, 0.5, 1.5, 4.5	100% Death Gastrointestinal toxicity	4.5 LOAEL = 0.5	Goldenthal et al., 1978
Cynomolgus monkeys 26 weeks	PFOS	Thymic atrophy (females) Reduced HDL, cholesterol, triiodo-thyronine, total bilirubin (males)	LOEL = 0.03 Corresponding to mean concentrations in female and male sera and liver of 19.8 µg/mL and 14.5 µg/g, respectively	Covance Laboratories, Inc. 2002
Fathead minnow (*Pimephales promelas*) 96 h and 42 d	PFOS lithium salt	Death	LC_{50} (96h) = 4.7 mg/L NOEC (42d) = 0.3 mg/L	OECD, 2002
Mysid shrimp (*Mysis bahia*)	PFOS lithium salt	Death	LC_{50} (96h) = 3.6 mg/L NOEC = 0.25 mg/L	OECD, 2002
Aquatic midge (*Chironomous tentans*)	PFOS	Growth and survival	NOEC (10d) = 0.0491 mg/L	Macdonald et al., 2004
Green Algae (*Pseudokirchnerilla subcapitata*)	PFOS	Cell density	IC_{50} (96h) = 48.2 mg/L NOEC = 5.3 mg/L	Boudreau et al., 2003
Mallard duck (*Anas platyrhyncos*) 21 weeks in feed	PFOS	Reduced testes size and decreased spermatogenesis	10 mg/kg diet corresponding to serum and liver concentrations of 87.3 µg/mL and 60.9 µg/g, respectively	3M, 2003

Species or Type of Assay	Compound and Exposure Concentrations (mg/kg bw/day unless otherwise noted)	Endpoint	Effect Concentration (mg/kg bw/day unless otherwise noted)	Reference
Bobwhite quail (*Colinus virginianus*) 21 weeks in feed	PFOS	Increase in liver weight (female) Increased incidence of small testes size (male) Reduced chick survivability as a percentage of eggs set	10 mg/kg diet	3M, 2003
Marine Mussel (*Mytilus californianus*)	PFNA PFDA	Inhibition of p-glycoprotein cellular efflux transporter resulting in chemosensitization	IC50 (PFNA) = 4.8 µM IC50 (PFDA) = 7.1 µM	Stevenson et al., 2006
Male Rats 14 day oral	PFDoA 1, 5, 10	Decreased absolute testes weight Increased total serum cholesterol Increased luteinizing hormone Decreased testosterone Reduced mRNA expression of genes involved in cholesterol transport and steroid synthesis	10 10 10 5 and 10 5 and 10	Shi et al., 2007
Medaka (*Oryzias latipes*)				
MCF-7 Breast Cancer Cells *In vitro*	6:2 and 8:2 FTOH	Breast cancer cell proliferation	10 µM	Maras et al., 2006
Tilapia Hepatocytes *In vitro*	PFOS PFOA 6:2 FTOH 8:2 FTOH	Estrogenicity determined by vitellogenin induction	3.1×10^{-7} M 5.1×10^{-7} M 1.1×10^{-6} M 7.5×10^{-7} M	Liu et al., 2007

PFCs and Class B Firefighting Foam

Remediation • January 2009

Minnesota Pollution Control Agency

What do doughnut bags, outdoor clothing, stain-resistant carpet, non-stick frying pans, aircraft hydraulic oils, and certain firefighting foams have in common? They contain man-made chemicals called perflurochemicals (PFCs). Many kinds of PFCs have been used for several decades to make products stain resistant, water repellant, slippery, and long lasting. Without PFCs, the cooking grease would seep through our fast-food bags, our car seats and carpets would be more stained, and fighting a petroleum fire might be more difficult.

In recent years, scientists have found that PFCs may cause long-lasting environmental contamination, including uptake into humans' bodies. Of particular concern is the possibility that PFCs in Class B firefighting foam may be able to travel from a fire training area to a city's municipal or private wells. Sampling will be done in 2009 to investigate that possibility.

PFC Background

The Minnesota- based 3M Company in Cottage Grove developed PFCs in the late 1940's. PFCs have properties that make them great surfactants. Their chemical structure makes them extremely resistant to change or breakdown. Once released to the environment, they remain there for a very long time. They also travel long distances through soil and into the ground water in a relatively short time. As a result, PFCs have been found in soil, sediments, water, wildlife and humans throughout the world. The way PFCs have become so widespread is not well understood.

Because of the unexpected worldwide spread of PFCs, 3M discontinued manufacture of products containing PFOS and PFOA (two of the PFC chemicals) in 2002. 3M's Class B firefighting foam was included. PFC chemicals continue to be produced by other methods and in different forms by 3M and other companies across the world. Some of these products may travel through air and breakdown to problematic PFCs.

Wastes from 3M's manufacturing processes were placed at several disposal sites in Washington County. PFCs have been found in the ground water in areas of Washington and Dakota Counties, and in surface water and wastewater effluent in other parts of the state. PFCs have also been found in some fish in the greater metropolitan area. Filters containing activated carbon or reverse osmosis units are now filtering PFCs from wells with PFC levels that exceed the Minnesota Department of Health's (MDH) health-based exposure limits. Fish consumption advisories have been issued for some lakes.

Health Concerns

The potential health significance of PFCs in drinking water is under study at both the state and federal levels. Much of this research consists of toxicological studies in laboratory animals. At high concentrations, two types of PFCs, perfluorooctane sulfonic acid (PFOA) and perfluorooctonate sulfonate (PFOS), have been shown to cause harmful changes in the liver and developmental problems (e.g., delays in growth and maturation) in the offspring of rats and mice exposed during pregnancy. A limited number of other PFC chemicals are also being studied.

There are few studies of health effects in people. As part of its worker health and safety program, 3M routinely monitored the health of its workers. No significant or consistent health effects have been identified in these workers. Three studies of newborn babies and PFC levels in the mother's blood found a very small decrease in birth weight or other measures of growth with increasing PFC levels in the mother. A large health study of 70,000 people exposed to the type of PFC called PFOA in drinking water in Ohio and West Virginia is currently underway but it will be some time before results are available. In general, the

studies in people have shown that the levels of PFCs in the environment may be linked to changes in the body, but the studies have not shown specific illness in people.

Firefighting Foam

There are many kinds of firefighting foam. The use of foam has saved many lives and prevented huge property losses. Many manufacturers have made firefighting foams, but the exact content of those foams is often not disclosed.

Class A foam has come into widespread use in recent years for wildfire, structure and other fires. A detergent-like "surfactant" in the Class A foam makes the firefighting water "wetter" and more able to penetrate combustible material. **Class A foams typically do not contain PFC chemicals.**

PFCs and Class B foam training near wells

In the early 1960's, 3M and the U.S. Navy developed Class B "aqueous film forming foam" (AFFF) type foams. Class B foams are used on flammable petroleum fires and spills. Some or most Class B foams have had PFCs as part of their formulation, in particular PFOS.

Some foam manufacturers have changed processes and materials to eliminate or minimize PFC content in foam. However many foam manufacturers may not know or reveal PFC content of current or past formulations.

As part of the overall investigation of PFCs in Minnesota, the Minnesota Pollution Control Agency (MPCA) and MDH have started looking at the pattern of firefighting foam training.

Most Minnesota cities use ground water as a drinking water source. Many municipal wells are near a fire station or fire training locations. There is a possibility that fire training sites where Class B foams were repeatedly used may have allowed PFCs to enter municipal or private drinking water wells.

In 2008 an MPCA contractor, Delta Environmental, surveyed Minnesota's fire service on past foam use – two-thirds of fire departments provided information. Many departments have used and trained with Class B foam. The foam was usually used in small amounts; however, it may only take a small amount of chemical to affect ground water. MDH has taken the survey data and compared it to municipal well locations and characteristics. Most cities that use wells have wellhead protection plans that map the areas where spills and pollution may reach a well. Fire chiefs should become familiar with these plans. Cities with wells that are vulnerable because of their shallow depth or coarse soils or their proximity to foam training locations have been identified. MDH will be sampling wells in many of those cities in spring of 2009. If PFCs are found, MDH will notify the water utility.

MPCA will be sampling soil near 25 or so Class B foam training sites in the spring of 2009 to see if PFCs remain in the soil and ground water. Fire chiefs will be notified before sampling to request site access and permission. Results will be provided back to the cities.

Next Steps

Results from the first round of sampling are expected in summer 2009. In the meantime, the State Chiefs' Association and the State Fire Marshal will be asked to help suggest guidance to Minnesota's fire service on Class B foam. Likely, that guidance will include:

- using Class B foam on flammable liquids like gasoline, but not routinely using on other combustible liquids such as diesel or fuel oil
- using non-PFC training foams or detergents during training
- investigating PFC content of the currently sold Class B foams

Additional information about PFCs is available on the MPCA and MDH web pages at:

PERFLUOROCARBONS IN FIREFIGHTING FOAM
AND THEIR USE IN MINNESOTA

1.0 INTRODUCTION

1.1 Purpose

Delta Consultants (Delta) has worked under contract with the Minnesota Pollution Control Agency (MPCA) investigating perfluorochemicals in Class B firefighting foams and their use in Minnesota. Previous information regarding this investigation was presented in the following reports:

- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use In Firefighting Training in Minnesota, dated June 30, 2008 (the June 2008 Report); and,
- Addendum to PFC-Containing Firefighting Foams and Their Use In Firefighting Training in Minnesota, dated October 22, 2008 (the October 2008 Addendum Report);
- Firefighting Training Area Site Reconnaissance, Pine Bend Flint Hills Refinery, Marathon Refinery, Burnsville Fire Training Center, and Site Access for 21 Fire Departments, dated April 3, 2009 (the April 2009 Report);
- Report of Site Reconnaissance and Sampling at Select Firefighting Foam Training Areas in Minnesota, dated June 30, 2009 (the June 2009 Report); and,
- Report of Investigation Activities at Select Firefighting Foam Training Areas and Foam Discharge Sites in Minnesota, dated February 10, 2010 (the February 2010 Report).

This report condenses the previous reports and includes PFC sampling conducted by others at the following fire foam training and fire sites:

- Duluth Air National Guard Base at the Duluth International Airport;
- Western Area Fire Training Academy (WAFTA) in St. Bonifacius;
- Up North Plastics in Cottage Grove; and,
- Kings Cover Marina in Hastings.

1.2 Background

As a part of an overall investigation of PFCs in Minnesota, the MPCA and Minnesota Department of Health (MDH) started looking at firefighting foams as a possible source of PFCs in the environment. In 2008 PFCs were researched as a constituent of firefighting foams. Municipal fire departments, fire departments at major oil refineries and airports, and fire training schools in the State were surveyed regarding their use of Class B firefighting foams. Additionally, various persons in the State with fire fighting knowledge and experience were interviewed. A survey questionnaire mailed out to the fire departments concentrated on the use of firefighting foams in training based on the assumption that training areas where firefighting foams were discharged repeatedly at the same location would be at greater risk for the introduction of PFCs into the environment via the breakdown of the foam. The firefighting training sites were then ranked for their potential

to release PFCs to sensitive environments based on a number of criteria: the types and amounts of foam used in training, the frequency of the training events, the environmental setting of the firefighting training site, and the presence of nearby water supply wells. The results of the research, survey and training site ranking were presented in the June 2008 and October 2008 Addendum Reports. Both reports are available on the MPCA website at www.pca.state.mn.us/cleanup/pfc/index.html. A brief summary of the research and survey findings are presented in Sections 6.0 and 7.0 of this report.

Based on the site ranking, twenty-one firefighting training sites were chosen for further investigation. The additional investigation included site reconnaissance, sampling of the groundwater and/or soil, and/or additional interviews. Information and data collected at these "priority" sites were documented in the April 2009, June 2009 and February 2010 Reports. These reports are also available on the MPCA website.

During the course of the PFC-Firefighting Foam investigation it was decided that the locations of several fires where large quantities of PFC-containing foams were utilized would also be investigated for the possible release of PFCs to the environment. Information and data collected at the River Grove Marina in Inver Grove Heights, and the Kandiyohi County Landfill in New London, were included in the above-referenced reports. Reports of PFC sampling related to firefighting foam conducted by the MPCA and other consultants at the Duluth Air National Guard Base in Duluth, the WAFTA site in St. Bonifacius, the Up North Plastics facility in Cottage Grove, and the Kings Cove Marina in Hastings, are available at the MPCA. The investigation activities and results for all of these sites are discussed in Sections 6.0 and 7.0 of this report.

2.0 PFCs in FIREFIGHTING FOAM

Perflourocarbons or perfluorochemicals (PFCs) are a class of man-made chemicals derived from hydrocarbons, where the hydrogen atoms have been replaced by fluorine atoms. PFCs are characterized by chains of carbon atoms of varying lengths to which fluorine atoms are strongly bonded, making PFCs durable and hard to break down (1). PFCs have been used since the 1950s to produce industrial and consumer products that are heat and stain resistant, water repellant, and film-forming (2). PFCs have been used in a variety of products including stain-resistant fabrics and carpet, coatings for food packaging, non-stick cookware, and firefighting foams (2)(3)(4).

2.1 Chemistry of PFCs

The PFC class of chemicals includes three groups of PFCs pertinent to the discussion of PFCs in firefighting foam: perfluorocarboxylates, perfluorinated sulfonates, and fluorotelomer sulfonates (5).

Perfluorocarboxylates are fully fluorinated carbon molecules with a carboxylate group on the end of the chain. Perfluorinated sulfonates are fully fluorinated carbon molecules with a sulfonate group on the end of the chain. Fluorotelomer sulfonates are partially fluorinated molecules. Examples of the PFC chemicals within each group are described in Table A, below.

TABLE A - PFC CHEMICALS

Chemical Group	Chemical Acronym	Chemical Name	CAS Registry No.	No. of Fluorinated Carbon Chains
Perfluorinated carboxylic acids	PFBA	perfluorobutanoic acid	375-22-4	4
	PFPeA	perfluoro-n-pentanoic acid	2706-90-3	5
	PFHxA	perfluorohexanoic acid	307-24-4	6
	PFHpA	perfluoroheptanoic acid	375-85-9	7
	PFOA	perfluorooctanoic acid	335-67-1	8
	PFNA	perfluorononanoic acid	375-95-1	9
	PFDA	perfluorodecanoic acid	335-76-2	10
	PFUnA	perfluoroundecanoic acid	2058-94-8	11
	PFDoA	perfluorododecanoic acid	307-55-1	12
	PFTA	perfluorotridecanoic acid	not determined	not determined
Perfluorinated sulfonates	PFBS	perfluorobutane sulfonate	29420-49-3	4
	PFHxS	perfluorohexane sulfonate	355-46-4	6
	PFOS	perfluorooctane sulfonate	1763-23-1	8
Fluorotelomer sulfonates	6:2 FtS	1-octanesulfonic acid, 3,3,4,4,5,5,6,6,7,7,8,8,8-tridecafluoro-, ammonium salt	--	6
	8:2 FtS	--	--	8

PFCs are made using one of two methods: the Simons electro-chemical fluorination (ECF) developed by 3M; or, a telomerization process (6).

2.1.1 ECF Process

The ECF process used by 3M generates fully fluorinated compounds in branched- and straight-chains with both even and odd numbers of perfluorocarbons (6)(7). The chemical of interest in the ECF process is perfluorooctanesulfonyl fluoride (POSF), $C_8F_{17}SO_2F$. The final degradation product of POSF and its derived products include perfluorinated sulfonates and perfluorinated carboxylic acids (8). While perfluorinated carboxyl acids are associated with both the ECF process and the telomerization process (see Section 2.1.2), perfluorinated sulfonates only result from the ECF process (9).

2.1.2 Telomerization Process

The telomerization process creates fluorinated telomers that are different from ECF-made fluorinated molecules in that they only have an even number of fluorinated carbon atoms and the molecule is predominantly straight-chained (6)(7). In addition, the fluorotelomerization process inserts an ethyl group between the fluoroalkyl chain and the functional group on the end, which differentiates the atom from an ECF-process fluorinated molecule. Fluorotelomer sulfonates are made using a telomerization process, and perfluorinated carboxylic acids may be present in the final product as a result of unreacted or partially reacted starting materials or intermediate (10).

2.2 PFCs in Firefighting Foam

There are several classes of fires, depending on the material that is burning. Class B fires involve the burning of flammable liquids such as gasoline, fuel oil, cleaning fluids and solvents. Aqueous film-forming foam (AFFF) was developed in the 1960s for use on Class B fires. AFFF has a fluorochemical-based surfactant that rapidly forms a film across the fire surface, which prevents the release of flammable fuel vapors and excludes oxygen from the fuel surface (11).

3M was the original manufacturer of fluorochemical-based AFFF in the 1960s, using the ECF process. As indicated in Section 2.1.1, PFCs made using the ECF process can contain or degrade to perfluorinated sulfonates and perfluorinated carboxylic acids. As part of 3M's voluntary production phase out of PFOS chemicals, they stopped manufacturing PFOS-based AFFF in 2002.

DuPont, Ansul, Chemguard and other firefighting foam manufacturers use telomer-based fluorochemical surfactants in their AFFF. The telomer-based foams are not made with, and do not break down to, PFOS. According to the Fire Fighting Foam Coalition (www.fffc.org), telomer-based firefighting foams contain predominantly (75 to 80%) six-chain carbon fluorosurfactants (6:2 FtS), with varying percentages of eight-chain or higher homologues (8:2 FtS). While telomer-based surfactants are not made with PFOA, low levels of PFOA may be present as a byproduct (13).

Class B AFFF is typically purchased in five-gallon buckets. These foam concentrates are mixed into the water using an in-line eductor or other proportioning/mixing device. The foam concentrate/water solution can then be fed through one of two types of discharge devices, either a nozzle-aspirated foam system (NAFS) or a compressed air foam system (CAFS). Both systems produce a finished foam that is a combination of water, air and foam concentrate. Class B AFFF concentrates may or may not have expiration dates included on the product container, but foam manufacturers Chemguard and Ansul indicate that Class B foam should have a shelf life of 20 to 25 years if stored properly.

Class A firefighting foams, used to extinguish wood and grass fires, are detergent-based foams with a hydrocarbon-based surfactant, not a fluorochemical-based surfactant (14). Class A foams are not known to contain PFCs and are not considered a source of PFCs.

Training foams are similar to Class A and Class B foams but are made specifically for fire training exercises and do not contain chemical components for firefighting performance. Training foams are available from most manufacturers and are generally less expensive because they do not contain (costly) fluorinated surfactant components. Training foams are not made with PFCs.

2.3 The USEPA and PFOA and PFOS

In 1999 the U.S. Environmental Protection Agency (USEPA) began an investigation into PFOS after receiving data from 3M that PFOS was persistent, bioaccumulative and unexpectedly toxic (15). Ultimately 3M ceased production of PFOS-based chemistry in 2002, including the production of PFOS-based firefighting foams.. 3M also identified PFOA in human blood as part of their PFOS studies (15), and in June 2000 the USEPA expanded their investigation to include other PFCs, including PFOA.

In 2002 and 2007 the USEPA published significant new use rules (SNURs) under the Toxic Substances Control Act (TSCA) to limit the manufacture or import of perfluoroalkyl sulfonate chemicals, including PFOS and PFHxS. According to the initial 2002 SNUR, 3M was the only manufacturer in the U.S. of PFOS-based chemicals included in the SNUR.

In January 2006, USEPA and eight major PFC manufacturing companies (3M/Dyneon, Arkema, Inc., AGC Chemicals/Asahi Glass, Ciba Specialty Chemicals, Clariant Corporation, Daikin, E.I. duPont de Nemours and Company, and Solvay Solex) created the 2010/15 PFOA Stewardship Program. The companies committed to reduce facility emissions and product content of PFOA, PFOA precursor chemical, or PFOA-related homologues by 95 percent by 2010, and to work toward eliminating emissions and product content by 2015. As part of the program the companies submit annual reports on their progress toward reaching the goals. Information regarding the 2010/15 PFOA Stewardship Program is available at www.regulations.gov in docket EPA-HQ-OPPT-2006-0621.

Members of the Fire Fighting Foam Coalition that make telomer-based AFFF agents are in position to meet the goals of the PFOA Stewardship Program before 2015 by using C6-based fluorosurfactants that provide the same fire protection characteristics as C8-based foams. Incorporating these new fluorosurfactants in AFFF will require some reformulation and perhaps re-approval of most Class B foams between 2010 and 2015 (16).

3.0 USE OF FIREFIGHTING FOAMS IN MINNESOTA

In order to gain an understanding of the organizations in Minnesota that utilize firefighting foam, the types and quantities of firefighting foam being used, and the locations where the foams are being used in training exercises, the websites of firefighting organizations were reviewed, individuals commonly known to be involved in or associated with firefighting in Minnesota were interviewed, and the users of firefighting foams in Minnesota were surveyed regarding their foam use.

3.1 Interviews with Minnesota Firefighting Organizations

Several individuals commonly known to be involved in or associated with firefighting in Minnesota were interviewed regarding the use of firefighting foams in Minnesota. The interviews were presented in the June 2008 Report. Key findings of these interviews are as follows: the two oil refineries in Minnesota—the Marathon Oil refinery in St. Paul Park and the Flint Hills Resources Pine Bend refinery in Rosemount—have their own dedicated fire departments; that the Minnesota Department of Natural Resources (MDNR) trains firefighters at the Minnesota Interagency Fire Center in Grand Rapids using training foam; the Minnesota State Colleges and Universities (MNSCU) system has sixteen schools with firefighting training programs, and they switched from the use of AFFF to soap-based foams for training in approximately 2004; and that generally AFFF is not used for training exercises because its too expensive.

3.2 Survey Mailing to Minnesota Firefighting Organizations

Questionnaires regarding the use of firefighting foam were mailed to 785 fire departments in Minnesota in April and May 2008. The questionnaire surveyed the departments on current and historical types and amounts of firefighting foam used in firefighting and fire training, the locations of the fire training areas, and the fate of the spent training foam. In addition to municipal fire departments, questionnaires were mailed to the following potential firefighting foam users in Minnesota:

- All of the airports with dedicated fire departments: Minneapolis-St. Paul International Airport (MSP); Rochester International Airport; and, the Duluth International Airport.
- The following 16 colleges with firefighter training programs: Itasca Community College in Grand Rapids; Alexandria Technical College; St. Cloud Technical College; Minnesota West Community College in Marshall; Ridgewater College in Willmar; South Central College in North Mankato; Riverland Community College in Austin; Pine Technical College in Pine City; Hennepin Technical Colleges in Plymouth and Eden Prairie; Northland Community Colleges in Thief River Falls and East Grand Forks; Central Lakes College in Brainerd; Minnesota State Community College in Moorhead; Mesabi Range Community College in Virginia; and, Lake Superior Technical College in Duluth. Southwest State University in Marshall, Minnesota indicated that they do not offer a firefighting training program and that their program is only a business administration program for fire chiefs and captains.
- 2 petroleum refineries; and,
- Camp Ripley in Little Falls.

Completed questionnaire surveys were presented in the June 2008 Report and October 2008 Addendum Report.

3.3 Survey Results

Results of the completed surveys received from the municipal fire departments, airports, firefighting training schools, refineries, and Camp Ripley are presented in Sections 3.3.1 through 3.3.5.

3.3.1 Survey Results - Municipal Fire Departments

A total of 522 completed questionnaires were received from the 785 municipal fire departments that were surveyed, a response rate of 66%. Copies of the completed questionnaires were included in the June 2008 Report and October 2008 Addendum Report. The following general findings and statistics were ascertained from the questionnaires:

- Fifty-two (or 10%) of the responding municipal fire departments do not use firefighting foam at all.
- Of the responding municipal fire departments that utilize firefighting foam, 243 (or 52%) use only Class A foams.
- Of the remaining 227 responding municipal fire departments that utilize Class B firefighting foams, approximately 50% do not train with Class B foam but only use Class B foam for fire response.
- Of the municipal fire departments that train with Class B foam, 28% of the departments train at multiple or different locations for every training session, or at live burns only. Thus there is not one specific training location.
- The remaining municipal fire departments that train with Class B foam repeatedly at the same location were ranked based on the potential for PFCs to enter sensitive environments. The ranking criteria are discussed in Section 5.0.

3.3.2 Survey Results – Airports

Of the seven airports operated by the Metropolitan Airports Commission, (Crystal, Lake Elmo, Flying Cloud, Anoka County-Blaine, St. Paul, Lakeville and Minneapolis-St. Paul International (MSP), only MSP has its own fire department. Other MAC airports are served by the municipal fire departments in which they are located. Currently the MSP fire department trains with foam at the Lake Superior College Emergency Response Training Center (ERTC) in Duluth. Prior to 2001 training with 3M-brand Class B foam was conducted at two different locations on the northwest portion of the airport.

The Rochester Airport Fire Department also trains with foam at the ERTC facility in Duluth. However, the Federal Aviation Administration (FAA) requires annual testing of fire equipment. The foam equipment tests require a short burst of foam to show that the fire trucks are functioning properly. Less than 5 gallons of Chemguard-brand Class B foam is used annually for equipment testing.

The City of St. Cloud Fire Department is responsible for fire response at the St. Cloud Airport. The St. Cloud Fire Department trains with Chemguard-brand Class B foam at two locations, including the fire station near the airport.

The 148th Fighter Wing of the Minnesota Air National Guard is responsible for fire and emergency services at the Duluth International Airport. The unit no longer trains at the airport with firefighting foam. The MPCA is investigating two former fire training areas at the Duluth Airport for PFCs.

3.3.3 Survey Results - Firefighting Training Schools

Survey questionnaires were returned by all sixteen MNSCU firefighting training schools. Only two of the schools hold training exercises on campus with Class B foam: Lake Superior College in Duluth; and, Northland College in East Grand Forks.

3.3.4 Survey Results - Petroleum Refineries

Both the Marathon Refinery in St. Paul Park and the Flint Hills Resources Pine Bend Refinery in Rosemount have their own in-house fire departments, and both refineries have on-site fire fighting training facilities where spent Class B foam is collected and routed through their in-house wastewater treatment plants. The fire department at the Marathon Refinery uses approximately 50 to 100 gallons of Ansul-brand ThunderStorm Class B foam per semi-annual training event; prior to 2000 they used 3M-brand foam. Other municipal departments train at the Marathon Refinery fire training area, using foam provided by the Marathon Refinery fire department. Fire foam training at the Pine Bend Refinery in Rosemount takes place approximately 20 to 25 times during the training season from April through November, and approximately 5 to 10 gallons of Ansul –brand ThunderStorm Class B foam is used per training event. The Pine Pend Refinery fire department used 3M-brand Class B foam historically, and has a stockpile of approximately 50,000 gallons of 3M-brand foam on hand. Other area municipal departments train at the refinery training grounds with foam provided by the refinery.

The former Conoco-Phillips oil refinery in Wrenshall, Minnesota ceased operation in the early 1980s. The City of Wrenshall Volunteer Fire Department indicated that the refinery had their own fire fighting equipment, but that the Wrenshall Fire Department responded to any fire calls. The department trained at the Wrenshall refinery with Class B foam when it was in operation.

3.3.5 Survey Results - Camp Ripley

The Fire and Emergency Services Coordinator for Camp Ripley indicated that his position at Camp Ripley had been created in approximately 2007, and he was not familiar with historical firefighting practices at Camp Ripley. No firefighting training with foam is currently being conducted at Camp Ripley.

4.0 RANKING OF FIREFIGHTING FOAM TRAINING SITES

The training sites where Class B firefighting foam is or was used on more than one occasion were ranked in order to identify those with the highest potential to release PFCs to sensitive environments. The sites were ranked according to the criteria listed in Section 4.1. A relative numerical score was assigned for each criterion that was meant to reflect the relative importance of each parameter with respect to its potential to release PFCs to the environment, and the sensitivity of the environmental receptors.

4.1 Ranking Criteria

The criteria are listed below in brief; a more detailed description of the ranking criteria were presented in the June 2008 Report. The following criteria were considered in ranking training sites on their potential to release PFCs to sensitive environments:

1) Brand of foam used for training. Due to the known content of PFOS and PFOA in firefighting foams manufactured by 3M, training sites where 3M foams were currently or formerly used in training were ranked higher.
2) Amount of foam used in training.
3) Proximity to nearby surface waters.
4) Proximity to nearby wetlands.
5) Proximity to karst geological areas.
6) Proximity to wellhead protection areas (WPA) and/or source water assessment areas (SWAA).
7) The presence of water supply wells nearby.

Since spent training foam are released to the ground or go to a storm sewer at most training sites, the final destination of the spent foam was not considered as a ranking criteria.

4.2 Ranking Results

A total of 80 municipal fire departments' training sites, 3 airport fire departments, 2 firefighting training schools, and 3 petroleum refineries were ranked. Rankings for the municipal fire departments are presented in **Table 1, *Class B Foam Use Ranking Summary, Minnesota Municipal Fire Departments***, and rankings for the training schools, airports, and refineries are presented in **Table 2, *Class B Foam Use Ranking Summary, Minnesota Airport and Refinery Fire Departments and Training Schools***. Individual profiles for each of the ranked sites were included in the June 2008 Report and October 2008 Addendum Report.

Total scores assigned to the firefighting foam training sites ranged from 7 to 33. The highest scores were assigned to sites generally located in a wellhead protection or source water protection area and/or a karst

area, had water supply wells located within ¼-mile, a wetland and/or surface water body located within ¼-mile of the training site, and 3M foams are or were used for training. A total of 21 sites were considered for follow-up investigations, as listed below:

- *Minneapolis/St. Paul International Airport former training areas*: MSP Airport is located in a WPA and an active karst area, with up to 40 gallons of foam used annually for training. From 1983 through 2001, fire foam training with 3M-brand Class B foam was conducted east of Cargo Road near the present location of the glycol management facility. Foam training prior to 1983 took place at an area located northeast of the current FedEx facility. Both the pre- and post-1983 former fire foam training areas were re-worked and excavated to some extent during construction associated with the addition of a new airport runway in 2001. Storm water from this area of the airport drains to a holding pond near the southwest corner of the MSP Airport.
- *Marathon Refinery, St. Paul Park:* Marathon Refinery is located in an active karst area near the Mississippi River, with approximately 250 gallons of Ansul-brand foam used annually for training. The Marathon Refinery historically used 3M-brand Class B foams through approximately 2000. Fire foam training is conducted at fire training grounds located near the southwest corner of the refinery. Spent foam and water is routed to an on-site waste water treatment plant.
- *Flint Hills Pine Bend Refinery, Rosemount:* Pine Bend refinery is located in a transition karst area, with approximately 300 gallons of Ansul-brand foam used annually for training. Foams manufactured by 3M were historically used in training. Fire foam training is conducted at fire training grounds near the southwest corner of the refinery. Spent foam is collected into a lined holding area from which it is pumped out and disposed through an on-site waste water treatment plant.
- *Kenyon Fire Department foam training area:* Bi-annual training with 3M-brand foam is conducted on Slee Street, between Cross and Pine Streets at the east end of town. The training area is located in a SWAA and an active karst area.
- *Claremont Fire Department training and foam demonstration areas:* Annual to bi-annual training with 3M-brand foam is conducted on a paved surface in front of the fire station on Front Street, where spent foam and water drain to a storm sewer. In the fall of 2008 a fire foam demonstration was held behind the station. The fire station is located in a SWAA and a transition karst area.
- *Harmony Fire Department foam training areas:* Foam training has occurred at two locations: historically in front of the fire station on Main Avenue South, and more recently at the municipal tree/brush dump south of the fire station. Foam training with Ansul-brand foam takes place annually or less. Both areas are located in a SWAA and an active karst area.
- *Bemidji Fire Department foam training site:* Annual training is conducted with five gallons or less 3M-brand foam at the Bemidji Regional Airport. The airport is located in a WPA with surface waters and wetlands adjacent to the airport and shallow municipal wells located nearby.
- *Fridley Fire Department training site:* Historically, training with 3M-brand firefighting foam took place at the North Metro Fire Training Center on 71st Avenue in Fridley. A training structure was built in 1994/1995 over a burn pit that had been used for foam training. The training center is located in a WPA and a transition or covered karst area.
- *Burnsville Fire Department training site:* The Burnsville Fire Department has trained three times with Ansul-brand foam at the ABLE Fire Training Center since it was built in 1989, and the last training exercise was in 2004. The fire training center is located at the southeast corner of the intersection of Cliff Road and River Ridge Boulevard in Burnsville. The training center is located in a WPA and appears to be situated in an active karst area. Municipal wells are located nearby.
- *Goodview Fire Department training area:* Occasional training (approximately six times in the last twenty years) is conducted on a paved area in front of the fire station located at 4140 W. 5th Street. Spent foam and water drain to a storm sewer which discharges into the backwaters of the

Mississippi River. The fire station and the discharge area are located in a WPA and an active karst area.

- *North St. Paul Fire Department training site:* Semi-annual training with 3M-brand foam takes place at the North St. Paul Public Works facility on 1st Street North. The site is located in a WPA and covered karst area.
- *Richfield Fire Department:* The Richfield Fire Department historically trained occasionally with 3M foam behind the Richfield Ice Arena, located at 636 East 66th Street. The ice arena is located in a WPA and covered karst area, with municipal wells nearby. Surface runoff from the training area would drain to nearby Legion Lake.
- *Rochester Fire Department:* Historically, annual training with 3M-brand foam took place in a parking lot near the northwest corner of the Olmsted County Fairgrounds in Rochester. The site is located in a WPA and active karst area.
- *Luverne Fire Department:* A one-time fire foam demonstration took place in approximately 2005 at the Luverne municipal tree/brush dump. A burn pan was used, and the soils around the burn pan were cleaned up with a payloader afterwards. The site is located in a WPA, and a shallow municipal water supply well located nearby.
- *Lake Superior College Emergency Response Training Center (ERTC):* The potential exists for historical use of 3M or other brand foams at the ERTC from approximately 1994 through 1996. Training foam has been used at the facility since 1996. An on-site wetland is located adjacent to the foam training area, and the St. Louis River nearby. This site was selected for sampling after inquiries received by the MPCA regarding this facility.

Although originally identified as priority sites, additional information collected during follow-up activities that clarified foam use precluded the following sites from sampling: Pierz Fire Department; Cottage Grove Fire Department; Alexandria Fire Department; Myrtle Fire Department; Preston Fire Department; two training sites used by the Brooklyn Center Fire Department; and South Central College in Mankato. Since the MPCA conducted a PFC investigation at the former fire training area at the Duluth International Airport, no further investigation was conducted for this project. Additional inquiries regarding the fire training areas utilized by the Maynard and Hutchinson Fire Departments found that the Maynard Fire Department only uses Class A foam, and the Hutchinson Fire Department did not train with Class B foam at the former training location on the Crow River.

4.3 Additional Foam Discharge Sites

During the course of the PFC/Firefighting Foam project, additional incidents of firefighting foam discharge were brought to the attention of the MPCA. Further investigation was made into foam use at the following sites:

- *Kings Cove Marina, Hastings[(a)]:* In October 2002 a fire at the Kings Cove Marina destroyed several boats which were dry-docked at the west end of the marina. Several fire departments responded to the fire with various brands of Class B foam, apparently including approximately 305 gallons of 3M foam. This firefighting event may have released firefighting foam directly to the Mississippi River. Fish tissue sampling by the MPCA has identified PFCs in fish collected from the Mississippi River in the Hastings area.
- *River Grove Marina, Inver Grove Heights:* A fire occurred on a docked boat at the River Grove Marina on September 26, 2009. The Inver Grove Fire Department responded to the fire with, in

part, Ansul-brand Class B foam, which was discharged onto the burning boat and docks on the Mississippi River.

- *Kandiyohi County Landfill, New London:* A fire occurred at the Kandiyohi County Landfill over several days at the end of October 2009. Several fire departments responded to the fire, and approximately 545 gallons of 3M Class B foam was used on the fire.
- *Crystal Airport:* The Brooklyn Center Fire Chief related that several fire departments responded to a large hangar fire at the Crystal Airport in 2006. Interviews with responding departments found that Class B foam was not used at the hangar fire, but had been used at several plane crash sites at the airport.
- *Up North Plastics, Cottage Grove*[(a)]*:* A fire occurred at the business of Up North Plastics in December 2002. Its been estimated that upwards of 4,000 gallons of foam were used to extinguish the fire. Spent foam migrated into ditches and wetlands north of the facility, and to a storm sewer outlet south of the facility across Jamaica Road. Up North Plastics property is located within an area being investigated to identify sources of PFCs found in private wells in the Langdon and River Acres neighborhoods of Cottage Grove.
- *Western Area Fire Training Academy (WAFTA), St. Bonifacius*[(a)]*:* The WAFTA training facility was operated from 1974 through 1990, at the site of a former Nike Missile launch facility. The site was being investigated by the MPCA for other contaminants when, in May 2006, fourteen monitoring wells were sampled for PFCs. PFCs were detected in several of the wells.
- *Duluth International Airport*[(a)]*:* The Duluth Air National Guard Base and the Duluth Air Force Base both historically used two fire training areas located on the northeast side of the Duluth International Airport for Class B foam training.

(a) Further investigation and subsequent sampling at these sites was conducted by consultants other than Delta on behalf of the MPCA. Since firefighting foams were discharged at these sites, they are being included in this report.

5.0 SITE RECONNAISSANCE AND SAMPLE COLLECTION

Generally, the same or similar procedures were followed for site reconnaissance and sampling at the municipal fire department foam training areas. These procedures were presented in previous reports that detail specific site investigations. The sites where sampling was not conducted by Delta, or were not included in previous reports, are discussed in sections 5.1 through 5.5.

5.1 Sample Collection at the Kandiyohi County Landfill

Groundwater samples were collected for PFC analysis from two existing wells at the Kandiyohi County Landfill. Monitoring well DMW-1A is located upgradient of the C&D portion of the landfill where the fire occurred, and DMW-3 is located approximately 300 to 350 feet away in a roughly downgradient direction. The wells at Kandiyohi County Landfill were sampled on two occasions, in January and May 2010. Soil borings were not advanced at the landfill and soil samples were not collected.

5.2 Sample Collection at WAFTA

Groundwater samples were collected for PFC analysis from fourteen existing wells at the WAFTA site. The groundwater sampling was conducted in May 2006 by ENSR Corporation and is summarized in their report, *Phase II Site Investigation at Former Nike Missile Base MSP-70/Western Area Fire Training Academy,* dated October 2006. Monitoring well MW-4 was situated within the former fire training area, and the other wells were located side-gradient and downgradient of the training area. Monitoring well BG-4 was situated furthest downgradient of the training area, near the southeast corner of the WAFTA site. Soil samples were not collected for PFC analysis at WAFTA. The MPCA followed-up in 2008 and 2009 with sampling of nearby residential water wells for PFCs.

5.3 Sample Collection at the Kings Cove Marinas

At site of the fire at Kings Cove Marina in Hastings, two surface water and two sediment samples were collected from the adjacent Mississippi River where spent foam accumulated. One surficial soil sample was collected where foam was discharged on land. Sampling at Kings Cove Marina was conducted by West Central Environmental Consultants (WCEC). A data report detailing the sampling at Kings Cove Marina was submitted to the MPCA by WCEC on March 8, 2010.

5.4 Sample Collection at Duluth International Airport

Six soil borings were advanced within two former fire foam training areas at the Duluth International Airport for the purpose of collecting groundwater samples only. The sampling was conducted in October 2007 by BB&E, LLC, as presented in their *Groundwater Sampling Report, Duluth Air National Guard Base* dated December 19, 2007. Soil samples were not collected for PFC analysis at the fire training areas. The MPCA is following up with sampling of residential water wells in the area for PFCs.

5.5 Sample Collection at Up North Plastics

Five surficial soil samples were collected from the storm water ditch to which spent foam and water from the Up North Plastics fire reportedly drained. Four sediment and two surface water samples were also collected from a pond at the end of the storm water ditch. Groundwater samples were collected from three irrigation wells which are located at distances up to 1.5 miles away from the Up North Plastics facility. Sampling associated with the Up North Plastics fire was conducted by WCEC in July 2009. WCEC submitted a data report dated September 22, 2009, to the MPCA detailing this sampling.

6.0 SAMPLING RESULTS

Soil and sampling results are summarized in **Table 4, *Soil and Sediment Analytical Results, PFCs***. Groundwater and surface water sampling results are summarized in **Table 5, *Groundwater and Surface Water Analytical Results, PFCs***. The amount of foam used in training or at a fire response, and the foam

brands and the last known approximate date of training or date of foam discharge at a fire, are included on the tables.

Samples were submitted to either Axys Analytical Services LTD (Axys) or MPI Research for analysis of PFCs. Duplicate samples were collected at select sites and submitted to both laboratories for comparison purposes. Samples collected at the WAFTA site were analyzed by the MDH and by Exygen Research, which later became Axys. The laboratories used for analysis are noted in Tables 4 and 5.

According to research, one important factor for the transport of anionic perfluorinated surfactants in soil is the organic content of the soil; soil partition coefficients were found to be linearly related to organic carbon content, and sorption of the anionic perfluorinated surfactants to soil particles increased with increasing perfluorinated chain length (17). Therefore, soil samples collected for PFC analysis at select sites were also submitted to Pace Analytical Services for laboratory analysis of total organic carbon (TOC) via EPA Method SW9060.

6.1 Laboratory Analytical Results, Soil and Sediment Sampling

Laboratory analysis detected PFCs in 52 of the 80 soil and sediment samples analyzed for this project (see **Table 4**). The highest PFC concentrations detected in soil or sediment samples were found in the soil samples collected at the Bemidji Airport and the Richfield Ice Arena, and the sediment sample collected from the on-site wetland at the Lake Superior College ERTC. The Bemidji Fire Department trains annually with foam at the Bemidji Airport. Training with Class B foam ceased at the ERTC in 1996, and Class B foam training by the Richfield Fire Department stopped in 1999. 3M-brand Class B foam was used, or was likely used, at all three sites.

Class B foam manufactured by 3M was used, or was likely used (based on the date of foam use and the popularity of the foam) at all of the sites sampled as part of this project, except for the following: the ABLE fire training center in Burnsville; the fire foam training areas in Luverne and Harmony; the River Grove Marina fire; and, the storm sewer associated with the Goodview Fire Station. While PFOS is associated with 3M-brand foam, PFOS was detected in the soil at the sites in Burnsville, Luverne and Goodview. However, the PFOS detected in the storm water sediment sample collected in Goodview may or may not be associated with foam use at the Goodview Fire Station since storm water runoff is collected from numerous points along the storm sewer. Ansul-brand foam was used for training at the Burnsville site, however, the Burnsville Assistant Fire Chief indicated that the use of 3M-brand foam cannot be absolutely ruled out. The Harmony Fire Department indicated they train with Ansul-brand foam. The brand of foam used at the Luverne site for demonstration is unknown.

Analytical data for all of the soil and sediment samples indicates that perfluorinated sulfonates, especially PFOS, are present at higher concentrations than perfluorinated carboxylic acids. PFOS was the PFC

compound detected most often in the soil/sediment samples, with PFOS detected in 45 of the 80 samples analyzed. The next most-detected compounds were PFHxS and PFOA, which were detected in 36 of the soil/sediment samples. These trends are illustrated in **Graph 1**, ***Soil and Sediment PFC Concentrations***.

For the purpose of analyzing PFC concentrations trends with depth and with elapsed time between the last foam use and sampling date, PFOS soil concentration data were compared from the fire foam training sites where 3M-brand foam was used. This included PFOS data from foam training sites in Bemidji, Claremont, Rochester, Richfield, and Fridley. No trends were apparent in analyzing PFOS concentrations at shallow (0 to 4 feet bgs) and deep (4 to 8 feet bgs) depths, and no trends were apparent in comparing PFOS concentrations, and PFOS concentration increases/decreases with depth, to the length of elapsed time between the sampling and the last foam training. This lack of data trend may be due to the varying amounts of foam and water used, and different types of soils, and bare soil or grassy training sites versus paved training areas.

No trends are apparent between PFC compound concentrations and TOC concentrations. As expected, TOC concentrations are higher in the shallower soil samples.

6.2 Soil Laboratory Results versus State PFC Soil Reference Values

The MDH has defined soil reference values (SRVs) for a number of chemical compounds, which are soil contaminant concentrations above which an unacceptable risk to human health is predicted, dependent upon different exposure scenarios. The SRVs may or may not apply to the foam training areas or the fire sites; they are presented in this report for comparison purposes only.

Tier 1 SRVs assume that human exposure to contaminants is chronic and occurs in a residential site setting. Tier 2 SRVs assume contaminant exposures for industrial and recreational property uses. The MPCA has defined soil Tier 1 Residential SRVs, Tier 2 Recreational SRVs, and Tier 2 Industrial SRVs for only the following PFC compounds:

	Tier 1 Residential SRV	*Tier 2 Recreational SRV*	*Tier 2 Industrial SRV*
PFOS	2,100 ng/g	2,600 ng/g	14,000 ng/g
PFOA	2,100 ng/g	2,500 ng/g	13,000 ng/g
PFBA	77,000 ng/g	94,000 ng/g	500,000 ng/g

ng/g: nanograms per gram, which is equivalent to parts-per-billion.

None of the PFC concentrations detected in soil or sediment samples collected for this project met or exceeded any of the MPCA SRVs.

6.3 Groundwater and Surface Water Sampling Results

Laboratory analysis detected PFCs in 68 of the 72 groundwater and surface water samples analyzed for this project (see **Table 5**). Groundwater or surface water samples with the highest PFOS concentrations were found in samples collected at the WAFTA site. Water samples with the highest PFOA concentrations were collected at MSP Airport, WAFTA, and Duluth International Airport. Class B foams made by 3M were used, or were likely used based on the date of foam use, at all of these sites in the past.

The PFC compounds most often detected in groundwater and surface water samples were perfluorinated carboxylic acids. PFOA was detected in 59 of the 72 water samples collected during this project, and PFBA was detected in 58 water samples. PFHxA and PFPeA were detected in 55 and 53 of the water samples, respectively. This trend is illustrated in **Graph 2**, ***Groundwater and Surface Water PFC Concentrations.***

PFCs were detected in surface waters near the following fire foam training areas or fire sites where Class B foam was used: Richfield; MSP Airport; Goodview; River Grove Marina; Lake Superior College ERTC; Kings Cove Marina; and Up North Plastics. With the exception of Lake Superior College ERTC, the sampled bodies of water receive storm water runoff from areas other than the foam training or foam discharge sites. The PFCs detected in the surface waters may be attributed to the firefighting foam, or they may be from an unidentified source. At the ERTC in Duluth, it appears that only runoff from the fire training area enters that wetland.

At sites where 3M-brand foam were not used (the ABLE fire training center in Burnsville; the fire foam training areas in Luverne and Harmony; and, the storm sewer associated with the Goodview Fire Station), PFOS was detected in the groundwater or surface water. As discussed in Section 2.2, PFOS is associated with firefighting foams made by 3M. The source of PFOS at the ABLE fire training center in Burnsville, and at the training areas in Luverne and Harmony, is not known. The storm sewer outlet sampled in Goodview collects storm water from a large area where other sources of PFOS may exist.

6.4 Groundwater PFC Concentrations Versus Minnesota HRLs

The MDH has defined drinking water standards or values for the following PFC compounds: PFOS, PFOA, PFBA, and PFBS. The State drinking water Health Risk Limit (HRL) for both PFOS and PFOA in drinking water is 300 nanograms per liter (ng/L), which is equivalent to parts-per-trillion. The chronic exposure Health Based Value (HBV) for both PFBA and PFBS is 7,000 ng/L. The HBVs are developed by the MDH as interim guidance until a HRL can be established. A Risk Assessment Advice (RAA) for perfluorohexane sulfonate (PFHxS) does not specify numerical health-based limits or values.

The PFOS HRL was exceeded in at least one groundwater sample collected from the following sites:

- WAFTA

- Marathon Refinery
- Bemidji Airport
- ABLE fire training center in Burnsville
- MSP Airport

The PFOA HRL was exceeded in at least one groundwater sample collected from the following sites:

- MSP Airport
- WAFTA
- Duluth Airport
- ABLE fire training center in Burnsville
- Richfield Ice Arena

The surface water sample collected from the on-site wetland at the Lake Superior College ERTC had PFOS and PFOA concentrations that exceeded the drinking water HRLs. The HBVs for PFBA and PFBS were not exceeded in any of the water samples collected during this project.

6.5 State Surface Water Criteria for PFCs

The MPCA has developed site-specific ambient surface water quality criteria for only two PFC compounds, PFOA and PFOS. PFOA and PFOS criteria haven been developed for the surface waters of Lake Calhoun and for a portion of the Mississippi River, in accordance with Minnesota Rules, Chapter 7050.0218, *Methods for Determination of Criteria for Toxic Pollutants, for which Numerical Standards Not Promulgated.* Ambient surface water quality criteria have not been developed for any of the surface water bodies sampled as part of this project.

6.6 Ambient Groundwater Concentrations in Minnesota

In October 2007, ambient groundwater samples were collected by the MPCA from springs and monitoring wells in rural Minnesota for analysis of thirteen PFC compounds, including PFOA and PFOS. Sampling data is presented in the MPCA document *PFCs in Minnesota's Ambient Environment: 2008 Progress Report.* Twenty-two groundwater samples were analyzed for PFCs. The only PFC compound detected was PFBA, which was detected in thirteen samples at concentrations ranging from 2.43 ng/l to 63 ng/l.

In November-December 2006 and November 2007, the MPCA collected twenty-six ambient groundwater samples in urban areas of Minnesota, excluding those in Washington County where PFCs in groundwater are linked releases at historic 3M dumps. The samples were analyzed for nine PFC compounds, including PFOA and PFOS. Every PFC analyte was detected in at least one groundwater sample. Detected PFBA concentrations ranged from 1.34 ng/l to 468 ng/l. PFOA concentrations ranged from 1.1 ng/l to 24.8 ng/l. PFOS concentrations ranged from 2.39 ng/l to 31 ng/l.

In comparing groundwater sampling results from those sites sampled during this project in the rural areas of Minnesota (Harmony, Luverne, Bemidji, and Kandiyohi County) the PFBA concentrations as well as the number of other PFC analytes detected were considered. The PFC concentrations detected in groundwater at the firefighting foam training sites in Harmony, Luverne and Bemidji cannot be attributed to ambient concentrations. At the Kandiyohi County Landfill, where only low levels of PFBA have been detected in the well sample collected downgradient of the site of the fire, the PFBA concentrations may or may not be due to ambient levels.

Ambient concentrations of PFBA, PFOA and PFOS in groundwater found at urban locations were compared to the data collected at the remaining firefighting training sites or fire sites. The PFC concentrations detected in groundwater at the sites in Richfield, Fridley, Burnsville, and at MSP Airport, Duluth Airport, WAFTA, Marathon Refinery, and MW-3 at the Flint Hills Resources Pine Bend Refinery cannot be attributed to ambient concentrations. The PFBA, PFOA and PFOS concentrations detected in groundwater samples collected at the North St. Paul training area and the Crystal Airport, and in the upgradient groundwater samples (B-5, B-6 and B-7) at MSP Airport and the upgradient sample (MW-1) at the Pine Bend Refinery may or may not be due to ambient levels.

7.0 RECEPTOR SURVEYS AND ASSESSMENT OF RISK

The execution of receptor surveys and an evaluation of potential risks associated with PFC impacts identified during this project was not part of the scope of work, with one exception: a water well receptor survey was conducted around the former firefighting foam training area in Richfield due to the known presence of private wells in the area (see Section 7.2). The MPCA is not aware of anyone drinking water that has been impacted with PFCs above drinking water criteria due to the use of firefighting foam. The chemicals associated with firefighting foams of most concern at this time are PFOS and PFOA. According to the Minnesota Department of Health, nearly all people have some amount of PFCs in their blood. Studies by the Center for Disease Control and Prevention (CDC) published in 2007 found that PFOS, PFOA and PFHxS were detected in approximately 98% of the population (18). Research relied upon by the MDH in setting HRLs for drinking water indicates the health concerns associated with exposure to PFOS are effects on the liver and thyroid; health concerns related to PFOA are effects on the liver, slowed development in fetuses, reduced number of red blood cells, and changes to the immune system (19). While less is known about the potential health effects of telomerized compounds, the fact that they are showing up in more locations where firefighting foams are being used may mean that more study is warranted.

7.1 MDH Municipal Well Sampling

One of the risks associated with PFCs in groundwater is to human health should a potable water well be drawing water from impacted groundwater. There are municipal supply wells located near several of the "priority" sites where groundwater impacted by PFCs have been identified, including Bemidji, Luverne, Burnsville, and Richfield. The MPCA and MDH have worked together to identify public supply wells that may be at risk due to their proximity to firefighting foam training areas or large fire sites where Class B foam was discharged. The MDH has sampled supply wells near several fire foam training areas in the "priority" cities and elsewhere, and while low levels of some PFC compounds were detected in municipal well water samples, none of the concentrations have exceeded the HRLs or HBVs.

7.2 Well Receptor Survey, Richfield

As presented in the February 2010 Report, a water well survey was conducted in the area adjacent to or within one-quarter mile to the east, south and southeast of, the former Richfield fire foam training area at the Richfield Ice Arena, in reference to the easterly or potential southeasterly groundwater flow direction. The survey included a search of the MDH County Well Index (CWI), and walking and mailing surveys to identify private water wells. The survey identified several sealed and abandoned water supply wells and groundwater monitoring wells in the survey area. No active wells, other than the municipal wells which were being sampled by MDH, were identified within ¼-mile downgradient of the former fire training area.

7.3 Well Receptor Survey, WAFTA

A groundwater receptor survey conducted by ENSR Corporation identified several water supply wells within one-half mile of the WAFTA site. Sampling of the nearby water wells by the MPCA in 2008 and 2009 did not identify PFCs in any of the wells.

7.4 Well Information, Duluth International Airport

According to the *Groundwater Sampling Report* by BB&E, LLC, there are no drinking water wells in the immediate area of the former firefighting foam training areas, and there are no plans to install water supply wells on airport property. The nearest residential water supply wells identified in a groundwater receptor survey conducted in association with this site are located approximately 1.25 miles away. The residential wells are currently being sampled for PFCs under the oversight of the MPCA.

8.0 FINDINGS AND RECOMMENDATIONS

8.1 PFCs in Class B Foam

Based on the literature review, interviews with knowledgeable persons, and survey of firefighting foam manufactures, the surfactant in Class B firefighting foams contain PFCs. The Class B foams manufactured by 3M prior to 2002 using the ECF manufacturing process contain, or break down to, perfluorinated

sulfonates. Class B foams made by other manufacturers using a telomerization process contain, or break down to, fluorotelomer sulfonates and perfluorinated carboxylic acids.

8.2 Class B Foam Use in Minnesota

Based on the survey of Minnesota firefighting organizations, and assuming that the 66% response rate by municipal fire departments is representative of the entire State, approximately 10% of the municipal fire departments do not use firefighting foam at all, approximately 58% of the municipal fire departments use only Class A foams, approximately 15% of the municipal fire departments use Class B foam for fire response but do not train with Class B foam, and approximately 15% of the municipal fire departments use and train with Class B foam.

The two active oil refineries in the State have their own fire departments and their own on-site fire training areas where Class B foam is used in training and as needed for extinguishing fires.

Of the sixteen MNSCU firefighting training schools, only two of the schools hold training exercises or held training exercises on campus with Class B foam: Lake Superior College ERTC in Duluth; and, Northland College in East Grand Forks.

Firefighting training with Class B foam is no longer conducted at MSP Airport or the Duluth International Airport. Training at these airports with 3M-brand Class B foam was conducted in the past.

Firefighting training with Class B foam at the WAFTA site in St. Bonifacius ceased in 1990. Firefighting foam is not used in training exercises at the SCALE Regional Public Safety Training Facility in Jordan, which opened in 2008. Firefighting foam training is not conducted at Camp Ripley.

Class B foams have been used, and will continue to be used on Class B fires across the State in order to protect public safety, the safety of firefighters, and property. Class B foams are not classified as a hazardous substance, nor has the MPCA or other regulatory entity placed any restrictions on the use of Class B foams.

8.3 Sampling Findings

This project has identified PFCs in soil, sediments, surface water and groundwater at locations where various brands of Class B firefighting foams were used. PFCs were found in soils and groundwater at sites where several years have passed since the last training event or since foam was discharged at a fire. PFC compounds associated with 3M's ECF manufacturing process (i.e. perfluorinated sulfonates) were detected at training sites where 3M-brand foams were not used.

Groundwater is impacted with PFOA and/or PFOS at concentrations exceeding the State drinking water HRLs at the following sites:

- WAFTA site in St. Bonifacius
- Marathon Refinery in St. Paul Park
- Bemidji Regional Airport
- ABLE fire training center in Burnsville
- MSP Airport
- Duluth International Airport
- Richfield Ice Arena

While these locations have PFOA and/or PFOS concentrations in groundwater that exceed the State drinking water Criteria, at this time the MPCA is not aware of anyone drinking water contaminated with PFCs due to the use of firefighting foams that exceed drinking water criteria. Sampling of private water wells in the area of the WAFTA and Duluth International Airport firefighting foam training sites did not detect PFCs in any of the wells. A groundwater receptor survey conducted in the area of the Richfield Ice Arena did not identify any active private water wells.

The PFC concentrations in soils at all sites where samples were collected are all well below the current clean-up criteria.

Firefighting foam training sites with minimal use of Class B foams exhibited low levels of PFCs in groundwater, but concentrations are not exceeding current standards. Therefore, those training sites ranked lower than the 21 "priority" sites do not appear to be a risk to human health or the environment and will not be subject to further action at this time, unless additional information is obtained that would change the ranking of a site.

8.4 State Recommendations on the Use of Class B Firefighting Foam

The MPCA, in conjunction with the Minnesota Department of Public Safety and the Minnesota State Colleges and Universities, has prepared a "Best Practices Today for Class B Firefighting Foam" document, a copy of which is included in **Appendix A**. The Best Practices document recognizes the importance of the use of Class B firefighting foam to fight Class B fires-- it protects the public, it protects the firefighters working to protect us, and it protects property. The Best Practice document presents information and recommendations on the use of foam on fires and spills, foam training, foam types, firefighters' health, and foam disposal, and includes the following recommendations:

- Use Class B foams as necessary on Class B fires, but use Class A foams for Class A fires.
- Use training foam, and not Class B foam, in training exercises if possible. Training foams do not appear to contain PFCs.
- Training with Class B foams in wellhead protection areas or near public or private water supply wells should be avoided whenever possible.

8.5 Recommendations for Further Assessment

While the MPCA is not aware of anyone drinking water contaminated with PFCs above drinking water criteria associated with firefighting foam use, several sites still warrant some additional investigation. Based on the information presented in this report and previous reports, following are recommendations for further assessment with regards to PFCs at firefighting foam training sites or fire sites where Class B foam was used:

1. Conduct groundwater receptor surveys to evaluate risk at the following sites where PFOA and/or PFOS concentrations in groundwater exceeded the State HRLs:
    - Marathon Refinery in St. Paul Park
    - Bemidji Regional Airport
    - ABLE fire training center in Burnsville
    - MSP Airport
2. Conduct a groundwater receptor survey to evaluate risk in the area of the Lake Superior College ERTC due to elevated PFOS and PFOA concentrations in the wetland adjacent to the training area.
3. Continue to monitor groundwater for PFCs at the existing monitoring well located downgradient of the fire site at the Kandiyohi County Landfill. Since the foam discharge occurred less than one year ago, it may take time for potential PFC impacts to migrate through the soil to the water table, and to migrate with groundwater to the location of well DMW-3. Consider installing a monitoring well closer to the site of the fire if site activities and land use nearer the fire site are conducive to the presence of a monitoring well.
4. At the time of sampling at Crystal Airport, there was no water in Shingle Creek. Since PFCs were detected in a sediment sample collected on the down stream side of Crystal Airport, but none were detected upstream, water samples should be collected at or near the locations of the previous sediment samples to test for PFCs in Shingle Creek adjacent to Crystal Airport.
5. Follow up with inquiries, and sampling if warranted, at any large fires that occur or have occurred where Class B foams are used extensively.

9.0 REMARKS

The recommendations contained in this report represent Delta's professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Delta and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Delta's client and anyone else specifically identified in writing by Delta as a user of this report. Delta will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Delta makes no express or implied warranty as to the contents of this report.

CLASS B FOAM USE RANKING SUMMARY
MINNESOTA MUNICIPAL FIRE DEPARTMENTS
Delta Project No. 19382DEL08

		SITE RANKING CRITERIA								
Department	**Training Location**	**Foam Type: 3M current or former use in training =8**	**Annual Class B Foam Usage in Training: 5 gal or less=2; 6 to 10 gal=4; >10 gal=6**	**Surface Water Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Wetlands Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Karst Area: Active=5; Transition=4; Covered=2; No=0**	**Water Wells Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**WPA/SWAA: site in WPA and/or SWAA=5; within 1/4 mile=4; within 1 mile=2; No=0**	**OVERALL SITE RANKING**	**Notes**
Richfield	Richfield ice arena, 636 E. 66th St.	8	6	3	3	2	3	5	30	sampled soil, groundwater, surface water, upgradient groundwater
Fridley	300 71st Av., Fridley (North Metro Fire Training Center)	8	2	3	3	4	3	5	28	sampled soil, groundwater, sediment
Luverne	Tree dump 1/2 mile south of city on Hwy 75, east side of road.	8	6	3	3	0	3	5	28	sampled soil, groundwater
North St. Paul	No. St. Paul Public Works, 2303 1st St. N.	8	6	3	1	2	3	5	28	sampled soil, groundwater, surface water
Brooklyn Center	Fire station #1 6250 Brooklyn Blvd.	8[(a)]	6	1	1	4	3	5	28	follow-up site visit indicated no Class B foam training.
	Fire station #2 6500 Dupont Av. N.	8[(a)]	6	1	1	4	3	5	28	follow-up site visit indicated no Class B foam training.
Preston	Fillmore County Fairgrounds Fillmore St. & Cty. Hwy. 12, Preston	8	2	3	3	5	3	4	28	follow-up interview indicated one-time training at specified location only.
Kenyon	Fire station, 714 2nd St.	8	2	3	1	5	3	5	27	sampled soil
Cottage Grove	Fire Station 2, 8641 80th St. S.	8	2	3	3	5	1	5	27	follow-up interview indicated training with Class A foam only.
Bemidji	Bemidji Airport (Class B)	8	4	3	3	0	3	5	26	follow-up interview indicated foam brand unknown; sampled soil, groundwater
Northfield	City street shop, 1710 Riverview Drive.	8	2	3	3	5	3	1	25	haven't trained with foam in 10-15 years, and only trained when new equipment purchased.
Rochester	2021 41st St. NW	8	2	1	1	5	3	5	25	sampled soil
Burnsville	ABLE Fire Training Center Cliff Rd & River Ridge Blvd.	0	4	3	3	5	3	5	23	sampled soil, groundwater
Claremont	Front of fire hall on Front St.	8	2	1	0	4	3	5	23	sampled soil
Clearbrook	Tank farm on south edge of town.	8[(a)]	4	3	3	0	3	2	23	Fire Chief wasn't sure the type of foam used. Spent foam caught on floating lids at tank farm.
Linwood Twp	Behind fire station, 22870 Typo Creek Dr., Stacy	8	4	3	3	0	3	2	23	
Littlefork	Fire hall, McPherson & 3rd Av	8[(a)]	2	3	3	0	3	4	23	follow-up attempts unsuccessful
St. Clair	City of St. Clair	8[(a)]	6	3	1	2	3	0	23	follow-up attempts unsuccessful
Alexandria	Various, including VoTech, Magellan tank farm, live burns.	8[a]	2	3	1	0	3	5	22	historical training with Class B foam at Magellen tank farm only.
Golden Valley	7800 Golden Valley Road	0	6	3	1	4	3	5	22	
Hutchinson	205 3rd Av. SE	8	4	1	1	0	3	5	22	no on-site foam training, historically trained with foam at 3M facility in town.
	1300 Adams St. SE	8	4	3	1	0	3	2	21

Entity	**Location**	**Training Location**	**Notes**	**Foam Type: 3M current or former use in training=8**	**Annual Class B Foam Usage in Training: 5 gal or less=2; 6 to 10 gal=4; >10 gal=6**	**Surface Water Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Wetlands Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Karst Area: Active=5; Transition=4; Covered=2; No=0**	**Water Wells Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**WPA/SWAA: site in WPA and/or SWAA=5; within 1/4 mile=4; within 1 mile=2; No=0**	**Site Ranking**
Alexandria Technical College	1601 Jefferson St. Alexandria	Various locations	Foam provided by various fire departments.	Foam training at various locations, foam provided by other fire departments. Site not ranked.							
Central Lakes College	501 W. College Drive, Brainerd	Various fire departments		Multiple training locations, site not ranked.							
Hennepin Technical College	13100 Collegeview Dr. Eden Prairie	Parking lots of school		Use of Class A and training foam only; no Class B foam use. Site not ranked.							
Hennepin Technical College	1820 Xenium Ln. N. Plymouth	Hennepin Technical College, 13100 College View Dr., Eden Prairie		Class A foam use only, site not ranked.							
Itasca Community College	1831 E. Hwy. 169 Grand Rapids	Not applicable		Foam not used in training, site not ranked.							
Lake Superior College	11501 Hwy 23 Duluth	On-site	Training foam type Kidde Trainol. Other departments train with Trainol.	8	2	3	3	0	1	0	17
Mesabi Range College	1001 Chestnut St. Virginia	Various fire departments and on-site.		Class A foam use only, site not ranked.							
Minnesota State Community & Technical College	2900 28th Av. S. Moorhead	Various fire departments; no training with foam on campus.	Foams supplied by local fire departments.	Multiple training locations, site not ranked.							
Minnesota West Comm & Tech College	607 W. Main St., #100 Marshall	Various fire departments: Granite Falls, Luverne, Jackson, Lake Wilson, and Merit Center in Marshall	Training foam type unknown.	Multiple training locations, site not ranked.							
Northland College	1101 Hwy 1 East Thief River Falls	Various fire departments	Foam training done at off-site locations using other departments' foam.	Class A foam use only, multiple training locations; site not ranked.							
Northland College	2022 Central Av. NE East Grand Forks	Two grassy areas and a parking lot on campus.	Stopped using Class B protein foam more than 5 years ago.	0	6	1	1	0	0	0	8
Pine Technical College	900 4th St. SE Pine City	Various house burns, training as requested.	Foam supplied by other fire departments.	Class A foam use only, multiple training locations; site not ranked.							

TABLE 2

CLASS B FOAM USE RANKING SUMMARY

MINNESOTA AIRPORT AND REFINERY FIRE DEPARTMENTS AND TRAINING SCHOOLS

Delta Project No. 19382DEL08

Entity	Location	Training Location	Notes	Site Ranking Criteria							Site Ranking
				Foam Type: 3M current or former use in training=8	Annual Class B Foam Usage in Training: 5 gal or less=2; 6 to 10 gal=4; >10 gal=6	Surface Water Nearby: within 1/4 mile=3; within 1 mile=1; No=0	Wetlands Nearby: within 1/4 mile=3; within 1 mile=1; No=0	Karst Area: Active=5; Transition=4; Covered=2; No=0	Water Wells Nearby: within 1/4 mile=3; within 1 mile=1; No=0	WPA/SWAA: site in WPA and/or SWAA=5; within 1/4 mile=4; within 1 mile=2; No=0	
St. Cloud Technical College	1540 Northway Drive St. Cloud	Various fire departments		Multiple training locations, site not ranked.							
South Central College	1920 Lee Blvd North Mankato	On-site (10%) and at various fire departments (90%).	Training with various foam brands, whatever the trainee dept. has on hand and whatever is least expensive.	es that there is no on-site training with Class B foam.							
Ridgewater College	2101 NW 15th Av Willmar	Off-site at various fire departments: Litchfield, Ortonville, Prinsburg, Morris		Class A foam use only, multiple training locations; site not ranked.							
Riverland Community College	1900 8th Av NW Austin	Have not trained in many years, recall one training event in Preston, MN.	Foam brands not specified.	Class A and training foam use only, multiple training locations; site not ranked.							
Flint Hills Resources, Pine Bend Refinery Fire Dept.	Rosemount	SW corner of refinery site, 1255 Clayton Blvd.	3M Foams (FC 600F, FC 602, ATC 3x3, FC 603) no longer used for training. Ansul Thunderstorm FC600A used for training. Other departments train on site.	8	6	1	1	4	3	0	23
Marathon Petroleum Refinery	St. Paul Park	Refinery fire training grour	Switched from 3M to Ansul Thunderstorm foam in ~2000. Use ~250 gallon foam for training; non-training foam use varies. Site located in Special Well Construction Area.	8	6	3	3	5	3	2	30
Former Wrenshall Refinery	Highway 1, Wrenshall	Per Wrenshall Fire Chief, historic training with foam on-site.		8[(b)]	6[(c)]	3	3	0	3	2	25[(c)]
Camp Ripley	15000 Hwy 115 Little Falls	No on-site training with foam.	Class A foam type Fire-Trol Fire Foam 103B	No on-site training with foam, Class A foam use only; site not ranked.							

TABLE 2

CLASS B FOAM USE RANKING SUMMARY

MINNESOTA AIRPORT AND REFINERY FIRE DEPARTMENTS AND TRAINING SCHOOLS

Delta Project No. 19382DEL08

				Site Ranking Criteria							
Entity	**Location**	**Training Location**	**Notes**	**Foam Type: 3M current or former use in training=8**	**Annual Class B Foam Usage in Training: 5 gal or less=2; 6 to 10 gal=4; >10 gal=6**	**Surface Water Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Wetlands Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**Karst Area: Active=5; Transition=4; Covered=2; No=0**	**Water Wells Nearby: within 1/4 mile=3; within 1 mile=1; No=0**	**WPA/SWAA: site in WPA and/or SWAA=5; within 1/4 mile=4; within 1 mile=2; No=0**	**Site Ranking**
Metropolitan Airports Commission at Minneapolis/St. Paul Airport	MSP	Trained until recently at Humphrey remote ramp or de-icing pad. Plugged drains, collected spent foam for off-site disposal	Ansul 3% used for training. Historic use of military protein foam in 1960s/1970s. Historic use of 3M foam through ~2000. Class A foam type 1% Lorcon.	8	6	3	3	5	3	5	33
Rochester Airport Fire Dept.	Rochester	Various on-site locations as selected by FAA Inspector, usually a runway. "Short bursts" of foam required in training by FAA. Firefighters train at facility in Duluth.		0	2	3	3	5	3	0	16
Minnesota Air National Guard - Duluth International Airport	Duluth	No current on-site training with foam.	Active site investigation for PFCs at former fire training site under direction of MPCA. 3M foam still used in fire response.	8[(b)]	6	3	3	0	3	0	23

Notes:

(a) Foam type or training use not specified, 3M foam use for training assumed.

(b) 3M foam not currently used in training, but currently used in fire response. Site ranked based on use of foam in fire response.

(c) Ranking assumes maximum use of 3M foam in training exercises.

WPA: Wellhead Protection Area

SWAA: Source Water Assessment Area

Notes:

PFC results are in nanograms per gram (ng/g), which is equivalent to parts per billion.
PFC compounds soil results reported on a dry weight basis.
Bolded type indicates detection above the laboratory method detection limit.
Non-detect results presented as less than the laboratory detection limit.
Axys: Axys Analytical Services LTD
MPI: MPI Research
(1) Last training event prior to sampling, dates are approximate
(2) Results based on analysis of a dilution of the sample extract.

Notes:
All results and standards are in nanograms per liter (ng/L), which is equivalent to parts per trillion.
Axys: Axys Analytical Services LTD
MPI: MPI Research
MDH: Minnesota Department of Health Environmental Laboratory.
Exygen: Exygen Research
Bolded type indicates detection above the laboratory method detection limit.
Highlighted concentrations exceed the HBV or HRL.
(1) Last training event prior to sampling, dates are approximate
(2) Health-Based Value (HBV) for chronic exposure defined by the Minnesota Department of Health.
(3) Health Risk Limit (HRL) for drinking water defined by the Minnesota Department of Health.
(4) Risk Assessment Advise (RAA) set by the Minnesota Department of Health for PFHxS does not specify numeric values.
ND: No health-based limit defined.
(5) Manually Calculated Result is 18.9
(6) Manually Calculated Result is 17.1
(7) Manually Calculated Result is 23.3
(8) Manually Calculated Result is 21.7
(J) Analyte positively identified, result is below reporting limit and is estimated.
*Sample collected upgradient of fire foam training or discharge area, intended to act as "background" sample.
NA: Not analyzed

APPENDIX A

Best Practices Today for Class B Firefighting Foam

Best Practices Today for Class B Firefighting Foam

- Perfluorochemicals (PFCs) are a group of chemicals developed by 3M Corp for use in products to make them water repellent, stain-resistant, slippery and longer lasting.
- PFCs are not natural and do not seem to break down in the environment. Once in the environment, they may be taken up by living things, and build up (bioaccumulate) within the tissue of plants, animals and people.
- Scientists have been surprised to find PFCs in approximately 98% of all humans, including people in remote areas who have never had contact with the modern world. Studies in Minnesota have shown PFCs to be present in some ground and surface waters, air, soil and fish. Studies are underway to see if PFCs create health or developmental problems in people.
- PFCs are used in Class B firefighting foams to increase their effectiveness and make them long lasting.
- The Minnesota Pollution Control Agency (MPCA) is working on a study to understand the potential of firefighting foam as a source of PFCs in the environment. Soil and groundwater at approximately 20 firefighting training sites will be evaluated for PFCs. Minnesota Department of Health is sampling some municipal wells near foam training sites.
- Results from this work will be able late in 2009. MPCA, MnSCU Fire/EMS/Safety Center, and Fire Marshal's Office have developed guidelines for the training and use of Class B fire fighting foam until more answers on foam are known.

<u>Use of foam on fires and spills</u>

First, Class B firefighting foam has been a lifesaver. It is meant for flammable liquid fires and flammable liquid pools, or for combustible liquid fires. So use it if you have a flammable liquid like gasoline on fire or a big gasoline pool in a place where it could ignite or where it would do damage if it did ignite. Don't automatically use it for a diesel fuel spill, unless the diesel fuel is on fire or the situation is endangering life and property. Don't automatically blanket non-leaking flammable liquid tanks unless the situation really calls for it.

Second, don't use Class B foam on car fires, ordinary structure fires, wildland fires, or other inappropriate situations. Class A foams are meant for those situations, Class A foams are not thought to contain PFCs.

Foam training

Foam training sessions should include discussion of when foam use is necessary, when it can be helpful for safety, and when its use is inappropriate.

If possible, use training foams in training. Training foams are not thought to contain PFCs. Class B foam training should not be done near surface waters or storm sewer inlets which would allow foam to quickly drain to water.

PFCs can quickly pass through soil to groundwater. If your city has municipal wells your city water superintendent will have a map of the "well head protection area" which shows where the city's wells draw their water from. Training in those protection areas or in areas near private wells should be avoided. Train on soil where possible, and pick organic soils as opposed to sandy and gravelly soils if possible. That will increase the likelihood that PFCs in the foam are retained in the soil and don't quickly wash through to groundwater.

Foam types

There are many types of PFCs. Apparently all the AFFF type Class B foams have some PFC content of various types. Ethanol resistant AFFF foams apparently also contain types of PFCs. Class A foams are not thought to contain PFCs.

Firefighters' Health

Use foams to protect the public, your firefighters, and valuable property. There is no current concern that PFCs can enter firefighters' bodies by occasional skin contact or inhalation during firefighting or training.

Disposal

At this time the best disposal of Class B foams is to use it appropriately on Class B flammable liquid spills and fires. Liquids can't be put into the garbage. If Class B foam is sent down the sanitary sewer it will go to the city's wastewater treatment plant and the PFCs in the foam probably will pass straight on through to the river or lake without being broken down. So for now, the best advice is to store it safely where the containers won't get damaged until it gets used or until there are better disposal options available. That likely will be quite some time.

PERFLUOROCARBON (PFC)-CONTAINING FIREFIGHTING FOAMS AND THEIR USE IN MINNESOTA: SURVEY AND SAMPLING ACTIVITIES, STATE FISCAL YEAR 2011

1.0 INTRODUCTION

1.1 Purpose

Antea™ Group (formerly Delta Consultants) has worked under contract with the Minnesota Pollution Control Agency (MPCA) investigating perfluorochemicals in Class B firefighting foams and the use of Class B firefighting foams in Minnesota. Previous information regarding this investigation was presented in the following reports:

- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use In Firefighting Training in Minnesota, dated June 30, 2008 (the June 2008 Report);
- Addendum to PFC-Containing Firefighting Foams and Their Use In Firefighting Training in Minnesota, dated October 22, 2008 (the October 2008 Addendum Report);
- Firefighting Training Area Site Reconnaissance, Pine Bend Flint Hills Refinery, Marathon Refinery, Burnsville Fire Training Center, and Site Access for 21 Fire Departments, dated April 3, 2009 (the April 2009 Report);
- Report of Site Reconnaissance and Sampling at Select Firefighting Foam Training Areas in Minnesota, dated June 30, 2009 (the June 2009 Report);
- Report of Investigation Activities at Select Firefighting Foam Training Areas and Foam Discharge Sites in Minnesota, dated February 10, 2010 (the February 2010 Report);
- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use in Firefighting Training in Minnesota, dated June 30, 2010 (the June 2010 Report);
- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use in Minnesota: Well Receptor Surveys and Follow-Up Sampling at Select Sites, dated November 15, 2010 (the November 2010 Report);
- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use in Minnesota: Sampling at the Lake Superior College Emergency Response Training Center, Duluth, dated February 25, 2011 (the February 2011 Report); and,
- Perfluorocarbon (PFC)-Containing Firefighting Foams and Their Use in Minnesota: Sampling at the Hidden Harbor Marina, Burnsville Wetland, and Bemidji Private Wells dated May 13, 2011 (the May 2011 Report).

This report summarizes data and information for activities conducted for the "PFC/Firefighting Foam" project during the Minnesota State Fiscal Year of 2011.

1.2 Background

As a part of an overall investigation of PFCs in Minnesota, the MPCA and Minnesota Department of Health (MDH) have been investigating firefighting foams as a possible source of PFCs in the environment. Aqueous film-forming foam, or Class B AFFF, has a fluorochemical-based surfactant that rapidly forms a film across the fire surface, which prevents the release of flammable fuel vapors and excludes oxygen from the fuel surface. PFCs have been identified in soil,

sediment, surface water and groundwater samples collected from locations in Minnesota where various brands of Class B AFFF have been used repeatedly in training exercises or in large quantity to extinguish fires.

Municipal fire departments, fire departments at major oil refineries and airports in Minnesota, fire training schools in the State, and other knowledgeable persons were surveyed and interviewed regarding their use and knowledge of firefighting foams. Firefighting training sites and fire sites where Class B AFFF is or was used were ranked for their potential to release PFCs to the environment based on a number of criteria, including the following: the types and amounts of foam used, the frequency of the training events, the environmental setting of the site, and the presence of nearby receptors such as water supply wells and surface waters. The results of the survey and site ranking were presented in the June 2008 Report and October 2008 Addendum Report. Both reports are available on the MPCA website at www.pca.state.mn.us/cleanup/pfc/index.html.

Based on the site ranking, a number of firefighting training sites and fire sites where Class B AFFF was discharged were selected for further investigation. Additional investigation activities included site reconnaissance, in-depth interviews with knowledgeable persons, and/or sampling of potentially affected media including groundwater, soil, surface water and/or sediments. Information and data collected at these select sites were documented in the April 2009, June 2009, February 2010, June 2010, November 2010, February 2011 and May 2011 Reports. These reports are also available on the MPCA website. The investigation activities found that PFCs are present in the environment (soil, groundwater, surface water and/or sediment) at sites where Class B AFFF was discharged repeatedly in training exercises or where large amounts of Class B foam were utilized on Class B fires. The investigations have also identified PFCs in surface water or groundwater at concentrations above the State Health Risk Limits (HRLs) for drinking water at the following sites:

- a former firefighting training area behind the Richfield Ice Arena in Richfield;
- two former firefighting training areas at Minneapolis-St. Paul International (MSP) Airport;
- a firefighting training area at the Marathon Refinery in St. Paul Park;
- the Apple Valley-Burnsville-Lakeville-Eagan (ABLE) Training Center in Burnsville;
- a firefighting training area at the Bemidji Regional Airport; and,
- a firefighting training area at the Lake Superior College Emergency Response Training Center (ERTC) in Duluth.

PFC concentrations above the HRLs in groundwater were also identified by environmental consultants other than Antea Group at a former firefighting training area at the Duluth International Airport and at the Western Area Fire Training Academy (WAFTA) in St. Bonifacius. Sampling results for these sites are presented briefly in the June 2010 Report.

Laboratory results for all PFC sampling conducted in association with this PFC/Firefighting Foam project are summarized in **Table 1, *Groundwater and Surface Water PFC Analytical Results***, and **Table 2, *Soil and Sediment Analytical Results, PFCs and TOC (Total Organic Carbon)***.

One of the risks associated with PFCs in groundwater is to human health should a potable water well be drawing water from an impacted groundwater aquifer. The MPCA and MDH have worked together to identify public supply wells that may be at risk due to their proximity to firefighting foam training areas or large fire sites where Class B AFFF was discharged. The MDH has sampled water supply wells near several fire foam training areas and while low levels of some PFC compounds were detected in municipal well water samples, none of the water samples had PFC concentrations higher than the HRLs or State Health-Based Values (HBVs). Groundwater sampling conducted by the MDH is discussed briefly in the June 2010 Report.

Based on the presence of PFCs at levels above the HRLs in groundwater at the former firefighting training area in Richfield and the known presence of private water supply wells in the area, a receptor survey was conducted in the vicinity of the former training area in order to identify potential receptors of impacted groundwater. The survey identified several sealed and abandoned water supply wells and groundwater monitoring wells in the survey area, but no active water supply wells other than the municipal wells which were being sampled by MDH. Results of the receptor survey for the former firefighting training area in Richfield are presented in the February 2010 Report. Receptor survey results for the Duluth International Airport and the WAFTA site in St. Bonifacius are also briefly presented in the June 2010 Report.

In 2006 and 2007 a number of groundwater samples collected by the MPCA from multiple rural and urban locations in Minnesota were analyzed for PFCs as part of a State-wide monitoring effort of PFCs in the ambient environment. The results of that sampling and a comparison of groundwater data collected as part of the ambient sampling and the sampling done as part of the PFCs/Firefighting Foam project were presented in the June 2010 Report. Ambient sampling data is presented in the MPCA document *PFCs in Minnesota's Ambient Environment: 2008 Progress Report.*

At the end of the State Fiscal Year 2010, the following recommendations for additional work for the PFC/Firefighting Foam project were made in the June 2010 Report:

1. Conduct groundwater receptor surveys to evaluate risk at the following sites where PFOA and/or PFOS concentrations in groundwater exceeded the State HRLs:
    - Marathon Refinery in St. Paul Park
    - Bemidji Regional Airport
    - ABLE Training Center in Burnsville
    - Minneapolis-St. Paul International Airport (MSP)
2. Conduct a groundwater receptor survey to evaluate risk in the area of the Lake Superior College ERTC due to elevated PFOS and PFOA concentrations in the wetland adjacent to the training area.

3. Continue to monitor groundwater for PFCs at the existing monitoring well located downgradient of the fire site at the Kandiyohi County Landfill. Since the foam discharge occurred less than one year ago, it may take time for potential PFC impacts to migrate through the soil to the water table, and to migrate with groundwater to the location of monitoring well DMW-3. Consider installing a monitoring well closer to the site of the fire if site activities and land use nearer the fire site are conducive to the presence of a monitoring well.
4. At the time of sampling at Crystal Airport in January 2010, there was no water in Shingle Creek. Since PFCs were detected in a sediment sample collected on the downstream side of Crystal Airport, but none were detected in an upstream sediment sample, water samples should be collected at or near the locations of the previous sediment samples to test for PFCs in Shingle Creek adjacent to Crystal Airport.
5. Follow up with inquiries, and sampling if warranted, at any large fires that occur or have occurred where Class B AFFF is used extensively.

2.0 SCOPES OF WORK CONDUCTED IN STATE FISCAL YEAR 2011

As a result of finding PFCs at concentrations above the HRLs in groundwater or surface water at the sites identified in Section 1.2, receptor surveys were conducted in the vicinities of these sites in Fiscal Year 2011, except for the former firefighting training area in Richfield where a receptor survey was conducted in Fiscal Year 2010. The purpose of the receptor surveys was to identify potential receptors of PFC-impacted groundwater or surface water. Based on results of the receptor surveys, private wells near the Marathon Refinery, Bemidji Regional Airport, and Lake Superior College ERTC, and surficial water bodies near Lake Superior College ERTC and the ABLE Training Center, were sampled for PFCs.

Additional follow-up PFC sampling was also conducted in Fiscal Year 2011 at two sites: (1) groundwater samples were collected from two existing monitoring wells at the Kandiyohi County Landfill, where Class B AFFF was used on a fire in October 2009; and, (2) surface water and sediment samples were collected from Shingle Creek, adjacent to Crystal Airport.

2.1 Work Order SFDE1107-2

To address the recommendations included in the June 2010 Report, Antea Group performed the following scope of work under MPCA Work Order SFDE1107-2, dated July 23, 2010:

1. Conducted groundwater receptor surveys in the vicinity of current or former firefighting training sites at the following locations: Marathon Refinery in St. Paul Park; Bemidji Regional Airport; ABLE Training Center in Burnsville; MSP Airport; and, Lake Superior College ERTC in Duluth.
2. Conducted additional groundwater sampling from two existing wells at the Kandiyohi Landfill.
3. Conducted additional sediment and surface water sampling at Shingle Creek adjacent to the Crystal Airport in Crystal.

4. Prepared a report summarizing work performed as part of the scope of work (the November 2010 Report).

2.1.1 Groundwater Receptor Surveys

Groundwater receptor surveys conducted in the vicinity of the current or former firefighting training sites identified in Section 2.1 included the following activities:

- Walking surveys were conducted in order to identify all houses and businesses, surface water bodies, water wells, and any other features that may be a groundwater receptor. The walking surveys included the area within 500 feet upgradient and side-gradient of the sites and 1/2-mile downgradient of the sites. Hydrological resources used in determine groundwater flow directions at each of the sites are presented in the November 2010 Report.
- Information regarding the potable water source and water wells at the properties identified during the walking surveys was obtained from property owners or tenants. Information was obtained through personal interviews or via well survey questionnaires that were either left at a property or sent in the mail.
- Inquiries were made as necessary with the water supply utility regarding municipal water sources, municipal well locations, and the availability of municipal water in the area of the sites.
- The MDH County Well Index (CWI) was searched in order to identify registered water wells located within the survey areas.

Details and results for each of the receptor surveys are presented in the November 2010 Report. The November 2010 Report included references Findings of the surveys are summarized in **Table 3, *Well Receptor Summary for Select Firefighting Foam Training Sites in Minnesota***. The receptor surveys identified the following potential groundwater receptors:

- Marathon Refinery: As presented in the November 2010 Report, the inferred groundwater flow direction is generally to the southwest. An April 2008 groundwater elevation contour map prepared by URS in association with a petroleum release at the Marathon Refinery (unrelated to the firefighting foam area at the refinery) indicated a slightly more southerly groundwater flow direction at the southeast portion of the refinery property. Thus the receptor survey performed for this PFC/Firefighting Foam project included an area within 1/2-mile to the south and southwest of the firefighting training area at the refinery. A figure showing the October 2010 receptor survey area, inferred groundwater flow directions, returned well survey questionnaires, and a MDH CWI map of wells in the survey area and associated well logs are included as **Appendix A**.

  Of the eleven wells shown on the CWI map in the receptor survey area, eight are either monitoring wells, remedial wells, or abandoned wells. The remaining three wells mapped by the CWI, Unique Well nos.

441942, 576171, and 429870, are domestic wells registered to Willie Brown or Willie's Hidden Harbor. The well questionnaire survey identified five active water supply wells at or owned by the Hidden Harbor Marina. In addition to the three wells mentioned above Unique Well nos. 268354 and 559256 are registered to Harbor Village #2 and Willie's Hidden Harbor, respectively; however, these wells were not mapped on the CWI. According to the owner of the Hidden Harbor Marina, the five wells are used for a variety of purposes, including wash water and drinking water. The City of St. Paul Park confirmed that the Hidden Harbor Marina is not connected to the municipal water supply. The Hidden Harbor Marina is located approximately 0.3 miles south of the fire training area at Marathon Refinery. Discussion of sampling of the wells owned by the Hidden Harbor Marina is presented in **Section 2.3.1**.

The Mississippi River is located approximately 600 feet west of the firefighting training area at the Marathon Refinery. Previous sampling of water, sediments and fish tissue from the Mississippi River as part of the PFC/Firefighting Foam project and other unrelated State projects has identified PFCs in all sampled media. Therefore, the MPCA decided that additional sampling of surface water and sediment from the Mississippi River near the Marathon Refinery would not provide useful data for this project due to the previously identified presence of PFCs in the river and other regional PFC groundwater impacts associated with former 3M landfills in Washington County.

- Bemidji Regional Airport: As presented in the November 2010 Report, the regional groundwater flow direction in the area of the Bemidji Regional Airport is generally to the southeast. The initial receptor survey conducted in October 2010 identified one active water supply well within 1/2-mile downgradient of the Airport. The identified well is at the Kraus Anderson construction shop located to the southeast. However, review of the MDH CWI identified multiple residential wells located between 3/4-mile and 1 mile east and southeast of the firefighting training area at the Bemidji Regional Airport. An expansion of the receptor survey was conducted under a later Work Order, as discussed in **Section 2.3**.

  Grass Lake is located approximately 1/2-mile south-southwest of the firefighting foam training area at the Bemidji Regional Airport. According to personnel with the City of Bemidji Street Department, stormwater flow from the airport is ultimately routed to a wetland to the north of the Airport, thus, Grass Lake does not receive stormwater runoff from the Airport. A figure showing the October 2010 receptor survey area, inferred groundwater flow direction, returned well survey questionnaires, and a MDH CWI map of wells in the area and associated well logs are included as **Appendix B**. Discussion of the subsequent, expanded receptor survey is presented in **Section 2.3.3**.
- ABLE Training Center: As presented in the November 2010 Report, the regional groundwater flow direction in the area of the ABLE Training Center is generally to the northwest, toward the Minnesota River. A figure

showing the receptor survey area, completed well survey questionnaires, and a MDH CWI map of wells in the area of the ABLE Training Center and associated well logs are included as **Appendix C**. No active water supply wells were identified by the receptor survey, except for three municipal wells that were previously sampled twice by the MDH for PFCs. A wetland or pond located across Cliff Road from the ABLE Training Center was identified as a potential receptor for groundwater or stormwater runoff from the site.

- MSP Airport: As presented in the November 2010 Report, the regional groundwater flow direction in the area of MSP Airport is generally to the southeast, toward the Minnesota River. A figure showing the receptor survey area, inferred groundwater flow direction, and a MDH CWI map indicating the lack of wells within the survey area are included as **Appendix D**. No water supply wells or surface waters were identified within the receptor survey area. The Minnesota River is located approximately 1.8 miles southeast of the former firefighting training areas at MSP Airport.
- Lake Superior College ERTC: As presented in the November 2010 Report, the inferred groundwater flow direction in the area of the ERTC is generally to the south, toward the St. Louis River. However, localized features such as creeks that flow to the southeast and a historical gravel pit to the west may influence groundwater flow at the ERTC. Therefore the receptor survey included areas within 1/2-mile to the west and southeast. A figure showing the receptor survey area, inferred regional groundwater flow direction, completed well survey questionnaires, and a MDH CWI map of wells in the area of the ERTC are included as **Appendix E**. No well logs for the wells identified in the survey area were available on the CWI. Five active water supply wells were identified during the walking survey at nearby houses on Highway 23 in Duluth. One of the wells is shared by two houses. The City of Duluth Public Works Department confirmed that municipal water is not currently utilized by the identified houses. In addition, two creeks flow near the firefighting practice area at the ERTC, which apparently join up before flowing southward beneath Highway 23 to the backwater of the St. Louis River. One of the creeks appears to flow through a wetland located adjacent to the firefighting practice area. Sediments and surface waters of the wetland and creek were sampled previously.

Based on the results of the receptor surveys the following recommendations were made in the November 2010 Report:

- pursuit of access to the five wells at the Hidden Harbor Marina for PFC sampling;
- pursuit of access to the Kraus Anderson shop well in Bemidji for PFC sampling;
- completion of an expanded receptor survey to include private wells further east and southeast of the Bemidji Regional Airport;
- pursuit of access to the wetland or pond near the ABLE Training Center in Burnsville for PFC sampling of wetland surface water and sediment; and,

- pursuit of access to the residential wells near the Lake Superior College for PFC sampling, and access to the ERTC for follow-up surface water and sediment sampling for PFCs.

2.1.2 Follow-Up Sampling at Kandiyohi County Landfill

In October 2009 approximately 545 gallons of Class B AFFF were used on a fire at the Kandiyohi County Landfill. Groundwater samples were collected from existing landfill monitoring wells DMW-1A and DMW-3 in January 2010 and May 2010. Well DMW-1A is located upgradient of the fire area, and DMW-3 is located approximately 300 to 350 feet downgradient of the fire area. A figure illustrating the approximate area of the fire and the referenced monitoring wells is included in **Appendix F**. No PFCs were identified in either sample collected from DMW-1A, and only low levels of perflourobutanoic acid (PFBA) were found in the samples collected from DMW-3 (see **Table 1)**. Additional sampling was recommended in the June 2010 Report to assess groundwater conditions over time downgradient of the fire area.

Follow-up groundwater samples were collected from DMW-1A and DMW-3 on August 12, 2010, for PFC analysis. The samples were submitted to Axys Analytical Services for analysis of PFCs.

Laboratory analysis did not detect any PFCs in the (upgradient) DMW-1A sample and only a low concentration of PFBA in the (downgradient) DMW-3 sample, which is consistent with previous sampling results (see **Table 1**). Details of and results for the follow-up sampling at Kandiyohi County Landfill are presented in the November 2010 Report.

Continued groundwater sampling from DMW-1A and DMW-3 was recommended in the November 2010 Report. However, the MPCA decided that additional sampling was not warranted at that time since the nearest potential groundwater receptor is located approximately one-half mile southwest of the fire area at the landfill, and significant concentrations of PFCs have been not detected in DMW-3. With the passage of more time to allow for PFCs, if present, to reach the monitoring wells, re-sampling of DMW-1A and DMW-3 should be reconsidered.

2.1.3 Follow-Up Sampling at Shingle Creek

Interviews with responding municipal fire departments around the Crystal Airport in Crystal indicated that Class B AFFF may have been used in the past to respond to plane crash-related fires at the Crystal Airport. Generally, storm water runoff flows through various pathways and drainage ditches across the airport grounds to Shingle Creek. Shingle Creek flows along the east side of Crystal Airport to the southeast, emptying into Twin Lake. In a project unrelated to the PFC/Firefighting Foam project, PFCs were identified in fish samples collected from Twin Lake, including high levels of PFOS. The source of the PFOS in the fish collected from Twin Lake has not been identified to date.

Soil, groundwater, and sediment sampling for PFCs was conducted at Crystal Airport in January 2010 from several locations, including upstream and downstream locations in Shingle Creek adjacent to Crystal Airport. A figure showing the January 2010 sample locations is included in **Appendix G**. Due to the winter season and lack of water

in the creek, only sediment samples were collected from the Shingle Creek in January 2010. Sampling results identified several PFC compounds in the downstream sediment sample; PFCs were not detected above laboratory detection limits in the sediment sample collected from the upstream location in Shingle Creek (see **Table 2**). The January 2010 sampling event at Crystal Airport is presented in the February 2010 and June 1010 Reports. The June 2010 Report recommended surface water sampling and follow-up sediment sampling from Shingle Creek for PFCs.

Follow-up sediment samples and surface water samples were collected from Shingle Creek on October 1, 2010, from the same locations upstream and downstream of the Crystal Airport as the January 2010 samples. A figure showing the October 2010 sample locations is included in **Appendix G**. The samples were submitted to Axys Analytical Services for analysis of PFCs.

Laboratory results for surface water samples Crystal SW-1 (upstream sample) and Crystal SW-2 (downstream sample) detected concentrations of several PFC compounds; all of the concentrations were below the State HRLs (see **Table 1**). Although the HRLs are not necessarily applicable to the surface water in Shingle Creek, they are presented here and in Table 1 for comparison purposes only. The PFC concentrations detected in the upstream sample were slightly higher than those detected in the downstream sample. Details of the sampling and laboratory results for the surface water samples only are presented in the November 2010 Report; the laboratory results for the sediment sample were not available at the time of the November 2010 Report.

Laboratory results for the upstream and downstream sediment samples (Crystal Sed-3 and Crystal Sed-4, respectively) collected on October 1, 2010, were received after the November 2010 Report was finalized. Laboratory results are included in **Table 2**. Laboratory analysis did not detect any PFCs in the upstream Crystal Sed-3 sample. Low concentrations (less than 5 nanograms-per-gram (ng/g), which is roughly equivalent to parts-per-billion) of several PFC compounds were detected in the downstream Crystal Sed-4 sample. The PFC concentrations in Crystal Sed-4 were slightly lower than concentrations detected in downstream sample Crystal Sed-2 collected in January 2010. PFC concentrations in all sediment samples collected from Shingle Creek were below MPCA Tier 1 Soil Reference Values (SRVs). Although the Tier 1 SRVs are not necessarily applicable to sediments in Shingle Creek, they are presented here and in Table 2 for comparison purposes only.

Based on the relatively low concentrations of PFCs detected in sediment and surface water samples collected from Shingle Creek adjacent to Crystal Airport, no further sampling is recommended at this time.

2.2 Work Order SFDE1111

Antea Group performed the following scope of work under MPCA Work Order SFDE1111, dated October 20, 2010, based on results of the groundwater receptor survey and previous creek and wetland sampling at the Lake Superior College ERTC in Duluth:

1. An access agreement was implemented between the MPCA and Lake Superior College for additional PFC sampling of surface waters and sediments at the ERTC.

2. Access agreements were implemented between nearby well owners and the MPCA for PFC sampling of their water wells.
3. Surface water and sediment samples were collected at the ERTC from the wetland and the creek located adjacent to the ERTC fire training area for PFC analysis.
4. Water samples were collected from two of the (five) private water wells located within one-half mile of the ERTC for analysis of PFCs.
5. Sediment, surface water and well water samples were analyzed by a State-contracted laboratory for analysis of PFCs.
6. A report was prepared summarizing the work performed as part of the scope of work (the February 2010 Report).

2.2.1 Follow-up Sampling at Lake Superior College ERTC

Previous sampling in November 2009 of surface water and sediments from a wetland at the ERTC, as well as sampling of soil and creek sediment below the outfall for a 6-inch perforated pipe that runs beneath the fire training area identified PFC concentrations present in all of the media sampled (see **Tables 1 and 2**). A laboratory data table specific to samples collected at and in the vicinity of the ERTC is included in **Appendix H**. A Site Map showing sample locations at the ERTC is included in **Appendix H**. The concentrations of PFOA and PFOS detected in the surface water sample (ERTC SW-1) collected from the wetland were higher than the HRLs. Although the HRLs are not necessarily applicable to surface waters of the State, there was a concern that elevated concentrations of PFOA and PFOS could reach groundwater or a drinking water aquifer that is utilized by nearby water supply wells.

An access agreement between the MPCA and Lake Superior College was executed on November 8, 2010, allowing access for PFC sampling of a wetland and a creek at the ERTC. A copy of the access agreement is included in the February 2011 Report.

Sediment and surface water samples were collected by Antea Group on November 18, 2010, at or near the locations of previous sediment and surface water samples. Sample locations are shown on the Site Map included in Appendix H. In addition, a surface water sample was collected from the creek. Sediment and surface water samples collected from the wetland were labeled “ERTC Sed-3” and “ERTC SW-2”. The sediment and surface water samples collected from the creek were labeled “ERTC Sed-4” and “ERTC SW-3.” The samples were submitted to Axys Analytical Services for analysis of PFCs.

Laboratory analysis detected approximately similar PFC concentrations in ERTC Sed-4 as previous creek sediment sample ERTC Sed-1, and in ERTC Sed-3 as previous wetland sediment sample ERTC Sed-2 (see **Table 2**). PFC concentrations in all sediment samples, and soil sample ERTC SS-1 collected previously, were below MPCA Tier 1 SRVs. Although the Tier 1 SRVs are not necessarily applicable to soils and sediments at the ERTC, they are presented here and in Table 2 for comparison purposes only.

The PFC concentrations detected in wetland surface water sample SW-2 were lower than concentrations in the November 2009 wetland sample SW-1 (see **Table 1**). PFOS concentrations detected in both surface water samples SW-1 and SW-2 exceeded the HRL, with concentrations of 11,300 nanograms per liter (ng/L) and 7,640 ng/L, respectively. The PFOA concentration of 991 ng/L detected in the November 2009 SW-1 sample exceeded the HRL of 300 ng/L, but the PFOA concentration of 290 ng/L detected in SW-2 in November 2010 was below the HRL. The PFOS concentration of 7,630 ng/L detected in the creek surface water sample (ERTC-SW-3) also exceeded the HRL. Although the HRLs are not necessarily applicable to surface waters at the ERTC, they are presented here for comparison purposes only.

Details of and results for the follow-up sampling at Lake Superior College ERTC are presented in the February 2011 Report.

2.2.2 Well Sampling near Lake Superior College ERTC

The groundwater receptor survey conducted in September and October 2010 identified six residences within one-half mile of the ERTC that utilized drinking water from five private wells; two of the houses shared one well (see **Table 3**). The locations of the residences are shown on a map of the ERTC surrounding area included in **Appendix H**. The City of Duluth Public Works Department confirmed that the houses within the receptor survey area are not connected to the municipal water supply, but that a water main is available to one of the properties, at 11825 Highway 23.

Access agreements were sent to the owners of the identified residences with private wells, requesting access to their residences to collect water samples from private wells for analysis of PFCs. Three of the well owners provided access to the MPCA and Antea Group as their contractor to sample their wells. However, a sampling appointment for the residence at 11825 Highway 23 s was cancelled and was not rescheduled. Copies of the access agreements are included in the February 2011 Report.

On November 19, 2010, water samples were collected from private wells at two residences located within one-half mile of the Lake Superior College ERTC, at 10801 and 11601 Highway 23 in Duluth. The sample collected from the residence at 10801 Highway 23 was labeled “ERTC-10801,” and the sample collected at 11601 Highway 23 was labeled “ERTC-11601.” The samples were submitted to Axys Analytical Services for analysis of PFCs.

The only PFC compounds detected in the water well samples collected from the private water wells at 10801 and 11601 Highway 23 were PFOS and perfluorohexane sulfonate (PFHxS). The PFOS concentrations of 6.49 ng/L and 7.26 ng/L were below the HRL of 300 ng/L. The concentrations of PFHxS detected in the well water samples were 11.2 ng/L and 9.63 ng/L; the RAA for PFHxS does not include a numerical standard. All of the other PFC compounds were not detected above laboratory detection limits in either well water sample. Sample results are included on **Table 1**. Sample results were provided to the home owners.

Details of and results for the private well sampling associated with the Lake Superior College ERTC are presented in the February 2011 Report.

2.3 Work Order SFDE1113

Antea Group performed work under MPCA Work Order SFDE1113, dated November 30, 2010, based on results of the groundwater receptor surveys conducted in the vicinities of the firefighting training areas at the following locations: Marathon Refinery, Bemidji Regional Airport, and the ABLE Training Center. The scope of work performed under Work Order SFDE1113 included the following activities:

1. An access agreement was executed between the MPCA and the owner of the Hidden Harbor Marina to allow sampling of five water supply wells at the Marina for PFC analysis. Water samples were collected from these wells and submitted for laboratory analysis of PFCs.
2. An access agreement was executed between the MPCA and the City of Burnsville to allow surface water and sediment sampling for PFCs at the wetland or pond located on City property north of the ABLE Training Center. A surface water sample and a sediment sample were collected and submitted for laboratory analysis of PFCs.
3. A well receptor survey was conducted for the neighborhood located approximately 3/4-mile east of the Bemidji Regional Airport.
4. Access agreements were executed between the MPCA and select well owners in Bemidji for sampling of their water wells for PFCs. Water samples were collected from the select wells and submitted for laboratory analysis of PFCs.
5. A report was prepared summarizing the work performed as part of the scope of work (the May 2010 Report).

2.3.1 Sampling at the Hidden Harbor Marina

Sampling of select existing groundwater monitoring wells near and upgradient of the firefighting training area at the Marathon Refinery was conducted in August 2009. Laboratory analysis of five water samples plus one duplicate sample identified PFCs in all of the samples, including PFOS concentrations above the HRL. The laboratory analytical results are included in **Table 1**. Sampling at the Marathon Refinery is discussed in the February 2010 Report.

As discussed in **Section 2.1.1**, the groundwater receptor survey conducted in the vicinity of Marathon Refinery in October 2010 identified five water supply wells owned by the owner of the Hidden Harbor Marina, as follows:

- Unique Well No. 268354 at the marina workshop that is used for non-potable uses such as toilets and cleaning boats (labeled “Well A- Hidden Harbor” for sampling purposes).
- Unique Well No. 559256 at the marina that supplies water to the on-site restaurant and to marina boat customers (“Well B-Hidden Harbor”).
- A residential well located at the house associated with the marina. This house is currently being used as the shower house for marina customers. The unique well number for this well is unknown (“Well C-Hidden Harbor”).

- A residential well located at the house at 1001 Oak Street, just south of the marina. The unique well number for this well is unknown ("Well D-Hidden Harbor").
- Unique Well No. 429870 at the house at 115 10th Avenue West, just south of the marina ("Well E-Hidden Harbor").

Unique Well nos. 441942 and 576171 are likely associated with Well C and Well D, however, insufficient information was readily available to match up the physical wells with the unique well numbers. A figure showing the locations of the sampled wells at the Hidden Harbor Marina is included as **Appendix I**.

An access agreement between the MPCA and the owner of the Hidden Harbor Marina allowed for sampling of the above-identified wells. Water samples were collected from all five wells on March 3, 2011. The well samples were labeled as indicated above and submitted to Axys Analytical Services for analysis of PFCs.

Laboratory results for the well samples collected at the Hidden Harbor Marina are summarized on **Table 1**. Laboratory analysis detected low levels of perfluorinated carboxylic acids in three of the Hidden Harbor Marina well samples: the water well at the restaurant (Unique No. 559256/Well B), and the houses at 1001 Oak Street (Well D) and 115 10th Avenue West (Unique No. 429870/Well E). All detected PFC concentrations were below the HRL or other drinking water health-based values defined by the MDH (see **Table 1**). Sampling results were provided to the owner of the Hidden Harbor Marina.

The PFC compound that was detected above the HRL at the Marathon Refinery was PFOS, which is a perfluorinated sulfonate. No perfluorinated sulfonates were detected in any of the Hidden Harbor Marina well samples, only perfluorinated carboxylic acids were detected in the Hidden Harbor Marina well samples. Based on the different types of PFC compounds detected in the wells at the Marathon Refinery and the Hidden Harbor wells, the PFC impacts in groundwater at the Hidden Harbor Marina do not appear to be from the firefighting training area at the Marathon Refinery.

The City of St. Paul Park is included in an area of Washington County known to have low levels of PFC groundwater impacts associated with landfills where 3M wastes were historically dumped. Assessment and monitoring data associated with the 3M wastes in Washington County are available at the MPCA and MDH websites.

Details of and results of the Hidden Harbor Marina well sampling are presented in the May 2011 Report.

2.3.2 Sampling at Wetland Near the ABLE Training Center

Groundwater sampling was conducted at the ABLE Training Center in August 2009. A groundwater sample was collected from soil boring B-3. (Attempts to collect groundwater samples from borings B-1 and B-2 were unsuccessful.) Laboratory analysis of the groundwater sample (Burnsville B-3 GW 44.5 ft.) detected several PFCs in the sample, including PFOA and PFOS at concentrations above the HRL (see **Table 1**).

As discussed in **Section 2.1.1**, the groundwater receptor survey conducted in the vicinity of the ABLE Training Center did not identify any water supply wells except for the municipal wells already sampled by the MDH. A wetland or pond located across Cliff Road from the ABLE Training Center was identified as a potential receptor for storm water runoff. The wetland is on property owned by the City of Burnsville.

An access agreement executed between the MPCA and the City of Burnsville allowed for sampling of the surface water and sediment from the wetland for PFCs. A surface water sample (Burnsville Pond SW-1) and a sediment sample (Burnsville Pond Sed-1) were collected from the wetland on April 20, 2011. The sample locations are shown on a figure included as **Appendix J**. The well samples were submitted to Axys Analytical Services for analysis of PFCs.

The laboratory results for the surface water sample collected at the Burnsville wetland are included on **Table 1**. Low levels of perfluorinated carboxylic acids were detected in the surface water sample, at concentrations below the HRL or other drinking water health-based values defined by the MDH. The State drinking water criteria are not necessarily applicable to surface waters, but are discussed here for comparison purposes only. There are no surface water criteria for PFCs applicable to the sampled wetland in Burnsville. Details of the sampling from the Burnsville wetland, and laboratory results for the surface water sample only, are presented in the May 2011 Report; the laboratory results for the sediment sample were not available at the time of the May 2011 Report.

Laboratory results for the sediment sample collected from the Burnsville wetland were received after the May 2011 Report was finalized. Laboratory results are included in **Table 2**. Laboratory analysis detected relatively low concentrations of PFCs in the Burnsville Pond Sed-1 sample, at concentrations below the MPCA Tier 1 SRVs. Although the Tier 1 SRVs are not necessarily applicable to sediments at the wetland in Burnsville, they are presented here and in Table 2 for comparison purposes only.

The types of PFC compounds detected in soil and groundwater samples collected from soil borings at the ABLE Training Center are similar to those detected in the Burnsville Pond samples. The PFCs detected in the Burnsville pond/wetland may or may not be from the ABLE Training Center, as stormwater runoff entering the pond/wetland may be picking up PFCs from other potential sources in the area. An assessment of other potential PFC sources in the area was not completed as part of this project. Since the PFC concentrations in the Burnsville Pond samples were relatively low an assessment of other potential PFC sources in the area does not appear to be warranted at this time.

2.3.3 Expanded Well Survey and Sampling Near the Bemidji Regional Airport

Soil and groundwater sampling was conducted in November 2009 at the area in front of the fire station at the Bemidji Regional Airport, where the Bemidji Fire Department trains periodically with Class B AFFF. Soil and groundwater samples were collected from two soil borings, B-1 and B-2. Laboratory analysis of the groundwater samples identified several PFCs, including PFOS at concentrations above the HRL (see **Table 1**).

As discussed in Section 2.1.1, Antea Group conducted a groundwater receptor survey in October 2010 of the area located within one-half mile south and southeast of the training area at the Bemidji Airport. This initial receptor survey identified one active water supply well, the Kraus Anderson shop well. Information regarding the October 2010 receptor survey is presented in the November 2010 Report.

Other domestic water wells were known to exist outside the October 2010 receptor survey area. The MDH expressed some concern that shallow domestic wells located in a neighborhood between 3/4-mile and 1 mile east of the fire foam training area at the airport could potentially be impacted by the PFC groundwater impacts. Thus, a recommendation was made in the November 2010 Report to conduct a receptor survey in this area and sample a select number of wells identified in the survey.

Well survey letters were mailed to the owners of 33 properties in the neighborhood immediately east of the Bemidji Regional Airport in December 2010. Completed well surveys were returned by 17 well owners; the completed surveys identified 13 active wells in the neighborhood. A table summarizing all properties surveyed and survey responses received is included in **Appendix K**. A map showing the survey area is also included in **Appendix K**.

Of the thirteen active wells identified during the survey, six of the wells were selected for PFC sampling. The wells were selected so as to sample from varying depths and locations within the survey neighborhood. A seventh well, the well at the Kraus Anderson shop, was also selected for PFC sampling.

Access agreements between the MPCA and the selected seven well owners allowed for the sampling of their wells for PFCs. The wells were sampled on March 24, 2011, with the following exception: the well owner at 2120 Anne Street NW was not available on the day of sampling. The locations of the wells sampled are included on the map of the survey area included in **Appendix K**. A laboratory-supplied sample jar, nitrile sampling gloves, and cooler were left at 2120 Anne Street NW by Antea Group personnel on March 24, 2011. The property owner collected a sample from the well on March 29, 2011 and shipped the sample in the cooler provided to Antea Group. The well samples were labeled as follows:

- Bemidji 2021 Anne
- Bemidji 2326 Bardwell
- Bemidji 3481 Laurel
- Bemidji 2316 Bardwell
- Bemidji 2103 Anne
- Bemidji Kraus Anderson
- Bemidji 2120 Anne

Water samples were submitted to Axys Analytical Services for laboratory analysis of PFCs. Details of the sampling from the wells in Bemidji are presented in the May 2011 Report; the laboratory results for the water samples were not available at the time of the May 2011 Report.

Laboratory analysis of the well samples did not detect any PFCs in the following samples: Bemidji 2021 Anne, Bemidji 2326 Bardwell, Bemidji 3481 Laurel, and, Bemidji 2120 Anne. Low levels of PFBA were detected in the Bemidji 2316 Bardwell and Bemidji Kraus Anderson samples, at concentrations higher than PFBA levels detected in soil boring samples B-1 and B-2 collected at the airport. Low levels of PFHxS and PFOS were detected in the Bemidji 2103 Anne sample. All PFC concentrations detected were below the HRLs or HBVs. Laboratory results are included on **Table 1**.

The well at 2103 Anne Street NW is reportedly 55 feet deep; a search of the MDH CWI did not locate the well log. This is the only well sampled where PFOS was detected; PFOS is the PFC compound detected in groundwater above the HRL at the Bemidji Regional Airport borings. The wells at 2021 and 2120 Anne Street NW are located on adjoining properties to 2103 Anne Street NW and are both reportedly 30 feet deep; no PFCs were detected in either of these wells. The well at 2326 Bardwell Drive NW is reportedly 52 feet and is situated roughly between the firefighting training area at the Bemidji Regional Airport and the house at 2103 Anne Street NW and is of similar depth to the well at 2103 Anne Street NW; however, no PFCs were detected in the well sample collected at 2326 Bardwell Drive NW.

The data collected during this investigation is inconclusive in determining whether or not the PFCs detected in the wells at 2103 Anne Street NW, 2316 Bardwell Drive NW, and the Kraus Anderson shop are due to the discharge of Class B AFFF at the Bemidji Regional Airport.

3.0 CONCLUSIONS AND RECOMMENDATIONS

3.1 MSP Airport

No potential groundwater receptors were identified in the receptor survey area at MSP Airport. Antea Group recommends no further actions at this time with regards to PFCs in the soil and groundwater at the former fire training areas at MSP Airport.

3.2 Kandiyohi County Landfill

Three rounds of groundwater sampling have been collected from existing monitoring wells since the October 2009 fire at the Kandiyohi County Landfill. Laboratory analyses of the groundwater samples have detected similar concentrations of PFBA in DMW-3, which is presumably located downgradient of the site of the landfill fire. No other PFC compounds were detected in groundwater samples from DMW-3, and no PFCs have been detected in upgradient groundwater samples collected from DMW-1A.

At all of the firefighting foam training sites where groundwater was sampled as part of the PFC/Firefighting Foam investigation, foam training occurred either historically or over the course of several years time. There are no other sites besides the Kandiyohi County Landfill where groundwater was sampled so soon after the release of Class B AFFF, thus, there are no comparable sites to evaluate “breakthrough” data for PFC migration through soil and

groundwater to a monitoring point. The lack of significant concentrations of PFCs detected in groundwater at DMW-3 may be due to travel time associated with both the migration of PFC-containing Class B AFFF from the surface of the landfill where foam was discharged to the water table, and the transport of PFCs in groundwater to the location of DMW-3.

Antea Group recommends additional sampling of groundwater at DMW-1A and DMW-3 to continue monitoring for PFCs in groundwater associated with the October 2009 discharge of firefighting foam. If significant concentrations of PFCs are detected at DMW-3 in the future, sampling for PFCs at the private well located approximately 1/2-mile downgradient should be considered.

3.3 Crystal Airport

Based on the relatively low concentrations of PFCs detected in soil and groundwater samples collected at Crystal Airport and in sediment and surface water samples collected from Shingle Creek adjacent to Crystal Airport, no further sampling at Crystal Airport or Shingle Creek is recommended at this time.

3.4 Lake Superior College ERTC

Based on the sediment and water samples collecting during this assessment, the elevated levels of PFCs detected in the creek and wetland sediment and surface water samples at the ERTC do not appear to be impacting the nearby drinking water supply wells at or above drinking water standards. According to the former and current program supervisors at the ERTC, Class B AFFF is no long used in training. The former program supervisor interviewed as part of this PFC/Firefighting Foam investigation indicated Class B AFFF hadn't been used at the ERTC since approximately 1996. No further assessment of PFCs at the Lake Superior College ERTC is recommended at this time.

3.5 Marathon Refinery

Sampling results for the water well samples collected from the five wells at the Hidden Harbor Marina indicate concentrations of PFCs are below the State HRL or other drinking water health-based values defined by the MDH. Based on the type of PFC compounds detected in the wells at the Marathon Refinery and the Hidden Harbor wells, the PFC impacts in groundwater at the Hidden Harbor Marina do not appear to be from the firefighting training area at the Marathon Refinery. The Marathon Refinery's fire department switched from 3M Class B alcohol resistant (AR)-AFFF to Ansul-brand AR-AFFF in approximately 2000. Spent foam and water used at the fire training area at the refinery is routed via storm sewers to an on-site wastewater treatment plant. No further well sampling at Marathon Refinery or the Hidden Harbor Marina in association with the PFC/Firefighting Foam project is recommended at this time.

3.6 ABLE Training Center, Burnsville

Relatively low levels of PFCs were detected in the surface water and sediment samples collected from the pond or wetland located downgradient of the ABLE Training Center. According to fire department personnel from Apple Valley, Burnsville, Lakeville and Eagan interviewed during this PFC/Firefighting Foam investigation, Class B AFFF has

not been used at the ABLE Training Center since approximately 2004. No further sampling in association with PFCs identified at the ABLE Training Center in Burnsville is recommended at this time.

3.7 Bemidji Regional Airport

PFC concentrations detected in groundwater samples collected from nearby private wells were below the State HRL or other drinking water health-based values defined by the MDH. PFC concentrations detected in nearby municipal wells sampled by the MDH were also below the HRL or other drinking water health-based values. According to the training officer for the Bemidji Fire Department, they no longer train with Class B AFFF but use dish soap instead for training purposes. No further PFC sampling at the Bemidji Regional Airport or nearby wells appears warranted at this time.

3.8 Large Fire Sites

Sampling conducted as part of the MPCA's PFCs/Firefighting Foam investigation has identified PFCs in soil, groundwater, surface water and sediments at sites where significant quantities of Class B AFFF were discharged either repeatedly over time at a training site, or during a fire response. While the use of Class B AFFF is necessary and should be used to protect lives and property at a Class B fire, the release or migration of PFC-containing Class B AFFF to non-paved surfaces or surface water bodies will likely result in the release of PFCs to the environment. The release of PFC-containing Class B AFFF in or near environmentally sensitive areas such as Wellhead Protection Areas, areas with shallowly underlying karst bedrock, or lakes or streams may inadvertently provide an exposure pathway that may potentially impact human health via drinking water, direct exposure, or fish consumption. At large fire sites were significant quantities of Class B AFFF are discharged, the MPCA may want to assess the environmental setting, the presence of nearby surface waters, the presence of water supply wells in the area, and the potential risk posed to identified receptors. Water sample collection from private wells or surface water bodies for PFCs may be warranted dependent upon results of the assessment.

4.0 REMARKS

The recommendations contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's client. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

Notes:
All results and standards are in nanograms per liter (ng/L), which is equivalent to parts per trillion.
Axys: Axys Analytical Services LTD
MPI: MPI Research
MDH: Minnesota Department of Health Environmental Laboratory.
Exygen: Exygen Research
Bolded type indicates detection above the laboratory method detection limit.
Highlighted concentrations exceed the Health-Based Limit.
(1) Health-Based Value (HBV) for chronic exposure defined by the Minnesota Department of Health.
(2) Health Risk Limit (HRL) for drinking water defined by the Minnesota Department of Health.
(3) Risk Assessment Advice (RAA) set by the Minnesota Department of Health for PFHxS does not specify numeric values.
ND: No health-based limit defined.
(4) Manually Calculated Result is 18.9
(5) Manually Calculated Result is 17.1
(6) Manually Calculated Result is 23.3
(7) Manually Calculated Result is 21.7
(J) Analyte positively identified, result is below reporting limit and is estimated.
*Sample collected upgradient of fire foam training or discharge area, intended to act as "background" sample.
NA: Not analyzed

Notes:
PFC results and standards are in nanograms per gram (ng/g), which is equivalent to parts per billion.
TOC results are in milligrams per kilogram (mg/kg), which is equivalent to parts per million.
Tier 1 Residential SRV: Minnesota soil reference value for chronic human exposure in a residential setting.
Tier 2 Recreational SRV: Minnesota soil reference value for exposure in a recreational setting.
Tier 2 Industrial SRV: Minnesota soil reference value for exposure in an industrial setting.
PFC compounds soil results reported on a dry weight basis.
ND: No SRV defined.
Axys: Axys Analytical Services LTD
MPI: MPI Research
TOC analyses performed by Pace Analytical Services.
Bolded type indicates detection above the laboratory method detection limit.
NA: not analyzed
(1) Results based on analysis of a dilution of the sample extract.

WELL RECEPTOR SURVEY SUMMARY FOR SELECT FIRFIGHTING FOAM TRAINING SITES IN MINNESOTA
OCTOBER - NOVEMBER 2010

Site # From Receptor Survey Map	Property Address	Property Occupant	Water Supply Well (Yes or No)	Well Use	Use of Public Water Supply?	How Determined	Public Water Supply Connection Confirmed?	Comments
BEMIDJI REGIONAL AIRPORT								
1	3824 Moberg Dr. NW	Bemidji Regional Airport	No	NA	Yes	Interview, Airport Manager	No	
2	3507 Gillet Dr. NW	Rausch Cold Weather Testing Facility	No	NA	Yes	Interview, site personnel	No	
3	3700 Norris Ct. NW	Bureau of Criminal Apprehension, MN Dept. of Public Safety	No	NA	Yes	Interview, site personnel	No	
4	3622 Moberg Dr. NW	Great River Dentistry	No	NA	Yes	Questionnaire returned	No	
5	3600 Moberg Dr. NW	Indoor Auto Mall	No	NA	Yes	Interviews, current and previous site owners	No	Well no. 169190 was a water supply well at this site; well has been sealed.
6	3500 Moberg Dr. NW	Quality Inn	No	NA	Yes	Interview, site manager	No	
7	3300 Gillett Dr. NW	Paul Bunyan Elementary & ISD #31 Offices	No	NA	Yes	Interview, school district business manager	No	
8	Gillett Dr. NW	City of Bemidji Water Treatment Facility	No	NA	Yes	Interview, City of Bemidji Public Works	No	
9	3168 Adams Av. NW	Kraus Anderson Construction Co.	Yes	Non-potable		Interview, site personnel	No	
10	3920 Hwy. 2 W.	MNDOT Northwest District	No	NA	Yes	Interview, site personnel	No	
ABLE TRAINING CENTER, BURNSVILLE								
Site	River Ridge Blvd.	ABLE Fire Training Center	No	NA	Yes	Interview, Burnsville Fire Chief	No	
1	12205 River Ridge Blvd.	Northern Tool & Equipment	No	NA	Yes	Interview, site personnel	No	
2	12101 Interstate 35W S.	Dodge of Burnsville	No	NA	Yes	Questionnaire returned	No	
3	600 121st St. W.	Walser Suburu	No	NA	Yes	Interview, site personnel	No	
4	12001 Interstate 35W S.	All State Self Storage	No	NA	Yes	Interview, site personnel	No	
5	11937 Interstate 35W S.	Chalet Driving Range	No	NA	Yes	Interview, property owner	No	Several groundwater monitoring wells related to a historical dump are located on the property.
6	Pleasant Av.	Archery range, tree/brush dump	No	NA	No	Interview, Burnsville Public Works	No	
7	201 121st St. W.	Bury & Carlson, concrete/asphalt recycling	No	NA	Yes	Interview, site personnel	No	
8	25 Cliff Rd. W.	Rivers Edge Business Center	No	NA	Yes	Questionnaire returned	No	
9	15 Cliff Rd. W.	American Electric Motion	No[1]	NA	Yes	Questionnaire not returned	No	
10	12259 Nicollet Av.	Nicollet Business Campus II	Unknown	NA	Yes	Questionnaire returned	No	Managed by Wellington Management
11	12270 Nicollet Av.	Nicollet Business Campus	No	NA	Yes	Questionnaire returned	No	Managed by Wellington Management
12	50 River Ridge Ct.	Burnsville Public Works	Yes	Municipal	Yes	Interviews with Public Works personnel	NA	City well nos. 1, 2, 4, 5, 7, 8 nearby, locations indicated by Public Works personnel. No other water supply in survey area known to Public Works personnel.
13	12200 River Ridge Blvd.	Vacant/undeveloped	Yes	Industrial	NA	Site visit; correspondence with State, County.	No	Unique well no. 229108, industrial well, registered active. Buildings recently demolished and site razed. Site currently vacant. State and County cannot confirm current well status. No wells were observed on the property.
LAKE SUPERIOR COLLEGE ERTC, DULUTH								
Site	11501 Hwy. 23	Lake Superior College ERTC	No	NA	Yes	Interview, Program Supervisor	Yes	
1	10401 Hwy. 23	Residence	No	NA	No	Interview, homeowner	City Public Works confirmed no connection	Residence connected to private well at 10423 Hwy. 23.
2	10423 Hwy. 23	Residence	Yes	Drinking	No	Based on other interviews	City Public Works confirmed no connection	Questionnaire not returned.
3	11801 Hwy. 23	Residence	Yes	Drinking	No	Interview, homeowner	City Public Works confirmed no connection	
4	11601 Hwy. 23	Residence	Yes	Drinking	No	Interview, homeowner	City Public Works confirmed no connection	Well depth 411 feet.
5	11605 Hwy. 23	Residence	Yes	Drinking	No	Interview, homeowner	City Public Works confirmed no connection	New well pump recently installed, depth to water ~75 feet.
6	11825 Hwy. 23	Residence	Yes	Drinking	No	Interview, homeowner	City Public Works confirmed no connection

Receptor Survey Questionnaire

PROPERTY ADDRESS: 388 9th Av. W - Hidden Harbor Marina

1. Is there, or has there ever been, a water well on the property? **Yes** **No** **Unknown**

If you answered **No or Unknown**, proceed to Question 2. 5 wells on property

1a. If you answered **Yes**, is the well *active* (in use), *abandoned* (not in use), or *sealed* (decommissioned following Minnesota Department of Health [MDH] Well Code guidelines).

X ACTIVE _____ABANDONED _____SEALED

1b. How deep is (was) the well? _____FEET (if depth is unknown check here _____)

1c. In what year was the well installed (if known)? _____ Bought property ~1 year ago

1d. If the well was abandoned, what year was the well sealed?_____

3e. If the well is active, for what purpose is it used? Example: (drinking water, lawn sprinkler, cooling, etc.)_____

1f. Where on the property is (was) the well located? 1 - Maintenance 1 - Restaurant 1 - Boats 1 - Hosing 1 - Drink water

1g. If there is currently a water supply well on the property, would you grant access to the property in order to obtain a water sample from either an indoor or outside faucet (at no cost to property owner)?

Yes **No** 810 & 812 Front St - owned by Marina

Name_____

Telephone Number_____DAY or EVENING (please circle one and state best time to reach you)

2. Is a public water supply currently utilized by the property? **Yes** **No**

3. May we contact you for further information if necessary? If so, please provide your name and telephone number.

Name Tim Kennedy

Telephone Number 651-400-0846 DAY or EVENING (please circle one and state best time to reach you)

Please complete this form and mail it back to Delta in the enclosed self-addressed stamped envelope. Delta thanks you in advance for taking the time to complete this form.

If you have any questions, or need help completing this form, please feel free to contact Nancy Rodning, Delta Consultants, at (651)697-5152 or 1-800-477-7411, or Nile Fellows, MPCA, at 651-757-2352.

Receptor Survey Questionnaire – over Telephone 10-11-10 12:50pm

PROPERTY ADDRESS: Quality Inn 3500 Mokers Dr.

1. Is there, or has there ever been, a water well on the property? **Yes** (No) **Unknown**

If you answered **No or Unknown**, proceed to Question 2.

1a. If you answered **Yes**, is the well *active* (in use), *abandoned* (not in use), or *sealed* (decommissioned following Minnesota Department of Health [MDH] Well Code guidelines).

_____ACTIVE _____ABANDONED _____SEALED

1b. How deep is (was) the well? _____FEET (if depth is unknown check here _____)

1c. In what year was the well installed (if known)? _____

1d. If the well was abandoned, what year was the well sealed?_____

3e. If the well is active, for what purpose is it used? Example: (drinking water, lawn sprinkler, cooling, etc.)_____

_____

1f. Where on the property is (was) the well located?_____

_____

_____

1g. If there is currently a water supply well on the property, would you grant access to the property in order to obtain a water sample from either an indoor or outside faucet (at no cost to property owner)?

Yes **No**

Name_____

Telephone Number_____DAY or EVENING (please circle one and state best time to reach you)

2. Is a public water supply currently utilized by the property? (Yes) **No**

3. May we contact you for further information if necessary? If so, please provide your name and telephone number.

Name Kevin Rakow - GM

Telephone Number 218-444-7708 DAY or EVENING (please circle one and state best time to reach you)

Please complete this form and mail it back to Delta in the enclosed self-addressed stamped envelope. Delta thanks you in advance for taking the time to complete this form.

If you have any questions, or need help completing this form, please feel free to contact Nancy Rodning, Delta Consultants, at (651)697-5152 or 1-800-477-7411, or Nile Fellows, MPCA, at 651-757-2352.

Not the Holiday Inn.

Receptor Survey Questionnaire

PROPERTY ADDRESS: 12205 River Ridge Blvd - Northern Tool & Equip

1. Is there, or has there ever been, a water well on the property? **Yes** (**No**) **Unknown**

If you answered **No or Unknown**, proceed to Question 2. No evidence of any

1a. If you answered **Yes**, is the well *active* (in use), *abandoned* (not in use), or *sealed* (decommissioned following Minnesota Department of Health [MDH] Well Code guidelines).

_____ACTIVE _____ABANDONED _____SEALED

1b. How deep is (was) the well? _____FEET (if depth is unknown check here _____)

1c. In what year was the well installed (if known)? _____

1d. If the well was abandoned, what year was the well sealed?_____

3e. If the well is active, for what purpose is it used? Example: (drinking water, lawn sprinkler, cooling, etc.)_____

_____

1f. Where on the property is (was) the well located?_____

_____

_____

1g. If there is currently a water supply well on the property, would you grant access to the property in order to obtain a water sample from either an indoor or outside faucet (at no cost to property owner)?

Yes **No**

Name_____

Telephone Number_____DAY or EVENING (please circle one and state best time to reach you)

2. Is a public water supply currently utilized by the property? (**Yes**) **No**

3. May we contact you for further information if necessary? If so, please provide your name and telephone number.

Name Store Manager

Telephone Number_____DAY or EVENING (please circle one and state best time to reach you)

Please complete this form and mail it back to Delta in the enclosed self-addressed stamped envelope. Delta thanks you in advance for taking the time to complete this form.

If you have any questions, or need help completing this form, please feel free to contact Nancy Rodning, Delta Consultants, at (651)697-5152 or 1-800-477-7411, or Nile Fellows, MPCA, at 651-757-2352.

Receptor Survey Questionnaire

via telephone 11-2-10

PROPERTY ADDRESS: 11825 Hwy 23

1. Is there, or has there ever been, a water well on the property? **(Yes)** **No** **Unknown**

If you answered **No or Unknown**, proceed to Question 2.

1a. If you answered **Yes**, is the well *active* (in use), *abandoned* (not in use), or *sealed* (decommissioned following Minnesota Department of Health [MDH] Well Code guidelines).

_____ACTIVE _____ABANDONED _____SEALED

1b. How deep is (was) the well? _____FEET (if depth is unknown check here _____)

1c. In what year was the well installed (if known)? _____

1d. If the well was abandoned, what year was the well sealed?_____

3e. If the well is active, for what purpose is it used? Example: (drinking water, lawn sprinkler, cooling, etc.)_____ All domestic

1f. Where on the property is (was) the well located?_____

1g. If there is currently a water supply well on the property, would you grant access to the property in order to obtain a water sample from either an indoor or outside faucet (at no cost to property owner)?

(Yes) **No**

Name Bob Fspenson

Telephone Number 218-626-2746 DAY or EVENING (please circle one and state best time to reach you)
218-393-4966

2. Is a public water supply currently utilized by the property? **Yes** **(No)**

3. May we contact you for further information if necessary? If so, please provide your name and telephone number.

Name_____

Telephone Number_____DAY or EVENING (please circle one and state best time to reach you)

Please complete this form and mail it back to Delta in the enclosed self-addressed stamped envelope. Delta thanks you in advance for taking the time to complete this form.

If you have any questions, or need help completing this form, please contact Nancy Rodning, Delta Consultants, at (651)697-5152 or 1-800-477-7411, or MPCA Project Manager Nile Fellows at 651-757-2352.

Receptor Survey Questionnaire - via telephone 10-26-10

PROPERTY ADDRESS: 10401 Hwy 23

1. Is there, or has there ever been, a water well on the property? (Yes) No Unknown

If you answered **No or Unknown**, proceed to Question 2.

Notes:
All samples were analyzed by Axys Analytical Services LTD of British Columbia, Canada.
Sediment results and standards are in nanograms per gram (ng/g), which is approximately equivalent to parts-per-billion.
Surface water and well water results and water standards are in nanograms per liter (ng/L), which is approximately equivalent to parts-per-trillion.
Non-detect results are expressed as "less than" the laboratory detection limit.
Bolded type indicates detection above the laboratory method detection limit.
Tier 1 Residential SRV: Minnesota soil reference value for chronic human exposure in a residential setting.
Tier 2 Recreational SRV: Minnesota soil reference value for exposure in a recreational setting.
Tier 2 Industrial SRV: Minnesota soil reference value for exposure in an industrial setting.
PFC compounds soil results reported on a dry weight basis.
(1) Health-Based Value (HBV) for chronic exposure defined by the Minnesota Department of Health.
(2) Health Risk Limit (HRL) for drinking water defined by the Minnesota Department of Health.
(3) Risk Assessment Advise (RAA) set by the Minnesota Department of Health for PFHxS does not specify numeric values.
ND: No State or Federal values or limits defined.
(D) Dilution performed on sample by laboratory.

Hidden Harbor Marina Well Location Map

Hidden Harbor Marina Water Supply Wells

Well A	Located in the marina workshop, used for non-potable uses. Unique Well #268354.
Well B	Located in the parking lot north of the restaurant/bar. Restaurant/bar and marina docks connected to this well. Unique Well #559256
Well C	Located in backyard of marina house. This house is currently being used as the shower house for use by marina customers. Unique Well # unknown.
Well D	Located in the crawl space of the house at 1001 Oak Street. Unique Well # unknown.
Well E	Located in the house basement at 115 10th Avenue West. Unique Well #429870

Table of Contents

List of Tables

List of Figures

All figures for a specific chapter are located at the end of the chapter.

Executive Summary

The St. Paul Downtown Airport, also known as Holman Field, is one of seven airports owned and operated by the Metropolitan Airports Commission (MAC). The airport identifier, or reference code, is STP. Holman Field has played an important role in the Twin Cities since the City of St. Paul opened the airport in 1926. Located just five minutes from the St. Paul business center and 15 minutes from downtown Minneapolis, STP is considered by the MAC to be the primary reliever airport for the Minneapolis – St. Paul International Airport (MSP). In a 2005 economic report prepared by MAC, its contribution to the local economy has been estimated to be more than $112 million annually.

This comprehensive planning document serves as a frame work for future development activity at the airport. This report follows guidelines set forth by the Federal Aviation Administration (FAA) and the Metropolitan Council. The last long term plan for STP was completed in 1992. Since that time, MAC has completed environmental reviews and implemented recommendations from that plan.

ES.1 Report Organization

This report is organized into the following chapters:

1. Existing Conditions / Inventory
2. Aviation Forecasts
3. Airside and Landside Facility Requirements
4. Plan Recommendations
5. Environmental Considerations
6. Land Use Compatibility
7. Capital Improvement Program Costs
8. Facility Implementation Schedule
9. Public Information Process

The inventory of existing conditions is used to establish a baseline of facilities and services available at the airport. The forecasts are used to determine the type of activity likely to occur at the airport and at what projected levels. Facility requirements use the forecasts to determine what facilities will be required to support the level of activity indicated by the forecast. The projected facility needs are compared to the existing infrastructure to determine if additional facilities at the airport will be needed in the future.

The plan recommendations chapter identifies improvements considered for the airport. The environmental considerations and land use sections discuss the existing conditions and plan recommendations in relation to environmental issues, such as noise, and surrounding land use compatibility.

The last sections identify the plan recommendation costs and the proposed timeline for implementation. The final section outlines the public information program that was followed, and summarizes any comments received during the document development process.

ES.2 Forecasts

This document includes aviation forecasts for based aircraft and the projected number of operations for STP. Forecasts are presented for an approximate 20-year time horizon, and include 2010, 2015, 2020, and 2025 as noted in Table ES-1. The forecasts are unconstrained and assume that the necessary facilities will be in place to accommodate demand.

Table ES-1
Forecast Summary

Year	Baseline	High Forecast	Low Forecast
		OPERATIONS	
2007	125,254	125,254	125,254
2010	111,870	133,953	85,858
2015	117,399	149,365	95,934
2020	130,056	156,458	103,613
2025	137,310	156,431	112,869
		BASED AIRCRAFT	
2007	93	93	93
2010	105	105	102
2015	117	125	112
2020	128	132	115
2025	132	132	120

Source: Aviation Forecasts – Technical Report, April 2009

The existing and projected economic conditions in the area and current general aviation activity are used to prepare the assumptions that form the foundation of the forecasts. Based aircraft forecasts for the MAC-owned airports are calculated and then allocated among the individual airports. Operations and peak activity forecasts for STP are derived from the based aircraft forecasts. The analysis also includes a set of high and low activity scenarios for the airport in addition to the baseline forecasts.

The assumptions inherent in the forecasts are based on data provided by the MAC, federal and local sources, and professional experience. Fuel cost assumptions reflect the recent major increase in oil prices. Forecasting, however, is not an exact science. Departures from forecast levels in the local and national economy and in the aviation industry will have an effect on the forecasts presented herein.

A copy of the full Activity Forecasts - Technical Report is contained in Appendix A of this document.

ES.3 Facility Requirements

The current aircraft approach category assigned to Runway 14-32 at the Airport is “D”. Typical aircraft in this aircraft approach category include business jets such as the Gulfstream V. Both Runways 13-31 and 9-27 are assigned aircraft approach category “B”. Runway 13-31 is designed for aircraft over 12,500 pounds maximum gross take-off weight. Typical aircraft in this approach category and weight include small business jets such as the Cessna Citation III. Runway 9-27 is designed for aircraft less than 12,500 pounds. Typical aircraft in this category are single-engine and twin-engine piston and few turboprops such as the Raytheon Beechcraft King Air B200 and smaller.

The current airplane design group applied to Runway 14-32 is Group III. This means that the runway is designed to accommodate aircraft with wingspans less than 118 feet. Aircraft that fall into this category include most single-engine and twin-piston aircraft, turbo props and business jets. Runways 13-31 and 9-27 can accommodate airplane design Group II aircraft. Group II includes the Raytheon Beechcraft King Air B200 and smaller regional and corporate jets such as the Cessna Citation I, II and III and Gulfstream I.

Airfield capacity is defined as the maximum number of operations that can be accommodated by a particular airfield configuration during a specified interval of time when there is constant demand. Annual service volume (ASV) is one capacity measure and the average hourly capacity is another.

St. Paul Downtown Airport's ASV is currently calculated to be 265,000, which is well above its current and 2025 projected annual operations of 125,254 and 137,310 respectively. It is also well above the high scenario 2025 year forecast of 156,431 annual operations. STP has adequate runway capacity to support all of the forecast scenarios. This means that runway capacity will not be a contributing factor to any airport improvements.

The facility requirements indicate the recommended runway length for the largest critical aircraft is 7,300 feet, and for the group of aircraft weighing more than 60,000 pounds, it is 6,620 feet. For smaller aircraft using STP, a runway length of 3,810 feet is recommended. Runway 14-32 is 6,491-feet, which is only 129 feet short of the recommended 6,620 feet. Runway 13-31 already exceeds the recommendation by 104 feet for small aircraft less than 12,500 pounds. Runway 9-27 is short of the recommended 3,810 feet by 168 feet. The runway safety improvements recently completed required the reduction of runway length for each of the three runways in order to obtain the required runway safety area length. It is not possible to extend the runways given the physical location of the river and the required safety area criteria. Therefore, STP cannot meet the FAA-recommended runway lengths to accommodate 100 percent of the aircraft that fall into the approach categories.

According to the forecasts, the number of based aircraft is anticipated to gradually rise from 93 in 2007 to 132 in the year 2025. The south hangar area expansion was completed in 2000, and still has large corporate hangar sites available. MAC also completed the "Mercury Avenue" hangar area in 2002 on the east side of the airport. It has four small aircraft hangar sites and a site for an 8-aircraft T-hangar still available. With a forecasted growth to132 aircraft by 2025, the airport has enough hangar space to meet the forecasted demand.

It should be noted that if the demand for hangar space begins to exceed the current capacity, it is possible to consider redevelopment in some areas; but for the most part, there is no additional space at the airport for any new hangar areas. It should also be noted that hangar construction in the Mercury Avenue area or anywhere along Bayfield Street on the east side of the airport is subject to specific floodway/floodplain development and construction requirements.

ES.4 Plan Recommendations

As discussed above, there is no demonstrated need for additional runways, runway extensions or new hangar areas at STP at this time. There are, however, various airside and landside improvements that are recommended for implementation. They are itemized below and shown on Figure ES-1. Estimated costs and implementation timelines are listed in Table ES-2.

ES.4.1 Pavement Maintenance Program

It is recommended that MAC continue pavement reconstruction and rehabilitation as part of the on-going pavement maintenance program. For STP, MAC typically carries separate items in the capital improvement program for pavement maintenance. One line item includes pavement rehabilitation or reconstruction proposed for the seven-year program, for which costs are based on specific project locations. The second line item is an on-going every-other-year joint and crack repair item. Given the poor soils and saturation at STP, the pavements tend to move more which results in a more frequent need for repairs.

ES.4.2 Terminal Sub Drain

As discussed in Chapter 3, this project is recommended to improve the drainage around the exterior basement of the administration building. The improved drainage will alleviate subsurface soil and water pressures put on the basement walls during flood conditions.

ES.4.3 Electrical Vault Improvements

Also identified in Chapter 3, upgrades to the electrical vault building are recommended to bring the facility into code compliance. The recommended project includes a new building, HVAC, control panels, regulators, switchgears, etc.

ES.4.4 Floodwall Maintenance

It is recommended that MAC continue to discuss and plan for the on-going maintenance, training, personnel/resources, compensatory excavation monitoring, and review any possible permit requirements for the floodwall.

ES.4.5 Concurrent Use / Development Parcels

It is recommended that MAC continue to research the potential development of concurrent land uses for revenue generating purposes on airport property. There is only one parcel that has been identified to date for this type development. It is located on the cul-de-sac of Ridder Circle on the north end of the airport, adjacent to the Pioneer Press facility. It is shown as Parcel 1R on Figure 1-4, and is highlighted in Figure 4-1.

ES.4.6 Agency Coordination

It is recommended that MAC continue cooperation with the cities surrounding the airport through the existing Downtown Airport Advisory Commission, Joint Airport Zoning Board, and on-going MAC/City staff interaction.

Table ES-2
LTCP Recommendations – Estimated Costs and Timeline

Recommendation	Estimated Cost	Timeline
On-going pavement maintenance and replacement program*	$4,400,000	Continuous throughout planning period
Terminal Sub Drain	$600,000	0 – 5 Years
Electrical Vault Improvements	$700,000	0 – 5 Years
On-going Pavement Joint and Crack Repairs	$100,000 every other year	Continuous throughout planning period
On-going MAC Building Maintenance	$200,000 every other year	Continuous throughout planning period
Concurrent Use / Development Parcels	$0 (developer cost)	0 – 10 Years

* These cost estimates are taken from the previous comprehensive plan. No preliminary engineering has been completed and these projects are not included in MAC's Capital Improvement Program. Project cost estimates will be completed if these projects become necessary, and will include estimated costs for any mitigation identified as part of an environmental assessment.

ES.5 Noise Contours and Land Use

The noise contours presented in this document were developed using INM Version 7.0a. The contours represent predicted levels, or noise contours, of equal aircraft noise exposure on the ground as expressed in DNL. The FAA currently suggests that three different DNL levels (65, 70, and 75 DNL) be modeled. The Metropolitan Council suggests that the 60 DNL contour be included for airports in an urban environment. The methodology utilized the following data: aircraft activity levels, fleet mix, day/night split of operations, flight tracks and runway use.

In the Baseline 2007 noise contours, there are 132 single-family homes and 160 multi-family units located in the 60 DNL contour around St. Paul Downtown Airport. The 60 DNL contour contains approximately 2.14 square miles. The 65 DNL contour contains approximately 0.86 square miles with no residential dwellings in the contour. The 2007 70 and 75 DNL contours contain 0.42 and 0.20 square miles respectively with no residential dwellings in the contours.

The Forecast 2025 noise contours around St. Paul Downtown Airport increase to approximately 2.94 square miles in the 60 DNL contour and approximately 1.09 square miles in the 65 DNL contour. The residential structures within the 60 DNL contour increase to 498 single family homes and 666 multi-family units and no residential units are contained in the 65 DNL and greater contours. The 70 and 75 DNL contours increase to cover 0.52 square miles and 0.26 square miles, respectively.

In summary, there will be a 37.4 percent increase in the 60 DNL contour with an increase of 366 single family homes and 506 multi-family units in the contour. The area within the 65 DNL contour increases 26.7 percent over the same period. The increase in the contours can be attributed primarily to a 9.6 percent increase in total aircraft operations from 2007 to 2025 and a 71.7 percent increase in jet aircraft operations (not including very light jets/microjets).

Planning for the maintenance and development of airport facilities is a complex process. Successfully developing airports requires pragmatic decision-making predicated on various facts that drive the need for the development of additional airport infrastructure. Furthermore, these efforts need to consider surrounding community land uses. Airports cannot be developed in a vacuum; the development effort must consider the needs of the surrounding populations and the land uses in the area surrounding the airport. The success of airport planning is predicated on close consideration and coordination of surrounding land use to ensure compatibility with the community surrounding the airport.

The Metropolitan Council has developed a set of land-use planning guidelines for responsible community development in the Minneapolis-St. Paul Metropolitan Area. The intent is to provide city governments with a comprehensive resource with regard to planning community development in a manner that considers adequacy, quality and environmental elements of planned land-uses.

The State of Minnesota Department of Transportation (Mn/DOT) has established regulations that control the type of development allowed off runway ends in order to prevent incompatible development. These guidelines should be used to establish zoning ordinances to protect areas around an airport. The states zoning areas overlay and extend beyond the RPZs. The most restrictive areas created by Mn/DOT regulations are called State Safety Zones A and B. The safety zones should exist off each runway end and follow the approach zones out to the total length of the runway. As defined by Mn/DOT, the typical length of Safety Zone A is 2/3 of the total runway length; Safety Zone B is 1/3 of the total runway length and extends from Safety Zone A. There is also an area called Safety Zone C which is circular and typically follows the FAA FAR Part 77 horizontal surface.

The St. Paul Downtown Airport is located in Ramsey County, in the City of St. Paul. The airport is bordered by the Mississippi River to the north, south and east and a combination of mixed use commercial, office and industrial/utility land uses to the west. Residential land uses are located northeast and southwest of the airport. The communities of West St. Paul and South St. Paul are located immediately to the south of the airport. In May 2008, a Joint Airport Zoning Board (JAZB) was convened which includes representation from the respective Responsible Governmental Units (RGUs) that control land use development around the St. Paul Downtown Airport. This effort is addressing land uses around St. Paul Downtown Airport in the context of the runway approach zones and may result in modification to the safety zone dimensions and development restrictions outlined in Chapter 6.

The goal of the JAZB is to develop a St. Paul Downtown Airport Zoning Ordinance for review and approval by the Commissioner of Transportation, for subsequent adoption by the Board and then by local municipalities. The Board will determine if the state model zoning ordinance provisions are appropriate for the St. Paul Downtown Airport or if modifications to the model are necessary considering the provisions of Minn. Stat. §360.066, subd. 1. The focus of this discussion has been on the following:

- MnDOT Model Ordinance – Minnesota Rule 8800.2100 and Minnesota Rule 8800.2400 (additional information on the MnDOT Model Zoning Ordinance is available on the Internet at http://www.dot.state.mn.us/aero/avoffice/planning/zoning.html)

- St. Paul Downtown Airport unique characteristics in the context of existing and planned land uses around the airport

- Maintaining a “reasonable standard of safety” while considering the social and financial costs to the community

- Minn. Stat. §360.066, subd. 1, which is especially instructive when addressing the question of balancing the safety with the social and economic impacts in the zoning process.

It is anticipated that a proposed final St. Paul Downtown Airport Zoning Ordinance will be submitted to the Commissioner of Transportation for final approval in 2010.

ES.6 Public Involvement Process

At the onset of this long-term comprehensive plan update process, a public involvement program was developed. It included a specific plan for group meetings, with whom and when. The purpose of the meetings was to inform the airport users and the public about the process and schedule, and offer an opportunity for personal question-and-answer sessions. The goal was to receive informal input as the process advanced, and prior to the formal public comment period that took place upon completion of the full draft document. In addition, MAC held two meetings and corresponded regularly with a technical advisory group, made up of members of MAC staff, the FAA, Mn/DOT Aeronautics, and Metropolitan Council.

Informal comments were accepted at all meetings. The MAC committee meetings were open to the public, and verbal comments were invited at each of them. Meetings with the Downtown Airport Advisory Commission (DAAC) typically involved a short presentation by MAC staff followed by a question and answer period.

During the long-term comprehensive planning drafting process, MAC requested informal written or verbal comments regarding the LTCP Update. Advertisement for the MAC public open house meeting was published in the *Pioneer Press* on June 10, 2009. The meeting was held on June 23, 2009. Not one person attended the public meeting. As of December 2009, MAC had received zero written comments.

The draft LTCP document was completed in December, 2009, and made available for a 30-day written comment period starting December 14, 2009. The comment period ended on January 12, 2010. Advertisements for the 30-day public written comment period on the draft LTCP were published in the *Pioneer Press* and *Star Tribune* newspapers on December 10, 2009.

Upon completion of the written comment period, MAC received two letters. One letter submitted came from the West Side Citizens Organization, and the second letter came from a resident of St. Paul. The letters and MAC's responses to them are included in Appendix B.

In February 2010, MAC submitted the draft LTCP document, along with all written comments received and MAC responses to those comments, to the Metropolitan Council for their review. The Metropolitan Council issued their determination in April 2010, finding the LTCP Update consistent with the Metropolitan Council's development guide. Correspondence from the Metropolitan Council has been included in Appendix B.

In June 2010, the Commission took action to adopt this LTCP as the final plan. MAC is committed to preparing updates to this LTCP on a regular basis.

Chapter

1 Existing Conditions/Inventory

1.1 Airport History and Location

The St. Paul Downtown Airport, also known as Holman Field, is one of seven airports owned and operated by the Metropolitan Airports Commission (MAC). See Figure 1-1. The airport identifier, or reference code, is STP. Holman Field has played an important role in the Twin Cities since the City of St. Paul opened the airport in 1926. Located just five minutes from the St. Paul business center and 15 minutes from downtown Minneapolis, Holman Field is considered by the MAC to be the primary reliever airport for the Minneapolis – St. Paul International Airport (MSP). In a 2005 economic report prepared by MAC, its contribution to the local economy has been estimated to be more than $112 million annually.

The airport is located in Ramsey County, two miles southeast of downtown St. Paul, nine miles east/northeast of the Minneapolis – St. Paul International Airport (MSP), and just over 10 miles southeast of downtown Minneapolis. See Figures 1-2 and 1-3.The airport can be accessed from Trunk Highway 52 and Plato Boulevard. The airport lies just south of Interstate 94 and east of Interstate 35E. The airport sits adjacent to the Mississippi River, which borders the airfield on the north, east and south sides. The west side of the airport is bounded by a railroad and the U.S. Army Corps of Engineers flood control levy. Interior airport access roads include Bayfield Street, Airport Road, and Eaton Street.

The St. Paul Downtown Airport consists of 576 acres. Of that, MAC owns 192 acres. The largest airport parcel makes up the entire northern half of the airport and is approximately 383 acres in size. It is owned in fee title by the City of St. Paul. By statutory right (Minnesota Statute § 473.621), MAC operates and maintains the airport and has jurisdiction to exercise powers with reference to airport property, except for disposal of fee title. In addition to the airfield and approach area properties, MAC also has numerous avigation easements on surrounding properties that limit or restrict land use and/or certain types of development, structures, trees, drainage facilities, etc. In total, MAC holds 96 acres in avigation easements. See Figure 1-4 for the most recent Airport Property Inventory Map.

The first grass strip at STP appeared in 1926. Since then, the airport has seen major modifications, including longer paved runways, expanded and improved hangar facilities, and the dedication of a new air traffic control tower in 2000. In addition, MAC has moved forward with a major floodwall construction project to protect the airport during certain flood events. Now complete, the floodwall will allow for the airport to remain open during flood events, albeit at a reduced runway length. However, protecting the airport and allowing operations will significantly reduce the need for tenants to relocate or the need for the airport to close when waters rise on the Mississippi River.

The military has had a presence at the airport since 1942, and the Minnesota Army National Guard continues to operate a facility at STP. Table 1-1 contains other historical notes as well as major construction items. In addition to these projects, MAC has on-going rehabilitation programs for all of the airfield and perimeter road pavements and the administration building.

There have been a number of previous airport studies completed for the airport. The Metropolitan Council prepared the 1986 *Metropolitan Airports System Plan* and the *Metropolitan Development Guide Aviation Policy Plan*, which was first adopted in 1972. The most recent update to the Policy Plan occurred in January 2009, and was called the 2030 Transportation Policy Plan. MAC prepared the first Master Plan for STP in 1977, which included recommendations for a new runway with a precision instrument approach. In 1983, an Environmental Impact Statement (EIS) was completed for the recommended runway and building area improvements.

Table 1-1
Airfield Development Timeline

Year	Project Description
1926	City of St. Paul acquires property for the Saint Paul Municipal Airport.
1926	First runway constructed (turf) at 3,000 feet.
1928	Two asphalt runways constructed; one east/west at 1,500 feet and one northwest/southeast at 2,000 feet.
1930	First hangar built.
1930	Ordinance enacted to define airport boundary and define obstructions.
1931	Airport renamed Holman Field, in honor of Charles W. (Speed) Holman.
1936	Airfield reconstructed with four paved runways, taxiways (see Figure 1-5).
1936 - 1940	Administration Building, Old Municipal Hangar, Northwest Airlines Hangar built.
1942	U.S. Army Corps takes control of airport; use it as a depot for the modification of B-24 “Liberator” heavy bombers.
1942	Riverside Hangar built.
1943	Metropolitan Airports Commission created.
1945	MAC assumes ownership of the airport.
1960	Northwest Airlines moves to Wold Chamberlain Field (MSP).
1961	Airport name changed to St. Paul Downtown Airport – Holman Field.
1965	Airport closed for 31 days due to flooding.
1969	Airport closed for 31 days due to flooding.
1984 - 1987	Runway 14-32 constructed, south hangar area first phase construction.
1991	Improvements made to the Riverside hangar.
1993	Airport closed for 35 days due to flooding.
1996	Mounds Park Airway Beacon Restoration (see Figure 1-7).
1997	Airport closed for 35 days due to flooding.
1997	Runway 14 ILS Installation.
1998	East Building Area Sanitary Sewer and Water Installation.
1998	Floatplane Harbor officially deactivated
1998 - 2000	South Hangar Area Expansion.
1998 - 1999	FAA constructs new Air Traffic Control Tower.
1999	Runways are renumbered to 14-32, 13-32 and 9-27 due to changes in magnetic declination.
2001	Airport closed for 78 days due to flooding.
2000 - 2001	Eaton Street dike constructed to prevent backwater during floods.
2005	Airfield Subdrain Improvements completed.
2006	Compensatory Excavation as prelude to floodwall construction.
2006 - 2008	Runway safety area improvements completed for all three runways, including EMAS for both ends of Runway 14-32.
2007 - 2008	Perimeter floodwall construction.

In 1992, MAC updated the long-term comprehensive plan/master plan for the airport. That plan update recommended lead-in lights be installed for Runway 32, an instrument landing system (ILS) be installed for Runway 14, and that a designated helicopter landing and takeoff area be established. In addition, the plan suggested a new air traffic control tower, taxiway modifications, a compass calibration pad, and an airport-only vehicle service road. To date, the Runway 14 ILS has been installed, and the air traffic control tower was relocated. Other recommendations have not been implemented for various reasons. Helicopter traffic declined after the U.S. Army Reserve facility was closed in 1996, alleviating the need for a designated heliport location. A vehicle service road is not feasible given site constraints due to the river. It has also been determined that most airport users can utilize the compass calibration pad at the Anoka County – Blaine Airport or the Lake Elmo Airport.

1.2 Airport Role

The definition or "classification" for an airport differs slightly between the MAC, Federal Aviation Administration (FAA), Minnesota Department of Transportation – Aeronautics (Mn/DOT), and the Metropolitan Council.

1.2.1 MAC Classification

As noted above, MAC considers STP to be the primary reliever airport for the Minneapolis – St. Paul International Airport (MSP). In January 2006, MAC accepted the *Recommendations Regarding the Future Operation and Development of the Reliever Airport System* prepared by the MAC Reliever Airports Task Force. That document recommends the St. Paul Downtown Airport be developed as a primary corporate Reliever Airport, along with Flying Cloud Airport and the Anoka County – Blaine Airport, to enhance and support their ability to relieve corporate traffic at MSP. The other three reliever airports, Airlake, Lake Elmo and Crystal, are labeled as "complimentary relievers" in the MAC-owned seven airport system and should continue to serve as general aviation airports with some business jet traffic.

1.2.2 FAA Classification

According to the FAA, airport classification is based on the size and type of aircraft served by the airport and specific characteristics for those planes. STP has an Airport Reference Code of D-III. This means it is designed, constructed and maintained to serve airplanes in that same Airplane Design Group (ADG). The "D" references the aircraft approach category, and includes airplanes with an approach speed of 141 knots or more but less than 166 knots. The "III" relates to the airplane design group with wingspans from 79 feet up to but not including 118 feet. The FAA also names STP as one of the reliever airports to MSP.

Beginning in 1974, STP held a limited FAA Part 139 certificate which allowed for scheduled air service for airplanes carrying fewer than 30 people, and unscheduled operations for larger air carrier aircraft. Since no users have operated or requested new scheduled air service in many years, MAC no longer holds the certificate.

1.2.3 Mn/DOT Classification

Mn/DOT classifies the St. Paul Downtown Airport as a Key System Airport. This means it has a paved runway over 5,000 feet, and is capable of accommodating all single-engine, twin-engine, and most corporate jet aircraft.

1.2.4 Metropolitan Council Classification

The Metropolitan Council classifies the St. Paul Downtown Airport as an Intermediate Airport. Under this definition, the airport has a primary runway length between 5,001 feet and 8,000 feet, with precision approach capability. The airport can accommodate regional/commuter flights, air taxi, corporate/business, general aviation, flight training, personal use and recreational aircraft, and military operations (see Table 1-2).

Table 1-2
Functional and Operational Characteristics of Metropolitan Airport Facilities

Airport Type	System Role	Airport Users	Primary Runway Length	Primary Rwy Instrumen-tation	MAC-Owned
Major	Scheduled Air Service • Minneapolis-St. Paul International	Air Carriers Regional/Commuter Passenger & Cargo Charters Air Cargo Air Taxi Corporate G.A. Military	8,000 feet or more	Precision	Yes
Intermediate	Primary Reliever • St. Paul Downtown	Regional/Commuter Air Taxi Corporate/Business General Aviation Flight Training Personal Use / Recreational Military	5,000 feet to 8,000 feet	Precision	Yes
Minor	Secondary Reliever • Airlake • Anoka County – Blaine • Crystal • Flying Cloud • Lake Elmo • South St. Paul	Air Taxi Business G.A. Flight Training Personal Use / Recreational Military	2,500 feet to 5,000 feet	Precision or Non-Precision	Yes Yes Yes Yes Yes No
Special Purpose	Special Uses • Forest Lake • Rice Lake • Wipline, IGH	All general aviation (grass strip) (seaplane) (seaplane)	Varies	Visual	No No No

Source: Metropolitan Council Aviation Policy Plan, December 1996.

1.3 Existing Airside Facilities

Airside facilities include the operational aircraft areas of runways, taxiways, and aprons. These are areas where vehicular traffic is generally not allowed due to safety concerns related to mixing with aircraft. Airside facilities also include airfield lighting and navigational aids.

1.3.1 Pavement Areas

STP consists of three runways and numerous taxiways. The runways, with their current lengths as of 2008 after the runway safety area improvement projects, are listed in Table 1-3. The taxiway designations are shown in the Airport Diagram, in Figure 1-6.

Most of the airfield pavements are asphalt. They vary in pavement age, thickness and typical section. Over time, pavement overlays, rehabilitation, reconstruction and/or crack repair methods have changed the characteristics of the pavement from section to section. The apron areas in the south hangar area were constructed in 1999 with concrete. A portion of the airport leased by the 3M Company also contains areas made of concrete. Other apron areas at the airport are asphalt.

Table 1-3
Runway/Airfield Data

	14-32	13-31	9-27
Design Critical Aircraft	Gulfstream V	Cessna Citation III	King Air B200
Runway Length (ft)	6,491	4,004	3,642
Runway Width (ft)	150	150	100
Runway Surface	Asphalt	Asphalt	Asphalt
Threshold Location	Displaced (14 & 32)	—	—
Runway Load Bearing Strength (lbs)			
Single Wheel Loading (SWL)	75,000	75,000	12,500
Dual Wheel Loading (DWL)	100,000	100,000	—
Runway Lights	HIRL	HIRL	MIRL
Taxiway Lights	MITL	MITL	MITL
Runway Markings	Precision Instrument	Non-Precision Instrument	Non-Precision Instrument
Visual Approach Aids	MALSR (14) PAPI (14 & 32) REIL (14 & 32)	PAPI (13 & 31) REIL (31)	PAPI (27)
Instrument Approach Procedures	ILS (14 & 32) RNAV GPS (14 & 32) Copter ILS or LOC (32)	NDB (31)	—
Other	Air Traffic Control Tower, ASOS, Lighted Windcone, Lighted Beacon, Airway Beacon		

1.3.2 Lighting and Navigation

Navigational aids (NAVAIDS) and lighting are intended to guide pilots from point to point, increase the visibility of runway features, and control runway activity both on the ground and in the air. Runway and taxiway lighting consist of light fixtures placed near the pavement edge to help identify the limits. This lighting is essential for safe nighttime operations and during periods of low visibility.

Runway 14-32 and 13-31 are lighted with High Intensity Runway Edge Lights (HIRLs) and Runway 9-27 has Medium Intensity Runway Edge Lights (MIRLs). All taxiways are equipped with Medium Intensity Taxiway Lights (MITLs). The intensity of the runway and taxiway lighting can be controlled by air traffic control personnel. When the Air Traffic Control Tower (ATCT) is closed, pilots can turn on and change the intensity of the lights for Runway 14-32 by using the radio transmitter in the aircraft. Runway 13-31 and 9-27 are lighted at night but not radio controlled.

Runways 31 and 32 have runway end identifier lights (REILs). REILs are synchronized flashing lights to help pilots visually acquire the runway end as they approach for landing. Runways 14, 32, 13, 31 and 27 have precision approach path indicators (PAPIs). The PAPI system uses a combination of red and white lights only visible at certain angles that help pilots determine appropriate angles of descent during landings. Runway 14 is also equipped with a Medium Intensity Approach Lighting System with Runway Alignment Indicator lights (MALSR).

There are two Non-Directional Beacons (NDB) located near the airport. Hopey is approximately 6.2 nautical miles (NM) from the airport and the second, Narco ,is approximately 6.7 NM from the field. An NDB transmits radio signals on a designated frequency. This information provides a tool for pilots to navigate within the National Airspace System (NAS). This is particularly useful for low altitude airway vectoring. The signals follow the curvature of the earth so NDB signals can be received at much greater distances at lower altitudes than other systems. However, the NDB signal is affected more by atmospheric conditions, mountainous terrain, coastal refraction and electrical storms, particularly at long range.

In addition to providing navigational assistance to aircraft, NDBs also allow for non-precision approaches, thereby enhancing the capability of the airport. St. Paul Downtown Airport has three non-precision instrument approaches, an NDB approach to Runway 31 and RNAV (GPS) approaches to Runways 14 and 32. There are no on-site navigational aids associated with the RNAV (GPS) approach.

There are two precision instrument approaches at the airport. Navigation aids for these systems include a glide slope and localizer with distance measuring equipment (DME) for each approach. Runway 14 has an Instrument Landing System (ILS) approach with ¾ mile visibility minimums. Runway 32 has an ILS approach with 1 mile visibility minimums. There is also a published precision instrument approach procedure for helicopters with visibility minimums of ½ mile.

The airfield has a lighted airfield beacon, a lighted windcone and a wind tee.

1.3.3 Airway Beacon

In addition to the NAVAIDs listed above, the St. Paul Downtown Airport is also home to the last remaining operational Airway Beacon in the nation (see Figure 1-7). This beacon, located in Mounds Park above the airport on the river bluff, was part of a system of beacons that lighted nighttime airway corridors across the United States. This beacon in particular was a part of the route between St. Paul and Chicago. The airway beacons were primarily used by mail carriers operating around the clock. Radio navigation was being developed in the 1920s and by the mid-1950's VHF and VOR airways were in place. By the mid 1970s, the airway beacon system was no longer being used and was shut down.

The City of St. Paul's Bureau of Bridges designed the beacon, which was originally constructed in 1929. The tower is approximately 110-feet tall, with the 24-inch diameter beacon sitting atop the structure. The beacon light beam flashes in the original historic airway beacon colors: both sides flash white (as compared to a typical airport beacon that flashed one side white and one side green). At some point, the original black and yellow colors on the tower structure were replaced with the typical FAA orange and white colors. In 1995, the beacon was refurbished through a cooperative effort between MAC, the FAA, the State Historic Preservation Office (SHPO), the Indian Affairs Council, the Minnesota State Archeologist, and the City of St. Paul. During the refurbishment, the original black and yellow colors of the tower were restored.

1.3.4 Airspace Management System

The airspace around the airport is defined by FAA classification, air traffic control designation, navigational aids (NAVAIDS), other surrounding airports, and flight rules specific to the St. Paul Downtown Airport. The Federal Aviation Act of 1958 gave jurisdiction of all US airspace to the FAA. The National Airspace System (NAS) was established to manage this system safely and efficiently among commercial, general aviation, military and other competing users. The NAS is a common network of NAVAIDS, airport and landing sites, charting and information, procedures, regulations, technical support, and resources. Figure 1-8 shows the airports, airspace and radio aids for navigation in the vicinity of the St. Paul Downtown Airport.

1.3.5 Airspace Structure

The airspace structure is complex and requires the use of highly technical air traffic control (ATC) procedures. Airspace is either controlled or uncontrolled. Controlled airspace is managed by ground-to-air communications, NAVAIDS and air traffic services. STP is located in what is considered Class D controlled airspace when the Air Traffic Control Tower is open (6:00 am to 10:00 pm Monday through Friday and 7:00 am to 10:00 pm Saturday and Sunday) and Class E airspace during the other times. Class D airspace is under the jurisdiction of a local Air Traffic Control Tower (ATCT). (See Figure I-9). The purpose of the ATCT is to sequence arriving and departing aircraft and direct aircraft on the ground. Aircraft operating within the Class D airspace are required to maintain radio communication with the ATCT. Class D airspace is normally a circular area with a radius of five miles around the airport that extends upward from the surface to about 2,500 feet above ground level (AGL). The ceiling elevation of St. Paul's Class D airspace is 3,200 feet mean sea level (MSL) (2,495 feet above the airport elevation of 705 feet).

It should be noted that STP lies under Minneapolis/ St. Paul International Airport's (MSP) Class B Airspace which consists of controlled airspace extending upward from different floor elevations to a ceiling height of 10,000 feet MSL. There are very specific operating instructions and rules pilots must follow when flying within this airspace. St. Paul Downtown Airport lies under the area where the floor elevation of MSP's Class B airspace is 2,300 or 3,000 feet MSL (depending on the aircraft's location in the vicinity of STP). As long as pilots stay below 2,300 or 3,000 feet, they remain outside this MSP Class B airspace.

When the STP ATCT is not open, the airspace classification is Class E. Class E airspace is a general category of controlled airspace that is intended to provide air traffic service and separation for Instrument Flight Rules (IFR) aircraft from other aircraft. IFR means that the pilot is certified to fly under Instrument Meteorological Conditions (IMC) (less than three miles visibility and/or 1,000 foot ceilings). Pilots rated only for Visual Flight Rules (VFR) can operate in Class E airspace only when visibility is three statute miles and above and cloud heights are 1,000 feet AGL and higher. These pilots are not required to maintain contact with ATC. Class E is a common classification for airports without air traffic control towers (ATCTs). Class E airspace extends to 18,000 feet MSL and generally fills in the gaps between other classes of airspace in the United States.

1.3.6 Delegation of Air Traffic Control Responsibilities

STP has its own Air Traffic Control Tower (ATCT). During the times when it is open, it provides air traffic control services. When the ATCT is closed services are provided by Minneapolis Terminal Radar Approach Control (TRACON) located at Minneapolis-St. Paul International Airport, and assisted by the Flight Service Station (FSS) at Princeton, Minnesota. Aircraft operating at STP when the ATCT is closed are advised to broadcast their intentions and monitor Common Traffic Advisory Frequency (CTAF) frequency, which is also the UNICOM frequency. Pilots making instrument approaches or departures are in contact with the ATCT or Minneapolis TRACON.

1.3.7 Approach Procedures and Traffic Patterns

There are two different types of flight rules set out in FAR Part 91. Visual Flight Rules (VFR) apply in generally good weather conditions based on visibility. Instrument Flight Rules (IFR) come into play when visibility levels fall to less than three statute miles and/or cloud levels go below 1,000 feet.

For STP, the local traffic pattern altitude is 1,905 feet MSL (1,200 feet above the airport elevation). All the runways, except one follow standard left traffic pattern. Runway 27 uses right traffic pattern. The ATCT directs runway use when winds are calm (less than 5 knots).

Aircraft with IFR instrumentation can utilize established approach procedures at STP. IFR flight rules have specific departure and arrival instructions, flight routing, altitude assignment, and communication procedures that are required. As stated, IFR allows a pilot to operate in controlled airspace and operate in poor weather at appropriately-equipped airport facilities such as STP. There are two precision instrument approach

procedures and three non-precision instrument approach procedures established for St. Paul Downtown Airport. The ILS or LOC RWY 32, ILS RWY 14, RNAV (GPS) RWY 14, RNAV (GPS) RWY 32 and NDB RWY 31approaches are shown on Figures I-10 to I-14, respectively. There is also an instrument approach for helicopters, COPTER ILS RWY 32, shown on Figure I-15.

1.3.8 Imaginary Surfaces and Obstructions

FAR Part 77 is the guidance used to determine obstructions to navigational airspace. The surfaces are comprised of primary, approach, transitional, horizontal and conical three-dimensional imaginary surfaces. (See Figure 1-16) Their exact configuration varies based upon the approach type of runway. Obstructions are defined as objects that penetrate these imaginary surfaces. Mitigative measures such as obstruction lights, removal or relocation may be required for the obstruction not to be considered a hazard. All obstructions should be catalogued and their disposition noted. The Airport Layout Plan (ALP), published separately from this report, shows the location of obstructions. Critical obstructions are also shown on the approach procedures for the airport.

1.3.9 Runway Protection Zones/State Safety Zones

Runway Protection Zones (RPZs) restrict land use off runway ends to help ensure the safety of people and property on the ground. The Federal Aviation Administration (FAA) recommends that the airport own or have control over all land within the RPZs. Among the land uses prohibited in RPZs are residences and those land uses which may result in public assembly (i.e., schools, hospitals, office buildings, and shopping centers). Although the FAA prefers that RPZs be kept free of all objects, some types of development are allowed within certain portions of the RPZ (provided the development does not attract wildlife or interfere with navigational aids).

The dimensions of RPZs are determined based upon the aircraft approach category and the associated runway approach visibility minimums. According to Table 2-4 of AC 150/5300-13, Airport Design, Runway 14 falls under the approach visibility minimums category not lower than ¾ mile for all aircraft type, Runway 32 falls under visual and not lower than one mile for aircraft approach category C & D; Runways 13 and 31 fall under visual, not lower than one mile for aircraft approach category A & B; and Runways 9 and 27 fall under visual for small aircraft exclusively. The dimensions of RPZs are determined based upon the aircraft approach category and runway approach visibility minimums. For STP, the RPZ dimensions are shown in Table 1-4.

Table 1-4
Runway Protection Zone Dimensions

Runway	RPZ Dimensions (ft)
14	1,000 x 1,700 x 1,510
32	500 x 1,700 x 1,010
13	500 x 1,000 x 700
31	500 x 1,000 x 700
9	250 x 1,000 x 450
27	250 x 1,000 x 450

Dimensions are inner width x length x outer width.

The State of Minnesota Department of Transportation (Mn/DOT) has established regulations that control the type of development allowed off runway ends in order to prevent incompatible development. These guidelines should be used to establish zoning ordinances to protect areas around an airport. The typical state zoning areas overlay and extend beyond the RPZs, following the FAA FAR Part 77 approach and horizontal surfaces. The most restrictive areas created by Mn/DOT regulations are called State Safety Zones A and B. Mn/DOT prefers that airports own all of State Safety Zone A. For land within the area that is not airport-owned, land use protection is recommended by including the safety zones in local zoning codes and zoning maps. Inclusion of the safety zones on community Comprehensive Plans is also strongly encouraged.

More information on RPZs and State Safety Zones can be found in Chapter 6 - Land Use Compatibility. The RPZs and recommended State Safety Zones for STP are shown in Figure 6-1.

1.4 Existing Landside Facilities

Landside facilities include aircraft storage hangar areas, aprons, fixed base operator (FBO) areas, terminal buildings, airport maintenance equipment storage areas, roadway access to the airport, and vehicle parking areas.

1.4.1 Fixed Base Operators (FBOs)

STP currently has two fixed base operators (FBOs) open for business and one additional FBO area currently vacant. Table 1-5 indicates their airfield locations and the services they provide to their customers and clients.

Table 1-5
Fixed Base Operators

FBO Name	Airport Building Area Location	Services	Fuel Type
Avitat / St. Paul Flight Center	West	Fueling, maintenance, aircraft charter, aircraft storage and line service, aircraft rental, avionics, pilot accessory sales	Jet A 100 LL
Signature Aviation	South	Fueling, maintenance, aircraft charter, aircraft storage and line service, aircraft rental, avionics, pilot accessory sales	Jet A 100LL
Former Jet Choice Site	East	Space currently vacant	Jet A
Wings Aviation	East	Flight training, aircraft rental	N/A

Source: MAC lease documents

The FBOs provide indoor storage for aircraft. On a limited basis, they may park aircraft outside on their apron areas but generally, airplanes are housed indoors and away from Minnesota elements such as ice, snow, wind, hail, and rain. Table 1-6 outlines the estimated available indoor space for each FBO.

Table 1-6
FBO Storage Areas

FBO	Number of Indoor Spaces Available	Number of Outdoor Spaces Available
Avitat/St. Paul Flight Center	15	12
Signature Aviation	56	20
Former Jet Choice	7	0
Wings Aviation	10	0
TOTAL	88	32

Source: Estimated by MAC using visual survey and aerial photos

1.4.2 Hangar Storage Areas

The St. Paul Downtown Airport has limited hangar storage areas around the airport that are not a part of existing FBO facilities. (See Figures 1-17 through 1-20.)

The east side of the airport is what MAC calls “Mercury Avenue”. This is a relatively new hangar area, and still has space available for additional general aviation hangar construction (small in size, approximately 50 feet x 50 feet). A group of tenants cooperatively built the largest hangar which houses seven aircraft in individual stalls within one building structure. There is also space in this building area for MAC to construct an eight unit T-hangar. The 3M Company owns a large private storage hangar in this area of the airport. The twin barrel-roof hangar is known as the Riverside Hangar, and was originally built in 1942.

The west building area contains only an FBO and military operations. There is no space for individual storage hangars in this part of the airfield. The south hangar area was constructed entirely for corporate jet storage. While the FBO consumes a great deal of space here, there is existing space for additional private corporate aircraft storage.

1.4.3 Aircraft Space Utilization

Aircraft space utilization is a calculation completed to estimate the existing number of spaces on the airport that would be available for aircraft parking. This is then compared to the forecasted demand in Chapter 3 – Facility Requirements to determine if a need exists for additional hangar space at an airport.

MAC allows tenants to sublease space within their hangar if they choose. However, not all tenants do this. For hangars that are large enough to hold two or more aircraft, MAC discounted the number of available spaces by 10% to account for tenants who do not sublease extra space. MAC also assumed a 10% discount on large FBO hangars to account for any variance in operator choices for how many aircraft they house at one time. This discounting does not have a significant impact on the available number of hangar spaces, and is very reasonable given the current status of most leases at the airport today.

Table 1-7 summarizes the maximum indoor storage available, with the discounted numbers shown. Taking the military out of the equation, the maximum possible number of indoor storage spaces for civilian aircraft at STP is approximately 149. This is down from previous long-term comprehensive documents because some T-hangars were removed in 2000 to allow for the expansion of the St. Paul Flight Center FBO facility. While there is additional outdoor space available at STP, most operators will choose to store aircraft indoors for their customers for the reasons noted above in Section 1.4.1. In addition, these operators need their ramp space for maneuvering aircraft, and prefer not to clutter the ramp with parked aircraft unless absolutely necessary.

1.4.4 MAC Administration Building

The MAC-owned administration building was constructed in 1939. It houses offices, conference rooms, vending machines, and restrooms. It previously had and still maintains space for a restaurant facility. It also maintains a small but unused space for ticketing and baggage handling for scheduled passenger service. The former air traffic control tower (ATCT) was located in this facility. When the new ATCT opened across the field in 1999, the old tower cab structure was removed from the administration building.

1.4.5 Maintenance and Equipment Areas

MAC owns four maintenance and equipment storage buildings at STP. One building is located across the parking lot from the main airport terminal building. The other three buildings are located in the south hangar area near the airfield beacon. These three buildings each have a primary use: equipment and parts building, snow management materials storage, and flood wall component storage. Two of the four buildings contain office space, a break room, restrooms and shower facilities for the MAC maintenance crew.

There is a fuel farm located south of the equipment building, which contains diesel and unleaded fuel for MAC equipment. There is also a contained recycling area on the north side of the equipment building for tenants to dispose of used aircraft oil.

Table 1-7
Indoor Aircraft Storage Summary

	Number of Buildings	Number of Spaces	Discount Percent	Subtracted Spaces	Total Spaces
EAST					
Wings Aviation	3	10	-2%	0	10
Former Jet Choice	1	8	-10%	1	7
Storage – Riverside Hangar	1	10	-10%	0	10
Storage – Mercury Avenue	10	23	-2%	0	23
WEST

Signature	12	56	-10%	6	50
Storage – 1987 Area	4	9	-10%	1	8
Storage – 1999 Area	9	30	-10%	3	27
TOTALS	46	174		12	159
TOTAL without Military	45	164		12	149

Source: MAC visual survey and review of aerial maps

1.4.6 Roadway Access

The airport lies just south of Interstate 94 and east of Interstate 35E, and can be accessed using Trunk Highway 52 to Plato Boulevard. These main roads link the airport to the metropolitan area and the entire region. Robert Street, a main thoroughfare in downtown St. Paul, connects with Fillmore Street and Plato, both of which connect directly to Bayfield Street. Interior airport access roads include Bayfield Street, Airport Road, and Eaton Street.

1.4.7 Vehicle Parking Areas

A large parking lot exists in front of the main terminal building. It can accommodate more than 200 vehicles. Each FBO has parking for their customers. The number varies for each facility. The Minnesota Army National Guard also has a large parking lot across Airport Road from their building that contains more than 300 spaces. Note, however, that many of these spaces are located on railroad right-of-way, and not on MAC property, and most are just gravel, not paved.

All privately owned hangars are accessed via the taxilanes, with tenants parking inside or adjacent to their individual hangars.

1.5 Airport Environment

This section highlights briefly the airport environment, including available utilities, drainage, and local services provided.

1.5.1 Utilities and Local Services

Most tenants at the airport have either electric or natural gas service, or both, as well as telephone service. The electrical lines are above ground in some locations at the airport, and below ground in others. The tenants are billed directly by the utility companies. Qwest provides telephone service, and Xcel provides natural gas and electric service to the airport.

The City of St. Paul offers emergency services for the airport, including police, fire and rescue. This is achieved through agreements between MAC and the City.

1.5.2 Drainage and Water Quality

The following text regarding existing soils is taken from the Water Management Plan prepared for the airport for MAC by Wenck Associates, dated November 1996:

> The natural soils at the airport generally consist of alluvium deposited by the retreating ice of the Wisconsin glacation. The deposit is typically 100 feet deep. Most of the area where the airport lies was originally marsh land. Throughout the history of the airport, several grading operations utilizing river dredge material were completed. It is believed that the river dredge material consisting of predominantly sand has been used for fill material throughout the airport property along with various other fill materials, however, exact locations and volumes are unknown.
>
> The south half of Runway 14-32 was constructed by removing vegetation under the core of the runway and placing fill over the underlying soft soils. The core embankment for the runway consists of sand (select granular) material. The safety areas consist of common fill generally made up of sand, clay, silt, and broken limestone.
>
> Soils classification at the airport fall under the Chaska and Udorthents associations as shown on the General Soils Map contained in the Ramsey County Soil Survey. These soils are generally described as level to very gently sloping. The Chaska soils are present in the southern marshy portions of the site and are poorly drained soils subject to frequent flooding from the Mississippi River consisting of silt loam for approximately the top six inches. The Udorthents soils are present on the majority of the site and consist of variable permeability fill soils consisting of Mississippi River dredging materials and various fill materials as previously described.

In 2005, MAC completed a project to enhance the overall subdrain system at the airport and for specific pavement areas. The project was designed to speed drainage from the subgrade areas of the primary Runway 14-32 and certain taxiways. Inundation by flood waters would impact the weight-bearing capacity of these pavements for as long as water remained present within the subgrade. In addition to enhancing pavement drainage, the project redesigned the main ditch system and included the construction of infiltration basins within airport property for better surface water drainage. Finally, the project rerouted direct drainage to the river, and reduced the number of direct outlets to the Mississippi River from 23 to six. As a result, the discharge of runoff has also been reduced to a much lower rate because of the new storage/infiltration basins. Figure 1-21 shows the general drainage and direction of flows since construction of the subgrade project.

The airport lies within the jurisdiction of the Lower Mississippi River Watershed Management Organization. In 1996, MAC completed a Water Management Plan for the airport, in which the analysis found the existing storm water management system appears to function adequately to convey storm water runoff from the airport. No deficiencies in the system were reported.

There are only a few wetland areas at the airport. The first is a wetland area southwest of the south hangar area. This wetland represents the edge of pre-existing wetland left in place after the fill was completed for the Runway 14-32 and south hangar area construction. A small remnant of this wetland also exists near the south end of Runway 32 between Taxiways A and B. The third wetland area is located near the northeast side of the airport, between the barrel-roof 3M hangar and the river.

The entire airport is located within the floodplain of the Mississippi River. The recent floodwall construction project removed the majority of floodway from the airfield, but a portion of floodway remains at the south end of the airport. While the floodwall can protect the airport up to a 1% event, it does not guarantee the airport will not flood from higher events. Therefore, the airport is still considered to be located within the floodplain.

MAC maintains a Storm Water Pollution Prevention Plan (SWPPP) and a Spill Prevention Control and Countermeasure Plan (SPCC) for MAC-owned facilities at the Airport. MAC has a general storm water discharge permit from the Minnesota Pollution Control Agency (MPCA). In addition, MAC maintains a Water Management Plan for the airport. It includes best management practices for protecting the storm water conveyances, wetlands, and groundwater. Due to the activities performed by the fixed base operators (FBOs), they are required to maintain their own general storm water discharge permit from the MPCA, along with their own SWPPP and SPCC plans.

Chemicals used in deicing activities at airports is of concern because of the potential effects on receiving water bodies. Airport tenants and/or FBOs conduct little aircraft deicing at STP. Most aircraft can be stored inside heated hangars prior to takeoff or cannot fly when icing conditions exist, which eliminates the need for glycol use. MAC may use some minor amounts of urea on the runways during icing conditions. The amount used varies annually. Salt is not used due to its corrosive nature. Sand is used on a limited basis, depending on weather conditions. Given these minor uses, the potential impact on water quality from the airport is minimal.

1.5.3 Sanitary Sewer and Water

The entire St. Paul Downtown Airport is served with sanitary sewer and water. All tenants have the ability to connect to the system, and most have already. Commercial operators and FBOs were required to connect years ago. MAC and FAA facilities are also connected. MAC adopted its Sanitary Sewer and Water Policy in 1998, as well as a subsequent revision in October 2000. Consistent with that policy, no new wells or holding tanks have been allowed at the airport.

1.6 Meteorological Data

The St. Paul Downtown Airport is equipped with an Automated Surface Observing System (ASOS). The ASOS provides computerized weather readings 24-hours a day, with updates every minute, continuously reporting significant weather changes as they occur. The ASOS system reports cloud ceiling, visibility, temperature, dew point, wind direction and speed, altimeter setting (barometric pressure), and density altitude (airfield elevation corrected for non-standard temperature). The recording and monitoring equipment for the ASOS is located in the infield area between Runways 31 and 32 and north of taxiway E (see Figure 1-17). It requires a 1,000-foot radius in which no obstructions or significant amount of pavement exists since they may interfere with the weather readings.

1.7 Area Land Use, Airspace and Zoning

One of the biggest challenges facing airports today is the presence of incompatible land use either adjacent to the airport or in runway flight paths. Working closely with city officials, airport users, developers, and any nearby residents, airports can reduce land use conflicts through the use of zoning regulations that disallow certain types of nearby development.

The City of St. Paul has a well established practice of requiring proposed development around or near the airport to be reviewed by the FAA and MAC. It recommends these agencies review all applications for development to determine if the proposed structure would be a "general obstruction to air navigation" or an "obstruction to a public airport", and to ensure that proper notification to the Commissioner of Transportation is made if so required.

In general, land use around the airport varies. The river bounds the east side of the airfield, as well as a portion of the south. Industrial uses are adjacent to the west. Industrial uses also exist in the areas between the airport and the river on the north and south. There are residential land uses on the bluff areas both across the river to the east and across Highway 52 on the west.

Figures showing the existing land use maps and a discussion on airport zoning are included in Chapter 6 of this report.

1.8 Area Socioeconomic Data

The reliever airport system owned and operated by MAC includes the St. Paul Downtown Airport and five other airports in the metropolitan area. According to the *Economic Analysis of Reliever Airport System*, prepared by Wilder Research in October 2005 for MAC, it is estimated that STP contributes more than $112 million per year to the local economy and supports 853 jobs. This includes on-airport services, fuel sales, and visitor spending in the community.

1.9 Historic Airport Activity

Aircraft based at and using STP includes primarily business jets, but also single-engine, twin-engine piston and turbo props, helicopters and military aircraft (primarily helicopters). It is assumed that flights in and out of STP are of both a business and a recreational nature.

The based aircraft fleet mix currently registered with the State of Minnesota, as of 2007, consists of 23 single-engine planes (25%), 8 multi-engine piston aircraft/light twins (8.5%), 8 turboprops (8.5%), 15 helicopters including military (16%), and 39 jets (42%).

In recent years, the activity at the airport has been declining. This is due to the overall downward trend in aviation since the events of September 11, 2001, primarily in general aviation. It is assumed that the majority of single-engine operations are recreational or of a flight training nature. While single-engine aircraft operations are forecasted to continue declining, jet operations are anticipated to increase at the airport over time. Overall, an increase in aircraft operations is forecasted. See Chapter 2.

Chapter

2 Aviation Forecast

This chapter provides a summary of the aviation activity forecasts prepared for the Long-Term Comprehensive Plan (LTCP) for the St. Paul Downtown Airport-Holman Field (STP). The forecasts are intended for use in subsequent facility requirements analyses for the airside and landside area development. A credible and usable forecast is critical to ensure that the type and size of the planned facilities are appropriate for future conditions. Forecasts are presented for an approximate 20-year time horizon, and include 2010, 2015, 2020, and 2025. The forecasts are unconstrained and assume that the necessary facilities will be in place to accommodate demand except where noted.

The existing and projected socioeconomic conditions in the area and current general aviation activity are used to prepare the assumptions that form the foundation of the forecasts. Based aircraft forecasts for the Metropolitan Airports Commission (MAC) airports are calculated and then allocated among the individual airports. Operations and peak activity forecasts for St. Paul Downtown Airport are derived from the based aircraft forecasts. The analysis includes a set of high and low activity scenarios for the airport.

The assumptions inherent in the following calculations are based on data provided by the MAC, federal and local sources, and professional experience. Fuel cost assumptions reflect the recent major increase in oil prices. Forecasting, however, is not an exact science. Departures from forecast levels in the local and national economy and in the aviation industry could have an effect on the forecasts presented herein.

A copy of the full Activity Forecasts - Technical Report is contained in Appendix A of this document. The report includes background information, socioeconomic data, historical trends, and detailed descriptions of the assumptions for the forecasts. This chapter is a brief synopsis of that report as it pertains to the St. Paul Downtown Airport.

2.1 Aircraft Fleet Mix and Based Aircraft Forecasts

The number of civil based aircraft at STP is expected to increase from 83 in 2007 to 122 in 2025. Jets, including microjets, are expected to increase significantly while piston-powered aircraft are projected to decrease. The number of based aircraft at Holman Field is projected to increase due to the elevated concentration of high-performance aircraft typically used in business. Holman Field currently has 10 military based aircraft which are expected to remain constant during the forecast period.

Table 2-1 shows the results of the based aircraft forecasts for the STP.

2.2 Aircraft Operations Forecasts

The forecasts of aircraft operations were derived from the based aircraft forecasts. Estimates of base year operation levels were obtained from the FAA Air Traffic Activity Data System (ATADS) data base, supplemented by Airport Noise and Operations Monitoring System (ANOMS) data for operations that occur when the Air Traffic Control Tower is not open. Base year operations by aircraft type were based on ANOMS data collected by the MAC. The ANOMS data base misses many of the aircraft flying under Visual Flight Rules. Those were allocated among piston aircraft according to the distribution of based aircraft.

Table 2-1
Based Aircraft Forecast Summary

	2007	2010	2015	2020	2025	Ave Annual Growth Rate
Single Engine Piston	23	23	21	20	19	-1.0%
Multi Engine Piston	8	9	8	8	8	0%
Turboprop	8	9	9	9	9	0.6%
Microjets (VLJs)	0	3	8	13	16	
Other Jets	39	46	54	60	62	2.3%
Helicopter	15	15	17	18	18	0.9%
Other (a)	0	0	0	0	0	0%
TOTAL	93	105	117	128	132	1.8%

(a) Balloons, gliders, and ultralight aircraft.
Source: Appendix A – HNTB Activity Forecasts Technical Report, Table 8, April 2009.

The aircraft operations forecasts assume that average aircraft utilization will change consistent with the adjusted FAA forecasts. In each aircraft category, operations per active aircraft were projected to change at the same rate as hours flown per based aircraft, implicitly assuming that the number of operations per hours flown remain constant. The percentage of touch and go operations in each aircraft category was assumed to remain constant. Total military operations were also assumed to remain constant.

Table 2-2 summarizes the aircraft operations forecasts for STP. The FAA projects average aircraft utilization to increase as a result of increased flying by business and corporate users.

Operations at STP are projected to increase from 125,254 in 2007 to 137,310 in 2025, an average annual increase of 0.5 percent. Decreases are projected in single and multi-engine piston and turboprop categories, with significant increases projected for all the other categories. By 2025, combined jet operations are projected to account for about 31 percent of total operations at Holman Field, compared to about 13 percent currently.

Table 2-2
Aircraft Operations Forecast Summary

	2007	2010	2015	2020	2025
Single Engine Piston	55,485	41,984	37,344	38,263	39,374
Multi Engine Piston	21,938	20,412	15,723	16,014	17,019
Turboprop	7,864	7,510	7,376	7,251	7,227
Microjets (VLJs)	22	2,957	7,601	12,282	15,000
Other Jets	16,448	16,697	22,080	26,123	28,243
Helicopter	23,497	22,310	27,276	30,122	30,448
Other (a)	0	0	0	0	0
TOTAL	125,254	111,870	117,399	130,056	137,310

(a) Balloons, gliders, and ultralight aircraft.
Source: Appendix A – HNTB Activity Forecasts Technical Report, Table 11, April 2009.

The revised 2009 FAA forecasts, published about the end of April 2009, have taken note of recent changes in the very-light-jet (VLJ) industry. While the 2008 forecasts used for this analysis projected about 450 new VLJ aircraft per year (nationally), the 2009 forecasts are projecting 270-300 new VLJ aircraft per year. There was also a more drastic reduction in projected hours flown per aircraft from 1000 per year to 432 per year.

It is possible that the current FAA forecasts are too pessimistic, just like the earlier forecasts were too optimistic. There is great uncertainty in the industry right now, and there are growing pains associated with any new technology. Therefore, the forecasts will not be adjusted at this time. Also, VLJ growth rates are not shown because, with such small base year numbers, the annual percentage growth rate is very high, especially for operations.

2.3 Peak Activity Forecasts

Table 2-3 shows the peak month, average day peak month (ADPM), and peak hour operations forecasts for STP. The relationship between peak activity and annual activity was assumed to remain constant.

Table 2-3 presents the peak activity forecasts for STP and was estimated from FAA air traffic control tower records. Peak hour operations were assumed to be 15 percent of ADPM operations, consistent with the assumptions in the previous STP LTCP. The peak month for the airport is October, and ADPM operations were estimated by dividing by 31 days. Peak hour operations are projected to increase from 60 in 2007 to 65 in 2025.

Table 2-3
Peak Activity Forecast Summary

	2007	2010	2015	2020	2025
Annual Operations (a)	125,254	111,870	117,399	130,056	137,310
Peak Month Operations (b)	12,318	11,002	11,546	12,791	13,504
ADPM Operations (c)	397	355	372	413	436
Peak Hour Operations (d)	60	53	56	62	65

(a) From Table 2-1.
(b) The 2007 percentage of peak month operations based on ATCT counts is assumed to continue through the forecast period.
(c) Average Daily Peak Month - Peak month (October) operations divided by 31 days.
(d) Assumed to be 15 percent of ADPM operations.
Source: Appendix A – Activity Forecasts Technical Report, Table 14, April 2009.

2.4 Forecast Scenarios

General aviation activity has historically been difficult to forecast, since the relationships with economic growth and pricing factors are more tenuous than in other aviation sectors, such as commercial aviation. This uncertainty is likely to carry over into the near future, given the volatility of fuel prices and the anticipated emergence of microjets. To address these uncertainties, and to identify the potential upper and lower bounds of future activity at St. Paul Downtown Airport, detailed high and low fuel price scenarios are presented. These scenarios use the same forecast approach that was used in the base case, but alter the assumptions to reflect either a more aggressive or more conservative outlook towards fuel costs.

2.4.1 High Forecast Scenario

The high forecast activity scenarios for the airport assumes that after the oil price spike in 2008, fuel prices return to the levels that had been originally projected by the Office of Management and Budget (see Table I.1 in Appendix A). Other assumptions, including capacity constraints at MSP, are the same as in the base case.

Table 2-4 shows the high forecast scenario for STP. Total operations would be 14 percent higher than under the base case, and jet operations would account for almost 34 percent of total operations.

Table 2-4
High Forecast Scenario

(a) Balloons, gliders, and ultralight aircraft.
Source: Appendix A – Activity Forecasts Technical Report, Table 17, April 2009.

2.4.2 Low Forecast Scenario

The low forecast scenarios for the airport were prepared assuming that oil prices would continue to increase after 2008, rising to $200 per barrel by 2010, and then remaining at that level (see Table I.2 in Appendix A). Other assumptions, including capacity constraints at MSP, are the same as in the base case.

The low scenario forecast for St. Paul Downtown Airport is presented in Table 2-5. By 2025 total based aircraft are expected to be 9 percent lower than under the base case. Total operations would be 18 percent lower than in the base case by 2025.

2.5 Summary

The base case forecasts project a moderate growth in based aircraft at St. Paul Downtown Airport. Operations are projected to decline through the 2010-2015 period and then begin to rise again later in the forecast, reflecting anticipated stabilization of oil prices at a new higher level. Although activity by piston powered aircraft is projected to decline, activity by higher performance turboprops and jets favored by business aviation is projected to increase significantly.

The forecast scenarios indicate that future fuel prices will have a major impact on the development of general aviation. Therefore, it is prudent to closely monitor actual aviation activity and modify the phasing of facility improvements if that activity materially departs from forecast levels.

Chapter 3

Airside and Landside Facility Requirements

This chapter describes the facility requirements needed to accommodate the base case and demand forecasts for year 2025. The sections of this chapter are intended to:

- Describe relevant design criteria
- Present airfield requirements in context of the critical aircraft
- Review NAVAID requirements
- Identify general aviation facility requirements
- Review parking and airport access needs
- Review obstructions issues
- Present miscellaneous requirements for the airport

3.1 Airside Requirements

3.1.1 Airport Reference Code

Federal Aviation Administration (FAA) Advisory Circular 150/5300-13 Airport Design outlines airport design guidelines. Primarily aimed at maintaining airport safety and efficiency, these guidelines help ensure that facilities at a given airport will match the requirements of the type of aircraft actually using (or forecast to use) the airport on a regular basis. For example, an airport serving larger aircraft will need wider runways and bigger safety areas than will an airport serving small single-engine aircraft. In addition to aircraft type, airport design is also affected by the existing or planned approach visibility minimums for each runway.

To match aircraft type to the appropriate facility requirements, an Airport Reference Code (ARC) is applied to each runway. An ARC is most often determined based upon the Approach Category (grouping by approach speed) and the Airplane Design Group (ADG - grouping by wingspan and tail height) of aircraft using or expected to use the airport on a regular basis (at least 500 operations a year); though the FAA also considers local characteristics when approving applied criteria.

3.1.2 Approach Category

The current aircraft approach category assigned to Runway 14-32 at the Airport is “D”. Typical aircraft in this aircraft approach category include business jets such as the Gulfstream V. Both Runways 13-31 and 9-27 are assigned aircraft approach category “B”. Runway 13-31 is designed for aircraft over 12,500 pounds maximum gross take-off weight. Typical aircraft in this approach category and weight include small business jets such as the Cessna Citation III. Runway 9-27 is designed for aircraft less than 12,500 pounds. Typical aircraft in this category are single-engine and twin-engine piston and few turboprops such as the Raytheon Beechcraft King Air B200 and smaller. See Figures 3-1 and 3-2.

Given that the role of the airport and types of aircraft operating there is not anticipated to change over the forecast period, the plan recommends the criteria associated with these categories of aircraft continue to be applied. See Table 3-1.

Table 3-1
Aircraft Approach Category

	Knots
A	Speed less than 91 knots.
B	Speed 91 knots or more but less than 121 knots.
C	Speed 121 knots or more but less than 141 knots.
D	Speed 141 knots or more but less than 166 knots.
E	Speed 166 knots or more.

3.1.3 Airplane Design Group

The current airplane design group applied to Runway 14-32 is Group III. This means that the runway is designed to accommodate aircraft with wingspans less than 118 feet. Aircraft that fall into this category include most single-engine and twin-piston aircraft, turbo props and business jets. Runways 13-31 and 9-27 can accommodate airplane design Group II aircraft. Group II includes the Raytheon Beechcraft King Air B200 and smaller regional and corporate jets such as the Cessna Citation I, II and III and Gulfstream I. Table 3-2 shows the thresholds for the airplane design groups.

Table 3-2
Aircraft Design Group

Category	Wingspan Criteria	Tail Height Criteria
I	Up to but not including 49 feet	Up to but not including 20 feet
II	49 feet up to but not including 79 feet	20 feet up to but not including 30 feet
III	79 feet up to but not including 118 feet	30 feet up to but not including 45 feet
IV	118 feet up to but not including 171 feet	45 feet up to but not including 60 feet
V	171 feet up to but not including 214 feet	60 feet up to but not including 66 feet
VI	241 feet up to but not including 262 feet	66 feet up to but not including 80 feet

3.1.4 Wind Coverage

Weather conditions have a significant influence on the operational capabilities at an airport. Wind speed and direction help determine runway orientation. Temperature plays a role in determining runway length. High temperatures in the summer months result in longer runway length requirements. Cloud cover and low visibility are factors used to determine the need for navigation aids and instrument approaches.

Aircraft generally take off and land directly into the wind, or at least as directly into the wind as a given runway alignment allows. Crosswind runways are used when the wind is blowing perpendicular to the primary runway. Because small single-engine aircraft have less power and are lighter than larger aircraft, they often have the most pressing need for crosswind runways.

The FAA prefers that the primary runway supply at least 95% percent wind coverage for the aircraft anticipated to use the airport. If the primary runway does not provide this level of coverage, a crosswind runway may be justified.

Wind and weather data from the National Oceanic and Atmospheric Administration for the St. Paul Downtown Airport Automated Surface Observing Systems (ASOS) for 1996– 2005 was obtained. This data was used to analyze the amount of wind coverage provided by the current runways.

Because larger, heavier and more powerful aircraft need a crosswind runway less often than smaller, lighter and less powerful ones, different wind speeds are used in the crosswind runway analysis for different aircraft. These different wind speeds are called crosswind components. Crosswind components are defined by wind direction and speed taken at a right angle to a runway. The FAA recommends that the criteria depicted in Table 3-3 be applied:

Table 3-3
Crosswind Components

Crosswind Component	Airport Reference Code
10.5 knots	A-I, B-I
13 knots	A-II, B-II
16 knots	A-III, B-III, C-I through D-III
20 knots	A-IV through D-VI

Tables 3-4 and 3-5 summarize the wind coverage of runways for different crosswind components. Table 3-4 includes the data for all of the weather conditions and Table 3-5 includes only the data when the weather is under Instrument Flight Rules (IFR) conditions of less than 1,000 foot ceilings and/or three miles visibility but greater than 200 feet ceilings and half mile visibility (closed conditions).

Table 3-4
All Weather Wind Coverage

Wind Speed	Airport Reference Code	Rwy 14-32	Rwy 13-31	Rwy 9-27	All Runways
10.5	A-I and B-I	95.02%	95.28%	89.59%	98.73%
13	A-II and B-II	97.68%	97.90%	94.83%	99.67%
16	A-III, B-III, and C-I through D-III	99.48%	99.60%	98.85%	99.94%

Source: NOAA National Data Center, US Department of Commerce, St. Paul Downtown Station (WMO: 726584), 01/01/96 to 12/31/05.

Runways 14 and 32 have precision and non-precision instrument approaches, and Runway 31 has a non-precision instrument approach. These allow aircraft to land in a wider range of weather conditions. The data from the St. Paul ASOS indicates that weather conditions are below 1,000 feet ceilings and/or three mile visibility about seven percent of the time. Weather data indicates that during IFR conditions, Runway 14 is favored.

Table 3-5
IFR Weather Wind Coverage

Wind Speed	Airport Reference Code	Rwy 14-32	Rwy 13-31	Rwy 9-27	All Runways
10.5	A-I and B-I	97.12%	97.24%	92.72%	99.33%
13	A-II and B-II	98.47%	98.69%	96.69%	99.81%
16	A-III, B-III, and C-I through D-III	99.71%	99.75%	99.21%	99.95%

Source: NOAA National Data Center, US Department of Commerce, St. Paul Downtown Station (WMO: 726584), 01/01/96 to 12/31/05.

These tables show that the runways at the airport provide good wind coverage.

Another important factor to consider when planning facilities at airports is temperature. Temperature effects aircraft performance. The standard used is the mean daily maximum temperature of the hottest month at the airport. For the St. Paul Downtown Airport, the mean maximum temperature of the hottest month (July) is 83.2 degrees Fahrenheit.

3.2 Airside Capacity Requirements

3.2.1 Annual Service Volume

Airfield capacity is defined as the maximum number of operations that can be accommodated by a particular airfield configuration during a specified interval of time when there is constant demand. Annual service volume (ASV) is one capacity measure and the average hourly capacity is another.

The Annual Service Volume (ASV) for a given airport is the annual level of aircraft operations that can be accommodated with minimal delay. For an airport with annual operations below its ASV, delay is minimal, within one to four minutes per operation. Anything above four minutes of delay per operation can result in increased congestion that can adversely tax airfield capacity.

An airfield system's capacity is determined by a multitude of factors, including prevailing winds and associated orientation of runways, number of runways, taxiway system, fleet mix, operational characteristics of based aircraft and weather conditions.

St. Paul Downtown Airport's ASV is currently calculated to be 265,000, which is well above its current and 2025 projected annual operations of 125,254 and 137,310 respectively. It is also well above the high scenario 2025 year forecast of 156,431 annual operations. From the FAA Advisory Circular 150/5060-5 (Airport Capacity and Delay), St. Paul Downtown Airport's average hourly capacity was estimated to be 132 operations during VFR conditions and 59 operations during IFR conditions. Peak activity forecasts show 65 peak hour operations for the year 2025. Table 3-6 summarizes these numbers in terms of airside capacity.

Table 3-6
Airside Capacity

	Base/Forecasted Operations	Ops/Year Maximum	% Airside Capacity	Base/Forecasted Peak Hour Ops (VFR)	Ops/Hour Maximum (VFR)	% Airside Capacity
2007	125,254	265,000	47.3	60	132	45.5
2010	111,870	265,000	42.2	53	132	40.2
2015	117,399	265,000	44.3	56	132	42.4
2020	130,056	265,000	49.0	62	132	47.0
2025	137,310	265,000	51.8	65	132	49.2

St. Paul Downtown Airport has adequate runway capacity to support all of the forecast scenarios. This means that runway capacity will not be a contributing factor to any airport improvements.

3.2.2 Runway Length

Runway length requirements are based on the type of aircraft using or expected to use the runway, and are affected by temperature, airport elevation, and runway gradient. In addition, runway surface conditions also impact runway requirements. This last factor is an important consideration for determining runway lengths at airports in northern climates where wet and icy conditions exist.

Runway length analysis was conducted using two similar methods. The first method was the FAA Advisory Circular 150/5325-4B Runway Length Requirements for Airport Design while the second was the FAA Airport Design for microcomputers program.

FAA Advisory Circular (AC) 150/5325-4B, Runway Length Requirements for Airport Design uses a five-step procedure to determine recommended lengths for a list of critical design aircraft or "family grouping of aircraft having similar performance characteristics and operating weights." Although this methodology is general in nature, it recognizes that there is uncertainty about the composition of the airport fleet mix during the forecast period. Determining runway length based on a family of aircraft ensures the greatest measure of flexibility.

The AC provides runway length requirement tables for three groups of aircraft based upon the Maximum Certificated Takeoff Weight (MTOW):

- Airplane Weight Category 12,500 pounds or less;
- Airplane Weight Category over 12,500 pounds but less than 60,000 pounds; and
- Airplane Weight Category 60,000 pounds or more or Regional Jets.

Based on both the existing and future fleet mix at STP the airplanes that will require the longest runway lengths are Airplane Weight Category 60,000 pounds or more or Regional Jets. For these sized aircraft the advisory circular recommends using performance charts from individual aircraft manufactures. The critical aircraft at the airport is the Gulfstream V (G-V), which has a maximum gross take-off weight (MTOW) of 91,000 pounds.

During the recent Engineering Materials Arrestor System (EMAS) project at STP, a runway length analysis was done. Gulfstream was contacted and responded that the G-V requires 7,300 feet balanced field length to take-off at MTOW on an 85 degree day[1].

The runway length for a crosswind runway equals 100% of the recommended runway length determined for the lower crosswind capable airplanes using the primary runway. At STP the Airplane Weight Category 12,500 pounds or less should be considered for the crosswind runway length since these aircraft are impacted by crosswinds. Under this weight range, one of two "percentage of fleet" categories can be used (95 percent or 100 percent).

Figure 2-1 of the advisory circular was used to calculate runway length requirements for this category of aircraft. The calculations consider airport elevation above mean sea level, and mean daily maximum temperature of the hottest month.

To accommodate 95 percent of the fleet, the crosswind runway length should be approximately 3,300 feet. To accommodate 100 percent, the crosswind runway length should be approximately 3,900 feet long.

Another way to calculate runway length requirements is to use the Airport Design for microcomputers program that is part of FAA AC 150/5200-13-Airport Design. This program incorporates Airport elevation, mean daily maximum temperature, length of haul, and runway conditions. The following analysis was done as a cross check. The Airport Design for microcomputers program provides runway length requirement tables for six groups of aircraft:

- Small airplanes with approach speeds of less than 30 knots
- Small airplanes with approach speeds of less than 50 knots
- Small airplanes with less than 10 passenger seats
- Small airplanes with 10 or more passenger seats
- Large airplanes of 60,000 pounds or less
- Airplanes of more than 60,000 pounds

[1] Supporting Information for RSA Determination-St. Paul Downtown Airport, July, 2006.

Based on the above criteria, the category of airplanes of more than 60,000 pounds applies and requires a 6,620-foot runway. For small airplanes with less than 10 passenger seats, the runway length should be approximately 3,200 feet to accommodate 95 percent of these aircraft and 3,810 feet to accommodate 100 percent of these aircraft.

Table 3-7
Recommended Runway Lengths

AIRPORT AND RUNWAY DATA	
Airport elevation	705 feet
Mean daily maximum temperature of the hottest month	83.2 F
Maximum difference in runway centerline elevation	4 feet
Length of haul for airplanes of more than 60,000 pounds	1,200 miles

RUNWAY LENGTHS RECOMMENDED FOR AIRPORT DESIGN (for wet and slippery runways)	
Small airplanes with approach speeds of less than 30 knots	320 feet
Small airplanes with approach speeds of less than 50 knots	860 feet
Small airplanes with less than 10 passenger seats	
75 percent of these small airplanes	2,670 feet
95 percent of these small airplanes	3,200 feet
100 percent of these small airplanes	3,810 feet
Small airplanes with 10 or more passenger seats	4,280 feet
Large airplanes of 60,000 pounds or less	
75 percent of these large airplanes at 60 percent useful load	5,410 feet
75 percent of these large airplanes at 90 percent useful load	7,000 feet
100 percent of these large airplanes at 60 percent useful load	5,500 feet
100 percent of these large airplanes at 90 percent useful load	8,050 feet
Airplanes of more than 60,000 pounds	Approximately 6,620 feet

Source: FAA's Airport Design software (Version 4.2D)

It should be noted that as part of the floodwall construction permitting process with the City of St. Paul, MAC adopted a resolution which contains the following assurance: "MAC will not take any action to increase the length of the runways at the Airport in excess of the current length, unless required to do so by State law, provided that MAC will not initiate, promote, or otherwise support enactment of such law."

3.2.3 Runway Orientation

For optimum runway design, the primary runway should be orientated to capture 95 percent of the crosswind component perpendicular to the runway centerline for any aircraft that is to use the airport. At STP, the primary runway is slightly above 95%. In cases where this criteria cannot be met, a crosswind runway is recommended. A crosswind runway is also recommended when certain aircraft with lower crosswind capabilities are unable to utilize the primary runway, provided they have over 500 annual operations at that airport. According to criteria found in FAA Advisory Circular 150/5325-4B, Runway Length Requirements for Airport Design, dated July 1, 2005, crosswind runway length should be 100% of the recommended runway length for the aircraft with lower crosswind capabilities. If the crosswind runway is designed to accommodate the same aircraft as the primary runway, it should be the same length as the primary. If it is designed for different (typically smaller) aircraft, it should be designed to accommodate the needs of those aircraft. At STP, the crosswind runway should be designed to accommodate smaller aircraft than the primary runway and therefore the recommended length of the crosswind runway is 3,810 feet.

3.2.4 Runway Width and Shoulders

The FAA establishes 100 feet as the required width for a runway supporting D-III ARC and 75 feet for B-II with visibility minimums not lower than ¾ miles. Runways 14-32 and 13-31 at STP are 150 feet wide and Runway 9-27 is 100 feet wide.

Runway shoulders are intended to provide a transition surface between the runway pavement and the adjacent surface, to support aircraft running off the pavement, provide blast protection, and enhance erosion control and drainage. For D-III ARC, the required shoulder width is 20 feet and for B-II, the required shoulder width is 10 feet. The airport meets these requirements.

3.2.5 Runway Safety and Object Free Areas

There have been recent improvements to the Runway Safety Areas (RSAs) at St. Paul Downtown Airport. Runway 14-32 RSA width is 500 feet and the length beyond the end of the runways is 500 feet for Runway 14 and 218 feet for Runway 32. The requirement for a D-III runway is 500 feet wide and 1,000 feet beyond the runway end. An Engineered Material Arresting System (EMAS) bed was installed at each Runway 14-32 end in 2008 because of this deficiency. The material is designed to slow an aircraft skidding off the end of the runway and gently stop it without damage to the aircraft landing gear or passengers. It is an FAA-approved system that meets criteria in lieu of a full-length safety area.

The Runway 13-31 and Runway 9-27 RSA width is 150 feet and the length beyond the end of the runways is 300 feet. These runways meet the safety area requirements for ARC-II with greater than ¾ mile visibility minimums.

The Runway Object Free Area (ROFA) is centered on the runway and should be clear of any above ground objects protruding into the runway safety area edge elevation. An exception to this rule is related to objects necessary for air navigation or aircraft ground movement. The ROFA width is 800 feet for Runway 14-32 and 500 feet for Runways 13-31 and 9-27. The length beyond the end of the runway is the same as the RSA. All runways meet this criterion except for Runway 14. The far corners of the OFA are deficient. A request for modification to design standards for the Runway 14 OFA is pending until the FAA review of the as-built Airport Layout Plan is complete.

The Runway Obstacle Free Zone (OFZ) is a defined airspace centered above the runway and extends 200 feet beyond each runway end. The width varies depending on the characteristics of the runway's critical aircraft. For STP, it is 400 feet wide for Runway 14-32 and 250 feet wide for Runway 13-31 and 9-27. All runways meet FAA requirements.

3.2.6 Taxiway Requirements

ADG III criteria for taxiway width are 50 feet. The parallel taxiways and all connector taxiways are currently 50 feet wide.

For ADG III aircraft and any approach visibility minimums, the recommended runway centerline-to-taxiway centerline separation is 400 feet for approach category C and D aircraft. For ADG II aircraft and approach visibility minimums not lower than ¾ mile, the recommended runway centerline-to-taxiway centerline separation is 240 feet for approach category A and B aircraft. For Runway 14-32, the parallel taxiway separation distance is currently 400 feet. For Runway 13-31, the parallel taxiway separation distance is currently 450 feet. The separation between runway and taxiway for both runways with parallel taxiways meets the FAA criteria for the existing visibility minimums. Runway 9-27 has only a small portion of parallel taxiway near the end of Runway 9, on each side of the runway. The separation between runway and taxiway on the north side is 245 feet and on the south side is 369 feet. All separations meet FAA criteria.

Taxiway turnoffs should be present to facilitate aircraft exit off of the supported runway, to reduce incursions and minimize time on runway. The existing connectors currently provide this functionality and AC 150/5300-13 guidance will be utilized for any future taxiways.

Paved or stabilized shoulders are recommended along taxiways. ADG III aircraft require 20 foot shoulders and ADG II require 10 foot shoulders. STP has 20-foot wide turf shoulders on all taxiways.

The Taxiway Object Free Area (OFA) width for ADG III aircraft is 186 feet and ADG II aircraft is 131 feet. The FAA-recommended taxilane OFA width is 162 feet for D-III and 115 feet for B-II airports. The FAA offers a calculation as an alternative that utilizes the wingspan of a particular aircraft to determine an adequate OFA. The formula takes the wingspan times 1.2, plus 20 feet.

Due to the presence of the sheet pile wall along Taxiway B and southern portion of Taxiway A, a modification to design standards was requested and approved. The Taxiway B connector OFA southwest of connector Taxiway A2 is restricted to aircraft with wingspans no greater than 71 feet. The Taxiway A OFA southeast of Taxiway B connector is restricted to aircraft with wingspans no greater than 100 feet. Pilots are made aware of those restrictions through the Airport/Facility Directory published by the U.S. Department of Transportation, Federal Aviation Administration.

3.3 Landside Requirements

3.3.1 Hangar Facilities

The St. Paul Downtown Airport, like all of the MAC airports, has a variety of hangar sizes. Unlike other MAC Reliever Airports, the hangar areas at STP are constrained with little opportunity to expand. The majority of hangars are sized to house large corporate aircraft, but there are also smaller hangars on the field. As shown in Chapter 1, the airport is estimated to have 149 indoor aircraft storage spaces, or 159 counting military aircraft. This number includes an assumption that some airport tenants sublease extra space for additional aircraft within their hangars, and includes a small discount for those who opt not to lease extra space.

Tenants own their hangars and lease the ground space from MAC. It is currently the policy of the MAC that no tenant can lease more space than they can justify with actual aircraft ownership. This practice has reduced the number of large hangar demands and, subsequently, reduces some of the subleasing opportunities at the airport.

According to the Chapter 2 forecasts, the number of based aircraft is anticipated to gradually rise from 93 in 2007 to 132 in the year 2025. The south hangar area expansion was completed in 2000, and still has large corporate hangar sites available. MAC also completed the “Mercury Avenue” hangar area in 2002 on the east side of the airport. It has four small aircraft hangar sites and a site for an 8-aircraft T-hangar still available. With a forecasted growth to132 aircraft by 2025, the airport has enough hangar space to meet the forecasted demand.

It should be noted that if the demand for hangar space begins to exceed the current capacity, it is possible to consider redevelopment in some areas; but for the most part, there is no additional space at the airport for any new hangar areas. It should also be noted that hangar construction in the Mercury Avenue area or anywhere along Bayfield Street on the east side of the airport is subject to specific floodway/floodplain development and construction requirements.

3.3.2 Fixed Base Operators

At the time of writing this document, the airport has two operating full service FBOs and a third vacant FBO space. The airport also has a commercial operator that provides flight training and small aircraft rental. There is no need or space for any additional FBO facilities.

3.3.3 MAC Administration Building

Aside from on-going maintenance related items, the administration building needs no major improvements. Some HVAC work is needed to improve the heating and cooling in the restaurant space. In addition, a project is programmed in the MAC Capital Improvement Program to install a drain system around the exterior of the basement. This will improve the drainage around the building and alleviate pressures on the basement walls during flood conditions.

3.3.4 Airport Access, Roadway Circulation and Parking

At this time, there are no issues related to airport access or parking. The MAC-owned administration building, the FBOs and hangar areas are all connected to the street system surrounding the airport.

3.3.5 Maintenance and Fuel Storage Areas

At this time, there is no demand or requirement for additional maintenance equipment or fueling capabilities at the airport. The main maintenance building located across the parking lot from the administration building is in need of repair. It has some exterior wall cracking that will continue to be monitored, and if necessary, a project will be pursued to correct it.

3.4 Lighting and Navigation Requirements

3.4.1 Runway and Taxiway Edge Lighting

The runway safety area projects recently completed for all three runways included any necessary runway and taxiway lighting modifications. There are currently no deficiencies on the field. The existing electrical vault building, however, does not meet code and must be brought into compliance.

3.4.2 PAPI

All of the Precision Approach Path Indicator (PAPI) systems on the airfield are new or recently new with the runway safety area improvement projects. A PAPI system is a row of lights normally located on the left side of a runway that provide visual descent guidance information during an approach to a runway. The lights are visible from about five miles during the day and up to 20 miles at night. There is no need for additional or upgraded PAPI systems.

3.4.4 Instrument Approach

As noted in the Chapter 1 inventory, Runway 14 has an Instrument Landing System (ILS) with an approach lighting system (MASLR) and one mile approach visibility. Additionally, Runway 32 has an ILS approach, and both Runway 14 and 32 have RNAV GPS approaches.

The previous long-term comprehensive plan recommended lead-in lights be installed for Runway 32. This was once again reviewed as a part of this update. A medium-intensity approach lighting system (MALSF) was also reviewed because of the benefits it would provide for approach minimums. In both cases, however, the physical location of the river would require Runway 14-32 to be shortened in order to allow the installation of an approach lighting system. The minor incremental benefit of the lighting system would not exceed the benefit of maintaining the existing runway length, and therefore, was dropped from further consideration.

Since the FAA recommends a minimum of 5,000 feet of runway for an ILS, the 4,004-foot Runway 13-31 is too short for such an installation. MAC has previously studied an extension to Runway 13, but it would overlap with the approach to Runway 14, and the resulting configuration would be undesirable from a safety standpoint. Runway 9-27 is shorter than Runway 13-31.

3.5 Security Requirements

The airport is fully surrounded by a perimeter fence. It provides dual functions in providing security as well as help to keep the local deer population outside of the fence and off the airfield. Automatic gates are installed at almost all airport entrances to the airfield. Those that are not power-operated gates are locked to ensure no unauthorized access to the field.

3.6 Utility Requirements

As noted in Chapter 1, all of the hangar areas and buildings are connected to or have the ability to connect to sanitary sewer and water. Other utilities also exist in all locations at the airport. At this time, there is no demand or requirement for additional utilities at the airport.

3.7 Obstruction Related Issues

Obstructions, if any, are typically analyzed when an Airport Layout Plan is prepared. Obstructions will be identified with a proposed disposition for each. In recent years, trees on airport property that were identified as potential obstructions were removed. In 2009, numerous additional trees were removed from airport and non-airport property to clear the runway approaches from such obstructions.

Chapter

4 Plan Recommendations

In this chapter, the different potential development options for the airport are analyzed. While the number of concepts could be infinite, the ones in this chapter have been developed taking into consideration the airport inventories, forecasted growth and facility requirements. In addition, other concepts or ideas arising from public input during the long-term comprehensive plan (LTCP) process also received consideration.

4.1 Airport Expansion - Runways and Hangar Areas

The St. Paul Downtown Airport currently has three runways, as discussed in Chapter 1. Typical alternatives can include additional runways, runway extensions, additional taxiways, and/or hangar areas, depending on existing needs, forecasts, and airfield capacity.

4.1.1 Runways

As shown in Chapter 2, Table 2-2, the number of operations in 2007 was 125,254. In Chapter 3, the maximum number of operations the airport can handle, the annual service volume, was identified as 265,000 operations based on the existing three runway configuration. Therefore, from an airside standpoint, the airport is currently at 47% capacity.

The baseline 2025 forecast number of operations at STP is 137,310 operations, equating to a capacity of about 52%. Under the high scenario, the 156,431 forecasted number of operations in 2025 would result in 59% capacity. None of these figures trigger the need to study additional runway capacity at STP at this time. The airport site is constrained, however, so it is unlikely an additional runway could be constructed. However, an alternative to consider would be re-alignment of one or more runways to increase the capacity when operation volumes trigger such an analysis.

Chapter 3, section 3.2.2 indicates the recommended runway length for the critical aircraft is 7,300 feet, and for the group of aircraft weighing more than 60,000 pounds, it is 6,620 feet. For smaller aircraft using STP, a runway length of 3,810 feet is recommended. As noted in Chapter 1, the primary runway is 6,491-feet, which is only 129 feet short of the recommended 6,620 feet. Runway 13-31 already exceeds the recommendation by 104 feet for small aircraft less than 12,500 pounds. Runway 9-27 is short of the recommended 3,810 feet by 168 feet. The runway safety improvements recently completed required the reduction of runway length for each of the three runways in order to obtain the required runway safety area length. It is not possible to extend the runways given the physical location of the river and the required safety area criteria. Therefore, STP cannot meet the FAA-recommended runway lengths to accommodate 100 percent of the aircraft that fall into the approach categories.

4.1.2 Hangar Areas

The number of based aircraft registered for STP in 2007 was 93 aircraft (including military aircraft), as identified in Table 2-1 in Chapter 2. Chapter 3 indicated that there is an estimated 149 actual indoor hangar spaces at the airport. This means the current landside capacity equates to about 62%.

According to the baseline forecast, the based aircraft would reach 132 including military aircraft, or approximately 89% capacity. As indicated in Chapter 3, the airport has enough capacity to meet the forecasted demand.

4.2 Plan Recommendations

As discussed above and in Chapter 3, there is no demonstrated need for specific airfield improvements at this time. There are, however, various airside and landside improvements that are recommended for implementation. They are itemized below, and shown in Figure 4-1.

4.2.1 Pavement Maintenance Program

It is recommended that MAC continue pavement reconstruction and rehabilitation as part of the on-going pavement maintenance program. For STP, MAC typically carries separate items in the capital improvement program for pavement maintenance. One line item includes pavement rehabilitation or reconstruction proposed for the seven-year program, for which costs are based on specific project locations. The second line item is an on-going every-other-year joint and crack repair item. Given the poor soils and saturation at STP, the pavements tend to move more which results in a more frequent need for repairs.

4.2.2 Terminal Sub Drain

As discussed in Chapter 3, this project is recommended to improve the drainage around the exterior basement of the administration building. The improved drainage will alleviate subsurface soil and water pressures put on the basement walls during flood conditions.

4.2.3 Electrical Vault Improvements

Also identified in Chapter 3, upgrades to the electrical vault building are recommended to bring the facility into code compliance. The recommended project includes a new building, HVAC, control panels, regulators, switchgears, etc.

4.2.4 Floodwall Maintenance

It is recommended that MAC continue to discuss and plan for the on-going maintenance, training, personnel/resources, compensatory excavation monitoring, and review any possible permit requirements for the floodwall.

4.2.5 Concurrent Use / Development Parcels

It is recommended that MAC continue to research the potential development of concurrent land uses for revenue generating purposes on airport property. There is only one parcel that has been identified to date for this type of development. It is located on the cul-de-sac of Ridder Circle on the north end of the airport, adjacent to the Pioneer Press facility. It is shown as Parcel 1R on Figure 1-4, and is highlighted in Figure 4-1.

4.2.6 Agency Coordination

It is recommended that MAC continue cooperation with the cities surrounding the airport through the existing Downtown Airport Advisory Commission, Joint Airport Zoning Board, and on-going MAC/City staff interaction.

Chapter

5 Environmental Considerations

An integral part of the airport planning process focuses on the manner in which the airport and any planned enhancements to the facility pose environmental impacts. This chapter evaluates the environmental implications of the planned operation and development of the St. Paul Downtown Airport.

5.1 Aircraft Noise

5.1.1 Quantifying Aircraft Noise

5.1.1.1 Basics of Sound

Sound is a physical disturbance in a medium, a pressure wave typically moving through air. A sound source vibrates or otherwise disturbs the air immediately surrounding the source, causing variations in pressure above and below the static (at-rest) value of atmospheric pressure. These disturbances force air to compress and expand, setting up a wavelike movement of air particles that move away from the source. Sound waves, or fluctuations in pressure, vibrate the eardrum creating audible sound.

The decibel, or dB, is a measure of sound pressure level that is compressed into a convenient range, that being the span of human sensitivity to pressure. Using a logarithmic relationship and the ratio of sensed pressure compared against a fixed reference pressure value, the dB scale accounts for the range of hearing with values from 0 to around 200. Most human sound experience falls into the 30 dB to 120 dB range.

Decibels are logarithmic and thus cannot be added directly. Two identical noise sources each producing 70 dB do not add to a total of 140 dB. The correct answer is 73 dB. Each time the number of sources is doubled, the sound pressure level is increased 3 dB.

Baseline:	70 dB
2 sources:	70 dB + 70 dB = 73 dB
4 sources:	70 dB + 70 dB + 70 dB + 70 dB = 76 dB
8 sources:	70 dB + 70 dB + 70 dB + 70 dB + 70 dB + 70 dB + 70 dB + 70 dB = 79 dB

The just-noticeable change in loudness for normal hearing adults is about 3 dB. That is, changes in sound level of 3 dB or less are difficult to notice. A doubling of loudness for the average listener of A-weighted sound is about 10 dB.[2] Measured, A-weighted sound levels changing by 10 dBA effect a subjective perception of being “twice as loud”.[3]

Figure 5-1 provides the noise levels for various common sources.

[2] A-weighted decibels represent noise levels that are adjusted relative to the frequencies that are most audible to the human ear.
[3] Peppin and Rodman, Community Noise, p. 47-48; additionally, Harris, Handbook, Beranek and Vér, Noise and Vibration Control Engineering, among others.

5.1.1.2 Day-Night Average Sound Level (DNL)

In 1979 the United States Congress passed the Aviation Safety and Noise Abatement Act. The Act required the Federal Aviation Administration (FAA) to develop a single methodology for measuring and determining airport noise impacts. In January 1985 the FAA formally implemented the Day-Night Average Sound Level (DNL) as the noise metric descriptor of choice for determining long-term community noise exposure in the airport noise compatibility planning provisions of 14 C.F.R. Part 150. Additionally, FAA Order 1050.1, *"Environmental Impacts: Policies and Procedures"* and FAA Order 5050.4, *"National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions,"* outline DNL as the noise metric for measuring and analyzing aircraft noise impacts.

As detailed above, the FAA requires the DNL noise metric to determine and analyze noise exposure and aid in the determination of aircraft noise and land use compatibility issues around United States airports. Because the DNL metric correlates well with the degree of community annoyance from aircraft noise, DNL has been formally adopted by most federal agencies dealing with noise exposure. In addition to the FAA, these agencies include the Environmental Protection Agency (EPA), Department of Defense, Department of Housing and Urban Development, and the Veterans Administration.

The DNL metric is calculated by cumulatively averaging sound levels over a twenty four-hour period. This average cumulative sound exposure includes the application of a 10-decibel penalty to sound exposures occurring during the nighttime hours (10:00 PM to 7:00 AM). Since the ambient, or background, noise levels usually decrease at night the night sound exposures are increased by 10 decibels because nighttime noise is more intrusive.

Figure 5-2 provides examples of typical DNL levels in various environments.

The FAA considers the 65 DNL contour line as the threshold of significance for noise impact. As such, sensitive land use areas (e.g., residential) around airports that are located in the 65 or greater DNL contours are considered by the FAA as incompatible structures.

5.1.1.3 Integrated Noise Model (INM)

The Federal Aviation Administration's (FAA) Office of Environment and Energy (AEE-100) has developed the Integrated Noise Model (INM) for evaluating aircraft noise impacts in the vicinity of airports. INM has many analytical uses, such as assessing changes in noise impact resulting from new or extended runways or runway configurations and evaluating other operational procedures. The INM has been the FAA's standard tool since 1978 for determining the predicted noise impact in the vicinity of airports. Statutory requirements for INM use are defined in FAA Order 1050.1, *"Environmental Impacts: Polices and Procedures"* and FAA Order 5050.4, *"National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions,"* and Federal Aviation Regulations (FAR) Part 150, *"Airport Noise Compatibility Planning."*

The model utilizes flight track information, runway use information, operation time of day data, aircraft fleet mix, standard and user defined aircraft profiles, and terrain as inputs. The INM model produces DNL noise exposure contours that are used for land use compatibility maps. The INM program includes built in tools for comparing contours and utilities that facilitate easy export to commercial Geographic Information Systems. The model also calculates predicted noise at specific sites such as hospitals, schools or other sensitive locations. For these grid points, the model reports detailed information for the analyst to determine which events contribute most significantly to the noise at that location. The model supports 16 predefined noise metrics that include cumulative sound exposure, maximum sound level and time-above metrics from both the A-Weighted, C-Weighted and the Effective Perceived Noise Level families.

The INM aircraft profile and noise calculation algorithms are based on several guidance documents published by the Society of Automotive Engineers (SAE). These include the SAE-AIR-1845 report titled *"Procedure for the Calculation of Airplane Noise in the Vicinity of Airports,"* as well as others which address atmospheric

absorption and noise attenuation. The INM is an average-value-model and is designed to estimate long-term average effects using average annual input conditions. Because of this, differences between predicted and measured values can occur because certain local acoustical variables are not averaged, or because they may not be explicitly modeled in INM. Examples of detailed local acoustical variables include temperature profiles, wind gradients, humidity effects, ground absorption, individual aircraft directivity patterns and sound diffraction terrain, buildings, barriers, etc.

As detailed previously, INM considers multiple airport and aircraft operational and noise propagation variables. The primary inputs into the model include aircraft activity levels, fleet mix, day/night split of operations, flight tracks and runway use.

5.1.2 Noise Contour Development

The noise contours presented in this document were developed using INM Version 7.0a. The contours represent predicted levels, or noise contours, of equal aircraft noise exposure on the ground as expressed in DNL. The FAA currently suggests that three different DNL levels (65, 70, and 75 DNL) be modeled. The Metropolitan Council suggests that the 60 DNL contour be included for airports in an urban environment and the 55 DNL in cases where airports are located outside the Metropolitan Urban Service Area (MUSA).

The Metropolitan Airports Commission (MAC) owns and operates an Airport Noise and Operations Monitoring System (ANOMS) at Minneapolis/St. Paul International Airport (MSP). In addition to monitoring noise levels at 39 noise monitoring poles located around MSP, the system receives flight track data from the FAA radar located at MSP. The flight track data extends to approximately 40 miles around MSP. St. Paul Downtown Airport is located approximately 7.5 miles from MSP. As such, radar flight track data in the vicinity of St. Paul Downtown Airport was provided by ANOMS to aid in the INM input file development process. ANOMS flight track data from 2007 was utilized in the development of the 2007 Baseline INM Inputs. Due to the distance and geography between the FAA radar at MSP and operations in the vicinity of St. Paul Downtown Airport, data acquisition/availability is reduced. However, for 2007 ANOMS reported 29,400 operations in the vicinity of St. Paul Downtown Airport. This provided an adequate data sample for purposes of contributing to the construction of the INM input variables.

The following details the methodology utilized in developing the data inputs for the INM contour modeling.

5.1.2.1 Aircraft Activity Levels

The total number of St. Paul Downtown Airport operations in 2007 was 125,254. As detailed in Chapter 2 the total number of 2007 operations was developed based on the Federal Aviation Administration's (FAA) control tower counts at the St. Paul Downtown Airport. Supplemental ANOMS operations data was used to account for operations during the non-tower hours.

The 2025 preferred alternative forecast number of total operations at St. Paul Downtown Airport is 137,310. The assumptions that were factored in the determination of the 2025 forecasted operations are detailed in Chapter 2 and Appendix A.

5.1.2.2 Fleet Mix

Using the ANOMS flight track data available in the vicinity of St. Paul Downtown Airport for 2007, various data processing steps were taken to develop an actual 2007 fleet mix. The flight track analysis process began by first excluding all MSP carrier jet flight tracks. Then all flight tracks with a start point or end point that did not fall within a 10km radius and 1km (above ground level) ceiling around St. Paul Downtown Airport were filtered out of the data. If the starting point of a track was within the radius/ceiling criteria around St. Paul Downtown Airport it was considered a departure operation. If the endpoint of a track was within the radius/ceiling criteria around St. Paul Downtown Airport it was considered an arrival operation.

The aircraft type distribution derived from the ANOMS flight track analysis was then applied to the 2007 total number of operations to develop the baseline 2007 fleet mix as detailed in Table 5-1.

The 2025 forecast fleet mix at St. Paul Downtown Airport is provided in Table 5-2. The assumptions that were factored in the determination of the 2025 fleet mix are detailed in Chapter 2 and Appendix A.

5.1.2.3 Day/Night Split of Operations

Based on the ANOMS flight track fleet mix data sample for St. Paul Downtown Airport the split of day and nighttime operations was determined. The daytime hours are defined as 7:00 a.m. to 10:00 p.m. and nighttime hours are 10:00 p.m. to 7:00 a.m.

The day/night operations distribution derived from the ANOMS flight track analysis was then applied to the 2007 total number of operations to develop the baseline 2007 day/night split as detailed in Table 5-1.

The 2025 forecast day/night operations at St. Paul Downtown Airport are provided in Table 5-2.

5.1.2.4 Flight Tracks

The Baseline 2007 INM flight track locations were developed based on the flight track trends established by the ANOMS flight tracks that met the fleet mix data sample criteria for St. Paul Downtown Airport. The 2007 INM flight tracks are provided in Figures 5-3(a-i) and the 2007 flight track use is detailed in Tables 5-3(a-d).

The 2025 INM flight tracks are provided in Figures 5-4(a-i) and the 2025 flight track use is detailed in Table 5-4(a-d).

5.1.2.5 Runway Use

Using the St. Paul Downtown Airport fleet mix ANOMS flight track data set, a runway use analysis was conducted. The analysis first included the development of trapezoids off the end of each runway to determine which runway a flight track was operating on. Each trapezoid ran along the axis of the centerline beginning at the runway endpoint and extending 3km from runway end. The trapezoid was 0.1km wide at the runway end point and 1km wide at the extent furthest from the runway end. For the purpose of the runway use analysis the last five, or first five, radar points of each track in the vicinity of St. Paul Downtown Airport were analyzed relative to the runway trapezoids.

In cases where the last five radar points of a track were in the vicinity of St. Paul Downtown Airport, if any one of the radar points were located within a respective runway trapezoid, the track was assigned as an arrival operation on that runway. Conversely, in cases where the first five radar points were in the vicinity of St. Paul Downtown Airport, if any one of the radar points were located within a respective runway trapezoid, the track was assigned as a departure operation on that runway. An operation was considered a “touch & go” if the track was assigned both an arrival and departure at the airport. The resultant runway use trends were then analyzed and adjusted relative to wind pattern data around St. Paul Downtown Airport.

The 2007 runway use derived from the ANOMS flight track analysis is detailed in Table 5-5.

The 2025 forecast runway use at St. Paul Downtown Airport is provided in Table 5-6.

5.1.3 Baseline 2007 Noise Impacts

In the Baseline 2007 noise contours, there are 132 single-family homes and 160 multi-family units located in the 60 DNL contour around St. Paul Downtown Airport. The 60 DNL contour contains approximately 2.14 square miles. The 65 DNL contour contains approximately 0.86 square miles with no residential dwellings in the contour. The 2007 70 and 75 DNL contours contain 0.42 and 0.20 square miles respectively with no residential dwellings in the contours.

The 2007 noise contours are shown in Figure 5-5.

5.1.4 Forecast 2025 Noise Impacts

The Forecast 2025 noise contours around St. Paul Downtown Airport increase to approximately 2.94 square miles in the 60 DNL contour and approximately 1.09 square miles in the 65 DNL contour. The residential structures within the 60 DNL contour increase to 498 single family homes and 666 multi-family units and no residential units are contained in the 65 DNL and greater contours. The 70 and 75 DNL contours increase to cover 0.52 square miles and 0.26 square miles, respectively.

The 2025 noise contours are shown in Figure 5-6.

In summary, there will be a 37.4 percent increase in the 60 DNL contour with an increase of 366 single family homes and 506 multi-family units in the contour. The area within the 65 DNL contour increases 26.7 percent over the same period. The increase in the contours can be attributed primarily to a 9.6 percent increase in total aircraft operations from 2007 to 2025 and a 71.7 percent increase in jet aircraft operations (not including very light jets/microjets).

5.2 Environmental Review

In addition to noise and land use, MAC also reviews projects for other potential environmental concerns. Depending on the type of project, different levels of environmental review may be needed. MAC completes an Assessment of Environmental Effects (AOEE) each year as a part of the Capital Improvement Program. This document identifies projects that have had or require environmental review. For many projects proposed to utilize federal funds, MAC may submit a Categorical Exclusion to the FAA for review and consideration. The environmental topics identified and considered in a “Cat Ex” are listed below. If a project does not meet the requirements for a Cat Ex, a federal environmental assessment (EA) is completed and reviewed/approved by the FAA. Some projects warrant a State Environmental Assessment Worksheet (EAW) as a way to identify and consider any potential environmental impacts. Lastly, projects that involve runway extensions to 5,000 feet at the Reliever Airports require a State and Federal Environmental Impact Statement (EIS).

The type of funding for a project usually dictates what type of review is necessary. For example, projects not using federal funds do not need FAA approval. Also, some projects do not rise to the level of any necessary environmental review.

Specific categories contemplated and/or analyzed in environmental reviews are shown in Table 5-7.

Environmental review for the specific projects listed as recommendations in this LTCP lies outside the scope of a long-term comprehensive planning document and any necessary environmental review will be evaluated as a separate process.

Table 5-7
Environmental Review Categories

Environmental Review Categories	
Air Quality	Historic Structures/Resources
Archaeological	Light Emissions
Biotic Communities	Migratory Birds
Coastal Resources	Natural Resources
Compatible Land Use	Noise Levels
Construction Impacts	Parks, Public Lands, Refuges, Recreational Resources
Endangered Species (flora and fauna)	Relocation Housing
Energy Supply	Social/Socioeconomic Impacts
Environmental Justice	Surface Transportation
Essential Fish Habitat	Water Quality
Farmland	Wetlands
Floodplains	Wild and Scenic Rivers
Hazardous Materials	Other Connected or Cumulative Actions

Chapter

6 Land Use Compatibility

Planning for the maintenance and development of airport facilities is a complex process. Successfully developing airports requires insightful decision-making predicated on various facts that drive the need for the development of additional airport infrastructure. Furthermore, these efforts should consider surrounding community land uses. Airports cannot be developed in a vacuum; the development effort must consider the needs of the surrounding populations and the land uses in the area surrounding the airport. The success of airport planning is predicated on close consideration and coordination of surrounding land use to ensure compatibility with the community surrounding the airport.

Cities and airport operators are both responsible for the ongoing development of public assets. The development of U.S. airports, as well as city infrastructure is within the concept of conducting development predicated on the greater public interest. The responsible development of such community and airport infrastructure requires cooperative efforts on behalf of the airport proprietor and the community.

As city governments are responsible for the development and enhancement of city infrastructure, airport proprietors are responsible for the federally endorsed enhancement of our nation's airport system. Airport operators would be remiss in their duties if such efforts did not consider the land use consequences of decisions made regarding airport development.

This chapter evaluates the land use implications of the planned operation and development of the St. Paul Downtown Airport.

6.1 Land Use Compatibility Criteria

The Federal Aviation Administration has established Land Use Compatibility criteria in 14 C.F.R. Part 150 detailing acceptable land uses around airports considering noise impacts in terms of DNL. In the case of airports located in the Minneapolis/St. Paul Metropolitan Area additional criteria also must be evaluated in relation to noise exposure as established by the Metropolitan Council's Transportation Policy Plan (TPP).

6.1.1 Federal Aviation Administration Land Use Compatibility Guidelines

Federal guidelines for compatible land use that take into account the impact of aviation noise have been developed for land near airports. They were derived through an iterative process that started before 1972. Independent efforts by the FAA, HUD, USAF, USN, EPA and other Federal agencies to develop compatible land use criteria were melded into a single effort by the Federal Interagency Committee on Urban Noise (FICUN) in 1979, and resulted in the FICUN Guidelines document (1980). The Guidelines document adopted DNL as its standard noise descriptor, and the Standard Land Use Coding Manual (SLUCM) as its standard descriptor for land uses. The noise-to-land use relationships were then expanded for FAA's Advisory Circular Airport-Land Use Compatibility Planning. The current individual agency compatible land use criteria have been, for the most part, derived from those in the FICUN Guidelines. Airport environments pertain only to certain categories of these guidelines.[4]

In 1985 the FAA adopted 14 C.F.R. Part 150 outlining land use compatibility guidelines around airports. Table 6-1 provides the land use compatibility guidelines as established by the FAA.

[4] Federal Interagency Committee On Noise (FICON), "Federal Agency Review of Selected Airport Noise Analysis Issues, " (1992), pp. 2-6 to 2-7.

Table 6.1

See following page for Table Key and Notes.

Key

SLUCM	Standard Land Use Coding Manual.
Y(Yes)	Land use and related structures compatible without restrictions.
N(No)	Land use and related structures are not compatible and should be prohibited.
NLR	Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.
25, 30, or 35	Land use and related structures generally compatible; measures to achieve NLR of 25, 30, or 35 dB must be incorporated into design and construction of structure.

Notes

The designations contained in this table do not constitute a federal determination that any use of land covered by the program is acceptable or unacceptable under federal, state, or local law. The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with the local authorities. FAA determinations under Part 150 are not intended to substitute locally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise compatible land uses.

(1) Where the community determines that residential or school uses must be allowed, measures to achieve outdoor to indoor Noise Level Reduction (NLR) of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal residential construction can be expected to provide a NLR of 20 dB, thus, the reduction requirements are often stated as 5, 10, or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR of 25 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(3) Measures to achieve NLR of 30 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(4) Measures to achieve NLR of 35 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(5) Land use compatible provided special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

Source: 14 CFR Part 150

According to FAA standards, areas with noise levels less than 65 DNL are considered compatible with residential development.

6.1.2 Metropolitan Council Land Use Compatibility Guidelines

The Metropolitan Council has developed a set of land-use planning guidelines for responsible community development in the Minneapolis-St. Paul Metropolitan Area. The intent is to provide city governments with a comprehensive resource with regard to planning community development in a manner that considers adequacy, quality and environmental elements of planned land-uses.

Specifically, the Minnesota State Land Planning Act, the underlying law that requires local units of government to prepare a comprehensive plan and submit it for Metropolitan Council review, was enacted in 1976. By 1980, all community plans had been approved. The 1973 Aviation Chapter of the Metropolitan Development Guide was updated in 1977. In 1983, the Metropolitan Council amended the Aviation Policy Plan to include "Land Use Compatibility Guidelines for Aircraft Noise."

In 1994, the Land Planning Act of 1976 had been amended to require communities to update their comprehensive plans at least every ten years. Therefore, all Metropolitan Development Guide chapters were updated by December 1996.

Under the 1976 legislation, communities designated land uses and defined the zoning applicable to the particular land use parcel; the zoning took precedence. The land use measure was a request that local jurisdictions review existing zoning in Airport Noise Zones to determine their consistency with the regional compatibility guidelines, and rezone the property for compatible development if consistent with other development factors. This policy changed in 1994.

Under the amended Land Planning Act, communities determine the land use designation, and the zoning must be consistent with that designation. Thus, the communities had to re-evaluate designated use, permitted uses within the designation, zoning classifications, and adequacy.

In 2004 the Aviation Policy Plan was incorporated into the Transportation Policy Plan (TPP) of the Metropolitan Development Guide. Land use compatibility guidelines for all metropolitan system airports are included in the TPP. It has since been updated in January 2009.

In the case of airports located in the Minneapolis/St. Paul Metropolitan Area, the Metropolitan Council Development Guidelines in relation to airport noise exposure need to be considered. The TPP provides land use guidelines based on 4 noise zones around an airport. The following provides the Metropolitan Council's description of each noise zone:

- **Zone 1** – Occurs on and immediately adjacent to the airport property. Existing and projected noise intensity in the zone is severe and permanent. It is an area affected by frequent landings and takeoffs and subjected to aircraft noise greater than 75 DNL. Proximity of the airfield operating area, particularly runway thresholds, reduces the probability of relief resulting from changes in the operating characteristics of either the aircraft or the airport. Only new, non-sensitive, land uses should be considered – in addition to preventing future noise problems the severely noise-impacted areas should be fully evaluated to determine alternative land use strategies including eventual changes in existing land uses.[5]

[5] Metropolitan Council 2030 Transportation Policy Plan, Appendix L, January 2009.

- **Zone 2** – Noise impacts are generally sustained, especially close to runway ends. Noise levels are in the 70 to 74 DNL range. Based upon proximity to the airfield, the seriousness of the noise exposure routinely interferes with sleep and speech activity. The noise intensity in this area is generally serious and continuing. New development should be limited to uses that have been constructed to achieve certain exterior-to-interior noise attenuation and that discourage certain outdoor uses.[6]

- **Zone 3** – Noise impacts can be categorized as sustaining. Noise levels are in the 65 to 69 DNL range. In addition to the intensity of the noise, location of buildings receiving the noise must also be fully considered. Aircraft and runway use operational changes can provide some relief for certain uses in this area. Residential development may be acceptable if it is located outside areas exposed to frequent landings and takeoffs, is constructed to achieve certain exterior-to-interior noise attenuation, and is restrictive as to outdoor use. Certain medical and educational facilities that involve permanent lodging and outdoor use should be discouraged.[7]

- **Zone 4** – Defined as a transitional area where noise exposure might be considered moderate. Noise levels are in the 60 to 64 DNL range. The area is considered transitional since potential changes in airport and aircraft operating procedures could lower or raise noise levels. Development in this area can benefit from insulation levels above typical new construction standards in Minnesota, but insulation cannot eliminate outdoor noise problems.[8]

- **Noise Buffer Zones -** Additional area that can be protected at the option of the affected community; generally, the buffer zone becomes an extension of noise zone 4. For example, at MSP, a one-mile buffer zone beyond the DNL60 has been established to address the range of variability in noise impact, by allowing implementation of additional local noise mitigation efforts. A buffer zone, out to DNL55 is optional at those reliever airports with noise policy areas outside the Metropolitan Urban Service Area (MUSA).[9]

The listed noise zones also use the DNL noise exposure metric. The Metropolitan Council Land Use Compatibility Guidelines for Aircraft Noise are provided in Table 6-2.

The Metropolitan Council suggests that the 60 DNL contour be used for planning purposes in areas inside the MUSA.

Industrial, Communication, & Utilities	PROV	COMP	COMP	COMP		PROV	COMP	COMP	COMP	
Agriculture, Land/Water Area, & Resource Extraction	COMP	COMP	COMP	COMP		COMP	COMP	COMP	COMP	

Table Key:

- **COMP** – "Compatible" – uses that are acoustically acceptable for both indoors and outdoors.
- **PROV** – "Provisional" – uses that should be discouraged if at all feasible; if allowed, must meet certain structural performance standards to be acceptable according to MS473.192 (metropolitan area Noise Attenuation Act). Structures built after December 1983 shall be acoustically constructed so as to achieve interior noise levels as follows:
  - Residential, Educational and Medical = 45 dBA Interior Sound Level
  - Cultural, Entertainment, Recreational, Office, Commercial, Retail and Services = 50 dBA Interior Sound Level
  - Industrial, Communications, Utility, Agricultural Land, Water Area, Resource Extraction = 60 dBA Interior Sound Level

  Each local governmental unit having land within the airport noise zones is responsible for implementing and enforcing the structural performance standards in its jurisdiction.
- **COND** – "Conditional" – uses that should be strongly discouraged; if allowed, must meet the structural performance standards, and requires a comprehensive plan amendment for review of the project under the Conditional Land Use Review Factors outlined in the Metropolitan Council's 2030 Transportation Policy Plan, Appendix H, Table 5.
- **INCO** – "Incompatible" – land uses that are not acceptable even if acoustical treatment were incorporated in the structure and outside uses restricted.

Source: Metropolitan Council 2030 Transportation Policy Plan, Appendix H – December 15, 2004.

6.1.3 Runway Safety Zones

The State of Minnesota Department of Transportation (Mn/DOT) has established regulations that control the type of development allowed off runway ends in order to prevent incompatible development. These guidelines should be used to establish zoning ordinances to protect areas around an airport. The states zoning areas overlay and extend beyond the Runway Protection Zones (RPZs). The most restrictive areas created by Mn/DOT regulations are called State Safety Zones A and B. The recommended safety zones should exist off each runway end and follow the approach zones out to the total length of the runway. The typical length of Safety Zone A is 2/3 of the total runway length; Safety Zone B is 1/3 of the total runway length and extends from Safety Zone A. There is also an area called Safety Zone C which is circular and typically follows the FAAs FAR Part 77 horizontal surface.

Safety Zone A does not allow any buildings or temporary structures, places of public assembly or transmission lines. Permitted uses include agriculture, livestock, cemeteries and auto parking areas.

Safety Zone B does not allow places of public or semipublic assembly (e.g., churches, hospitals, schools) and is subject to site-to-building area ratios and site population limits. Permitted uses are generally the same as Zone A, plus some low-density developments.

Safety Zone C does not allow use that causes interference with radio or electronic facilities on the airport or interference with radio or electronic communications between the airport and aircraft, lighting that makes it difficult for pilots to distinguish between airport lights and other lights or that results in glare in pilot's eyes, and lighting that impairs visibility in the airport vicinity.

A complete description and copy of the Minnesota Rules Chapter 8800 Department of Transportation Aeronautics Section 2400 Airport Zoning Standards can be found at http://www.dot.state.mn.us/aero/avoffice/planning/zoning.html.

Mn/DOT prefers that airports own all of State Zone A. For land within the area that is not airport-owned, land use protection is recommended by including the safety zones in local zoning codes and zoning maps. Inclusion of the safety zones on community Comprehensive Plans is also strongly encouraged. The RPZs and recommended State Safety Zones for St. Paul Downtown Airport are shown on Figure 6-1.

6.2 Land Use Compatibility Analysis

The St. Paul Downtown Airport is located in Ramsey County, in the City of St. Paul. The airport is bordered by the Mississippi River to the north, south and east and a combination of mixed use commercial, office and industrial/utility land uses to the west. Residential land uses are located northeast and southwest of the airport. The communities of West St. Paul and South St. Paul are located immediately to the south of the airport. In May 2008, a Joint Airport Zoning Board (JAZB) was convened which includes representation from the respective Responsible Governmental Units (RGUs) that control land use development around the St. Paul Downtown Airport. This effort is addressing land uses around St. Paul Downtown Airport in the context of the preferred alternative runway zones and may result in modification to the safety zone dimensions and development restrictions outlined in this chapter.

The following sections detail land use considerations in the context of existing and planned land uses around St. Paul Downtown Airport focusing on airport noise and runway safety zones.

6.2.1 Existing Condition Land Use Compatibility

In general, the area around the airport is primarily water and industrial/utility land uses. The Mississippi River borders airport property to the north, east and south with primarily industrial/utility to the west. A small portion of undeveloped land and retail/commercial also borders airport property to the west.

6.2.1.1 Land Use Compatibility and Airport Noise Considerations

As detailed in Chapter 5, Section 5.1, the 2007 baseline noise contours around St. Paul Downtown Airport contain 132 single-family homes and 160 multi-family units in the 60 DNL.

Figure 6-2 provides the 2007 baseline 60 and greater DNL noise contours around St. Paul Downtown Airport with 2005 land use data provided by the Metropolitan Council. As is detailed on the map, areas of residential use are contained within the 60 DNL noise contour to the north of the airport. The 2007 baseline 65 DNL contour extends off of airport property however, no residential structures are within the contour. The 2007 baseline 70 DNL contour is primarily contained on airport property except for a small portion to the southeast over the Mississippi River and to the northwest over industrial and utility land use areas. The 2007 baseline 75 DNL contour is primarily contained on airport property except for a small portion to the southeast over the Mississippi River.

6.2.1.2 Land Use Compatibility and Existing Runway Protection/Safety Zones

The existing RPZs and State Safety Zones A and B for Runways 14/32, 31/13, and 09/27 at St. Paul Downtown Airport are depicted in Figure 6-3 with the existing land uses around the airport.

The Runway 14 RPZ encompasses 48.9 total acres; 25.5 acres are on airport property, 10.2 acres are undeveloped, 10.0 acres are industrial/utility, 2.3 acres are retail/other commercial and 0.9 acres are water. State Zone A contains 163.7 total acres; 36.8 acres are water, 26.7 acres are park, 26.5 acres are airport property, 22.7 acres are undeveloped, 19.1 acres are industrial/utility, 12.3 acres are retail/other commercial, 10.0 acres are railway and 9.6 acres are major highway. State Zone B contains 130.2 total acres; 33.0 acres are major highway, 26.3 acres are industrial/utility, 17.3 acres are retail/other commercial, 16.8 acres are undeveloped, 14.8 acres are office, 12.2 acres are park, 7.8 acres are railway, 1.1 acres are institutional, 0.5 acres are single family residential, 0.3 acres are multi-family residential and 0.1 acres are mixed use residential. There are 20 single family homes and 14 multi-family units located in State Zone B.

The Runway 32 RPZ encompasses 29.4 total acres; 20.3 acres are water, 5.4 acres are airport property, 2.2 acres are industrial/utility and 1.5 acres are undeveloped. State Zone A contains 163.7 total acres; 63.8 acres are water, 46.6 acres are undeveloped, 23.6 acres are industrial/utility, 19.9 acres are park, 8.6 acres are airport property and 1.2 acres are railway. State Zone B contains 130.2 total acres; 75.4 acres are park, 51.7 acres are water and 3.1 acres are undeveloped.

The Runway 31 RPZ encompasses 13.8 total acres; 10.9 acres are water and 2.9 acres are airport property. State Zone A contains 55.1 total acres; 32.1 acres are industrial/utility, 20.0 acres are water and 3.0 acres are airport property. State Zone B contains 46.0 total acres; 37.3 acres are industrial/utility, 7.5 acres are undeveloped and 1.2 acres are railway.

The Runway 13 RPZ encompasses 13.8 total acres on airport property. State Zone A contains 46.9 total acres; 23.1 acres are airport property, 16.1 acres are industrial, 4.0 acres are undeveloped land and 3.7 acres are mixed use industrial. State Zone B contains 35.8 total acres; 23.9 acres are industrial/utility, 6.0 acres are water, 2.6 acres are undeveloped, 1.7 acres are airport property, 1.4 acres are major highway and 0.2 acres are retail/other commercial.

The Runway 09 RPZ encompasses 8.0 total acres; 2.3 acres are retail/other commercial, 1.8 acres are airport property, 1.7 acres are undeveloped, 1.2 acres are major highway and 1.0 acres are office. State Zone A contains 27.4 total acres; 13.0 acres are industrial/utility, 4.0 acres are undeveloped, 3.3 acres are major highway, 2.3 acres are retail/other commercial, 1.8 acres are airport property, 1.6 acres are office, 0.9 acres are single family residential, and 0.5 acres are institutional. There are 4 multi-family units located in State Zone A. State Zone B contains 23.9 total acres; 6.8 acres are industrial/utility, 6.8 acres are multi-family residential, 3.9 acres are institutional, 3.3 acres are retail/other commercial, 2.8 acres are single family residential and 0.3 acres are undeveloped. There are 13 single family residential structures and 155 multi-family units located in State Zone B.

The Runway 27 RPZ encompasses 8.0 total acres; 6.9 acres are water and 1.1 acres are airport property. State Zone A contains 27.4 total acres; 8.8 acres are water, 7.6 acres are park, 7.2 acres are industrial/utility, 2.7 acres are railway and 1.1 acres are airport property. State Zone B contains 23.9 total acres, all of which are park land.

6.2.2 Preferred Alternative Land Use Compatibility

The preferred development alternative at St. Paul Downtown Airport maintains the existing airport infrastructure and runway lengths. The growth in operations numbers and the forecasted change in fleet mix, primarily an increase in jet operations, results in changes to the noise contour.

6.2.2.1 Forecast Land Use Compatibility and Airport Noise Considerations

As detailed in Chapter 5, Section 5.1, the 2025 preferred alternative forecast 60 DNL noise contour around St. Paul Downtown Airport contains 498 single family homes and 666 multi-family units. The 2025 preferred alternative forecast 65 DNL contour extends off of airport property however, no residential structures are within the contour. The 2025 preferred alternative forecast 70 and 75 DNL contours are almost completely contained on airport property except for small portions that extend to the southeast over the Mississippi River and to the northwest over industrial and utility land use areas.

Figure 6-4 provides the 2025 preferred alternative forecast 60 and greater DNL noise contours around St. Paul Downtown Airport with 2005 land use data provided by the Metropolitan Council. Additional analysis was conducted relative to the planned 2020 land uses around St. Paul Downtown Airport as provided by the Metropolitan Council. Large areas to the south of STP within the 2025 contours is proposed to change from undeveloped to institutional with small areas of industrial and park land use. To the north, industrial and park land uses expand to cover land classified as undeveloped in 2005. West of the airport, there are small changes from industrial/mixed use industrial to commercial and institutional land use types.

The preferred development alternative does not include residential structures in recognized airport noise areas as outlined in the FAA land use guidelines in Table 6-1.

6.2.2.2 Land Use Compatibility and Preferred Alternative Runway Protection/Safety Zones

The preferred alternative RPZs and state safety zones A and B for Runways 14/32, 31/13, and 09/27 at St. Paul Downtown Airport are the same as the 2007 RPZs and zones. They are depicted in **Figure 6-3** with existing land uses around the airport.

Additional analysis was conducted relative to the planned 2020 land uses around St. Paul Downtown Airport as provided by the Metropolitan Council. There is a substantive proposed shift to institutional land use in State Zones A and B for Runways 32 and 31. Large areas of park land, undeveloped land and industrial land change to institutional land use in 2020. Much of the rest of the undeveloped land in State Zones A and B for Runway 32 is proposed to change to park land with the remainder in Zone A changing to industrial land use.

The MAC is in the process of working with a Joint Airport Zoning Board (JAZB) which includes representation from the respective Responsible Governmental Units (RGUs) that control land use development around the St. Paul Downtown Airport. This effort will address land uses around St. Paul Downtown Airport in the context of the Preferred Alternative runway zones and may result in modification to the State Model Safety Zone dimensions and development restrictions. The airport zoning process is spelled out in detail in Minn. Stat. Chap. 360, 360.061 – 360.074 and Minn. Rules Chap. 8800.1200 and 8800.2400. Specifically, Minn. Stat. § 360.062 establishes that "airport hazards" endanger lives, property and airport utility and should be prevented, with consideration given to avoiding the disruption of existing land uses based on social and financial costs. In an effort to prevent the creation or establishment of "airport hazards," the statute states that "the Metropolitan Airports Commission shall request creation of one joint airport zoning board for each airport operated under its authority." The statute states that "A joint board shall have as members two representatives appointed by the municipality owning or controlling the airport and two from the county or municipality, or in case more than one county or municipality is involved two from each county or municipality, in which the airport hazard is located, and in addition a chair elected by a majority of the members so appointed."

The goal of the JAZB is to develop a St. Paul Downtown Airport Zoning Ordinance for review and approval by the Commissioner of Transportation, for subsequent adoption by the Board and then by local municipalities. The Board will determine if the state model zoning ordinance provisions are appropriate for the St. Paul Downtown Airport or if modifications to the model are necessary considering the provisions of Minn. Stat. §360.066, subd. 1. The focus of this discussion has been on the following:

- MnDOT Model Ordinance – Minnesota Rule 8800.2100 and Minnesota Rule 8800.2400 (additional information on the MnDOT Model Zoning Ordinance is available on the Internet at http://www.dot.state.mn.us/aero/avoffice/planning/zoning.html)
- St. Paul Downtown Airport unique characteristics in the context of existing and planned land uses around the airport
- Maintaining a "reasonable standard of safety" while considering the social and financial costs to the community
- Minn. Stat. §360.066, subd. 1, which is especially instructive when addressing the question of balancing the safety with the social and economic impacts in the zoning process.

It is anticipated that a proposed final St. Paul Downtown Airport Zoning Ordinance will be submitted to the Commissioner of Transportation for final approval in 2010.

6.3 Concurrent Use / Development Areas on Airport Property

As described briefly in Chapter 4, MAC is currently analyzing the potential for concurrent use, revenue-generating development at the St. Paul Downtown Airport and all of its Reliever Airports. Any parcels reviewed by MAC at STP will be compatible with the airport and MAC will work with the City of St. Paul to address any concerns. It is anticipated that the northeastern portion of the airport may provide the best opportunities for this type of development.

Chapter

7 Capital Improvement Program Costs

The recommendations included in the 20-year planning period are listed in the table below. The estimated costs are in 2009 dollars, and they include estimated engineering costs.

Table 7-1
LTCP Recommendation Estimated Costs

Recommendation	Estimated Cost
On-going pavement maintenance and replacement program*	$4,400,000
Terminal Sub Drain	$600,000
Electrical Vault Improvements	$700,000
On-going Pavement Joint and Crack Repairs	$100,000 every other year
On-going MAC Building Maintenance	$200,000 every other year
Concurrent Use / Development Parcels	$0 (developer cost)

Source: MAC calculation

* Includes total cost for projects included in the draft 2010 – 2016 Capital Improvement Program for STP pavement rehabilitation or reconstruction.

The recommendation for on-going floodwall maintenance program is not included in the table above. Any costs expended come from the MAC operating budget, and are not Capital Improvement Program (CIP) costs.

Please note that these are recommendations for future airport improvements. Having them listed in this planning document does not guarantee that all or any of them will be completed. Additional engineering and environmental study as necessary will be completed prior to any implementation of projects. This summary provides a guide for MAC when planning the Capital Improvement Program. Costs for Reliever Airport projects must be carefully programmed to ensure all necessary funding is available. Those projects that will be eligible for federal or state funding will be placed in years when the opportunity to receive such funds is greatest. Projects that are not eligible for federal or state funds must have other funding sources identified prior to implementation.

Chapter

8 Facility Implementation Schedule

The items included in the 20-year planning period preferred alternative are listed in the table below. It is expected that these timelines may vary according to the availability of funding sources.

Table 8-1
LTCP Recommendation Implementation Schedule

Recommendation	Estimated Timeline
On-going pavement maintenance and replacement program	Continuous throughout planning period
Terminal Sub Drain	0 – 5 Years
Electrical Vault Improvements	0 – 5 Years
On-going Pavement Joint and Crack Repairs	Continuous throughout planning period
On-going MAC Building Maintenance	Continuous throughout planning period
Concurrent Use / Development Parcels	0 – 10 Years

Chapter 9

Public Information Process

At the onset of this long-term comprehensive plan update process, a public involvement program was developed. It included a specific plan for group meetings, with whom and when. The meetings held as part of this public process are listed in Table 9-1.

The purpose of the meetings was to inform the airport users and the public about the process and schedule, and offer an opportunity for personal question-and-answer sessions. The goal was to receive informal input as the process advanced, and prior to the formal public comment period that took place upon completion of the full draft document. In addition, MAC held two meetings and corresponded regularly with a technical advisory group, made up of members of MAC staff, the FAA, Mn/DOT Aeronautics, and Metropolitan Council.

Informal comments were accepted at all meetings. The MAC committee meetings were open to the public, and verbal comments were invited at each of them. Meetings with the Downtown Airport Advisory Commission (DAAC) typically involved a short presentation by MAC staff followed by a question and answer period.

Table 9-1
LTCP Meeting Schedule

Meeting with:	Date
Downtown Airport Advisory Commission – (DAAC)	January 13, 2009
Airport FBOs	March 5, 2009
Airport Tenants	March 5, 2009
City/County Representatives for communities around STP	March 25, 2009
DAAC	April 14, 2009
Reliever Airport Advisory Committee (RAAC)	April 29, 2009
MAC FD&E Committee Meeting	May 6, 2009
MAC M&O Committee Meeting	May 6, 2009
LTCP Public Informational Meeting	June 23, 2009
MAC FD&E Committee	July 8, 2009
DAAC	July 14, 2009
DAAC	November 10, 2009
MAC FD&E Meeting	February 3, 2010

During the long-term comprehensive planning drafting process, MAC requested informal written or verbal comments regarding the LTCP Update. Advertisement for the MAC public open house meeting was published in the *Pioneer Press* on June 10, 2009. The meeting was held on June 23, 2009. Not one person attended the public meeting. As of December 2009, MAC had received zero written comments.

The draft LTCP document was completed in December, 2009, and made available for a 30-day written comment period starting December 14, 2009. The comment period ended on January 12, 2010. Advertisements for the 30-day public written comment period on the draft LTCP were published in the *Pioneer Press* and *Star Tribune* newspapers on December 10, 2009.

Upon completion of the written comment period, MAC received two letters. One letter submitted came from the West Side Citizens Organization, and the second letter came from a resident of St. Paul. The letters and MAC's responses to them are included in Appendix B.

In February 2010, MAC submitted the draft LTCP document, along with all written comments received and MAC responses to those comments, to the Metropolitan Council for their review. The Metropolitan Council issued their determination in April 2010, finding the LTCP Update consistent with the Metropolitan Council's development guide. Correspondence from the Metropolitan Council has been included in Appendix B.

In June 2010, the Commission took action to adopt this LTCP as the final plan. MAC is committed to preparing updates to this LTCP on a regular basis.

1.0 Executive Summary

The Lower Mississippi River Watershed Management Organization Watershed Management Plan sets the vision and guidelines for managing surface water within its boundaries. This executive summary summarizes the history, purpose, issues, goals, policies, and implementation tasks of the Watershed Management Organization (WMO).

1.1 Location and History

The Lower Mississippi River Watershed Management Organization is located in the southeast part of the Twin Cities metropolitan area, in northern Dakota County and southern Ramsey County. It abuts the south and west sides of the Mississippi River, from the Mississippi River's confluence with the Minnesota River to Rosemount. The location of the WMO is shown in **Figure 1**. Adjoining watershed management entities include Gun Club Lake WMO, Lower Minnesota River Watershed District, and the Vermillion River Watershed Joint Powers Organization. The WMO covers 35,493 acres (55.5 square miles) and is composed of seven cities partially or wholly within the organization's boundaries. The member cities include:

Dakota County	Ramsey County
City of Inver Grove Heights	City of St. Paul
City of Lilydale	
City of Mendota Heights	
City of South St. Paul	
City of Sunfish Lake	
City of West St. Paul	

A joint powers agreement was executed on October 25, 1985, which established and empowered the Lower Mississippi River Watershed Management Organization. The WMO was formed in response to the requirements of the Metropolitan Surface Water Management Act ("Chapter 509," now recodified to Minnesota Statutes 103B). The Act required, among other things, the preparation of watershed management plans in the Minneapolis-St. Paul Metropolitan area.

The WMO has provided a valuable forum for the member cities to evaluate and resolve drainage issues within the watershed. The WMO and its member cities successfully addressed the majority of the intercommunity water management issues that were identified in the past WMO plans. The cooperation of the member cities and the implementation of the WMO's joint powers agreement (JPA) were key factors in resolving the identified problems. The WMO provided the forum for the cities to systemically prioritize and address these and other intercommunity drainage issues. Refer to **Table 6-6** for a list of the completed projects and planning activities.

1.2 Watershed Management Purposes

The WMO developed the following vision statement on December 23, 2009:

> *"Water resources and related ecosystems are managed to sustain their long-term health and integrity through member city collaboration and partnerships with other water management organizations with member city citizen support and participation."*

The general purposes for the 3rd Generation Plan include the following purposes consistent with the Metropolitan Surface Water Management Act and Minnesota Statutes 103B.201.

- Protect, preserve, and use natural surface and groundwater storage and retention systems.
- Minimize public capital expenditures needed to correct flooding and water quality problems.
- Identify and plan for means to effectively protect and improve surface and groundwater quality.
- Establish more uniform local policies and official controls for surface and groundwater management.
- Prevent erosion of soil into surface water systems.
- Promote groundwater recharge.
- Protect and enhance fish and wildlife habitat and water recreational facilities.
- Secure other benefits associated with the proper management of surface and groundwater.

In addition, the WMO has developed the following purposes:

- Assist member cities in achieving current and future water quality and water quantity regulations collaboratively, equitably, and cost-effectively for all members within the watershed.
- Identify and effectively communicate member concerns to other government jurisdictions to better align their policies and activities with those of the WMO and its members.
- Educate citizens about the use, protection, and management of water resources and engage them in WMO water management programs and decision making.

- Consider potential impacts of WMO decisions on natural resources and habitat.

- Govern the WMO with a citizen led Board and keep regulation at the local level – the WMO will not administer a permit program.

- Assist member communities with *intercommunity* runoff and water resource management issues. The WMO, at the discretion of the Board, may also work with individual member cities to address water resource issues within individual city boundaries. This may include but is not limited to monitoring of water bodies or outlets to the Mississippi River.

- Assess performance of the WMO and the member cities toward achieving the goals stated in this plan.

- Provide member cities with useful information about the WMO, its activities, and water resource management.

In an effort to achieve the purposes of the WMO; goals, strategies, and policies have been developed for water quantity, water quality, recreation, fish and wildlife habitat, wetlands, groundwater protection, erosion and sedimentation, education, and WMO administration. These goals, strategies, and policies are provided in **Section 5**.

1.3 WMO Management Structure, Powers, Duties and Agreements

The WMO Board of Managers (Board) consists of seven managers appointed by their respective municipalities. Each city appoints one manager and one alternate to serve at the pleasure of the city. Each manager has one vote, however in certain cases, the JPA provides for a weighted vote system. Regular meetings are held every month on the third Thursday at various member city facilities. The public is invited to attend the WMO Board meetings.

Each year, the Board authorizes and obtains an audit of the WMO's financial records. The Board also reviews and approves an annual budget.

The JPA between the member cities of the WMO went into effect on October 25, 1985. The authority of the WMO is established by Minnesota Statutes 103B and by the JPA. The JPA was revised and restated in 2001. The current JPA is included in **Appendix B**. The powers and duties of the WMO, as stated in the JPA, include, but are not limited to:

1. Prepare and adopt a watershed management plan meeting the requirements of Minnesota Rules Chapter 8410.

2. Review and approve local water management plans as defined in Minnesota Rules Chapter 8410.

3. Review local land use and development at the request of a municipality, in the absence of an approved local water management plan, or for projects requiring a variance from the adopted local water management plan or implementation program.

4. Conduct surveys (or use other information) and develop projects to accomplish the WMO's purposes.

5. Establish and maintain devices for acquiring and recording hydrological and water quality data.

6. Enter upon lands to make surveys and investigations to accomplish the WMO's purposes.

7. Acquire, operate, construct and maintain the drainage system improvements delineated in the capital improvement programs adopted by the WMO Board.

8. Accumulate reserve funds and invest funds not currently needed for WMO operations.

9. Collect money from the WMO members and from any other WMO-approved source.

10. Obtain an annual audit of the books and accounts of the WMO.

11. Make contracts, employ consultants, incur expenses and make expenditures.

12. Enter into contracts or cooperate with governmental agencies, private/public organizations, or individuals to accomplish the WMO's purposes.

13. Contract for or purchase insurance.

14. Adopt an annual general administrative budget.

15. Apportion/allocate costs of capital improvements (including engineering, legal and administrative costs) listed in the WMO watershed management plan, based on "allowable flow" or other cost sharing allocations determined by the WMO Board of Managers.

1.4 Plan Organization

The Lower Mississippi River WMO *Watershed Management Plan* sets the course for the WMO in managing stormwater runoff and the quality of the WMO water resources. The plan outlines the regulations involved, assesses specific and watershed-wide issues, sets goals and policies for the WMO and its resources and lists implementation tasks to achieve the goals. The plan also discusses the financial considerations of implementing the plan and other funding sources that may be available to the WMO and/or its member cities. The WMO plan is organized into the following sections:

Section 1.0 Executive Summary – states the authority and composition of the Lower Mississippi River Watershed Management Organization, the purpose of the Surface Water Management Act and the components of this watershed management plan.

Section 2.0 Land and Water Resource Inventory – presents information about the WMO's climate, precipitation, topography, soils, geology, groundwater, land use, public utilities, surface waters, natural communities and rare species, and pollutant sources. This is the basic information that describes the surface and subsurface conditions of the WMO.

Section 3.0 Agency Coordination – lists many of the agencies that have rules and regulations related to water resources within the WMO.

Section 4.0 Problems and Approaches for Addressing Problems – outlines existing and potential water resource management issues within the WMO and identifies the approaches for improvement for each issue. Approaches for improvement are included in the WMO implementation program.

Section 5.0 Goals, Strategies, and Policies – outlines the purposes of the WMO and the vision for its water resources. This section sets goals for water quantity, water quality, recreation, fish and wildlife habitat, wetlands, groundwater protection, erosion and sedimentation, education, and administration. The goals are followed by strategies and policies that provide methods for achieving goals and serve as decision making guidelines.

Section 6.0 Implementation Program – presents the programs, studies, and capital improvements proposed to address the existing and potential water resource management issues within the WMO. The cost of each implementation element, possible funding mechanism, and the anticipated year for completion is also outlined.

Section 7.0 Impact on Local Government - discusses the conformance of local governmental water resource management plans to this watershed management plan.

Section 8.0 Amendment Procedures - discusses the procedure to be followed should it be necessary to amend this plan. This procedure would be invoked only for major changes that would directly affect water resource management within the member cities.

Section 9.0 References - contains a list of all documents incorporated into this plan by reference or other documents which are referred to in this plan as containing information helpful in the management of WMO water resources.

Section 10.0 Glossary of Acronyms - contains a list and description of acronyms used in this plan.

2.0 Land and Water Resource Inventory

The Lower Mississippi River Watershed Management Organization is surrounded by valuable water and land resources. Protecting and enhancing these important resources is a high priority for the WMO and the surrounding area. Refer to **Figure 1** for a location map of the WMO. Information has been collected regarding land and water resources for the WMO from a variety of sources. This section of the plan provides a general description and summary of the climate, surficial topography, soils, geology, surface and ground water resource data, land use and public utilities, public waters and wetlands, public areas for water-based recreation, fish and wildlife habitat, unique features and scenic areas, pollutant sources, and water resource problem areas. More information can be obtained from Dakota County and Ramsey County websites.

2.1 Climate and Precipitation Data

The Twin Cities metropolitan area climate is a humid continental climate, with moderate precipitation, wide daily temperature variations, warm humid summers and cold winters. The growing season varies from 142 days to 202 days, averaging 166 days. Freezing temperatures may occur until the middle of May and after the middle of September.

The nearest "first order" weather recording station is the Minneapolis/St. Paul Metropolitan Airport Station of the U.S. National Oceanic and Atmospheric Administration. The data from this installation is of highest value and accuracy. The National Weather Service forecast office for the metropolitan area, located in Chanhassen, also records weather data. Several Minnesota State Climatological network stations also exist and provide more detailed local weather data, kept by the Minnesota State Climatologist.

The highest temperature on record at the airport station to date was 108ºF, set in 1936, and the lowest temperature was -34ºF, set in 1936. The extreme conditions tell little except that temperatures range from uncomfortably hot to bitterly cold. The average annual temperature at the airport station is 44.9ºF. Average total annual precipitation at the airport is 29.0 inches (1961-2009 average). **Table 2-1** gives a precipitation summary for the airport station. Generally, the summer precipitation far exceeds that of the winter, the summer rainfall usually being sufficient for proper plant growth. From May to September, the growing months, the average rainfall is 18.0 inches, or about 62 percent of the normal annual precipitation.

Table 2-1. Precipitation Summary – Minneapolis/St. Paul Airport Station

Averages: 1961-2009 Extremes: 1891-2009

Total Precipitation, Inches					Snow, inches		Average # Days with Precip		
Month	Mean	High—Yr	Low—Yr	1-Day Max	Mean	High—Yr	0.1"	0.5"	1"

December	1.03	4.27 1982	0.00 1943	1.50 14/1891	10.6	33.5 1969	3.2	0.6	0.2
Annual	29.03	41.53 2002	11.54 1910	9.15 7/23/87	53.8	101.5 1983	63.5	21.8	9.6

The annual snowfall averages about 54 inches, equivalent to about 5.4 inches of water. The heaviest monthly snowfall recorded to date at the Minneapolis/St. Paul International Airport was 46.4 inches of snow for the month of January 1982. The area averages 40 to 45 days per year when the snow depth is six inches or greater and about 20 days per year when the snow depth is more than 12 inches. Runoff from snowmelt can occur anytime during the winter, but the most severe snowmelt runoff conditions usually occur in March and early April.

Average weather imposes little strain on the typical drainage system. Extremes of precipitation and snowmelt are important for drainage design. The National Weather Service has data on extreme precipitation events that can be used to aid in the design of drainage systems. Extremes of snowmelt most often affect major rivers, the design of stormwater storage areas, and landlocked basins, while extremes of

precipitation most often affect the design of conveyance facilities. Refer to **Figure 2** for the 1% chance of rainfall event (100-year storm) across Minnesota and **Figure 3** for the annual normal precipitation across Minnesota.

There are recent concerns that the increase in urban development and resulting "heat island" effect is contributing to more frequent, high intensity storm events. These storm events can produce large amounts of runoff which may exceed storm sewer designs and result in flooding. Substantial increases of storm events above the 95th percentile since 1950 have been observed, however, only a few regions have enough data to assess such trends. As the average temperature has risen slightly precipitation has also increased[1]. Some Climatologists predict there will be more of an increase in extreme events than mean precipitation[2]. The National Oceanic and Atmospheric Administration (NOAA) Atlas 14 is currently being drafted and is expected to be completed in 2012. This document will take the place of TP-40 for predicting frequency and intensity of rainfall events once it is completed. NOAA Atlas 14 will use only actual rainfall data and will not use predictions to calculate rainfall frequency and intensity estimates.

Additional climatological information can be obtained from the State Climatologist website at http://www.climate.umn.edu/.

2.2 Topographic Data

The WMO topography is characterized by rolling to hilly terrain interspersed with poorly drained depressions that form many ponds and lakes. The Mississippi River bluffs and the ravines that cut through them form the main areas of steep slope. Steep slopes are also found around the ponds and depressions in the southern two-thirds of the watershed. Flat and relatively flat areas can be found along the Mississippi River flood plain and above the bluffs in south and central South St. Paul.

The bluffs, ravines, and other steep slopes are usually wooded or overgrown with underbrush. These steep-sloped areas are not suitable for development. However, they are important because of the wildlife they support and their natural beauty. Erosion can be a problem in areas of steep slope.

Dakota County has two-foot and Ramsey County has one-foot contour interval topographic mapping available. There are also 10-foot contour interval topographic maps available from the U.S. Geological Survey. Refer to **Figure 4** for a contour map showing 10-foot contours across the WMO.

2.3 Soils Data

Soil composition, slope and land management practices determine the effect of soils on stream and lake water quality. Soil composition and slope are important factors affecting the rate and amount of storm water runoff. The shape and stability of aggregates of soil particles—expressed as soil structure—influence the permeability, infiltration rate, and erodibility of soils. Slope is important in determining storm water runoff rates and hence susceptibility to erosion.

Infiltration capacities of soils affect the amount of direct runoff resulting from rainfall. The higher the infiltration rate for a given soil is, the lower the runoff potential. Conversely, soils with low infiltration rates produce high runoff volumes and high peak discharge rates. The hydrologic soil classification map in **Figure 5** shows the estimated distribution of soils as determined by the Natural Resource Conservation Service (NRCS). The five soil classifications are defined as follows:

Group A - These soils have high infiltration rates even when thoroughly wetted. These soils consist chiefly of deep, well drained to excessively drained sands and gravel. Group A soils have a high rate of water transmission, therefore resulting in a low runoff potential.

Group B - These soils have moderate infiltration rates. Group B soils consist of deep moderately well to well drained soils with moderately fine to moderately coarse textures.

Group C - These soils have slow infiltration rates. These soils typically consist of clayey gravel or clayey sand.

Group D - These soils have very slow infiltration. Group D soils are typically clay soils with high swelling potential, soils with high permanent water table, soils with a clay layer at or near the surface, or shallow soils over nearly impervious material.

Urban - These soils have been greatly affected by development and are frequently compacted, cut, and filled, resulting in variable runoff rates and a poor environment for plant growth.

The hydrologic grouping symbols (A-D) are combined with land use and used to estimate the amount of runoff that will occur over a given area for a particular rainfall amount. As land is developed for urban use, much of the soil is covered with impervious surfaces, and soils in the remaining areas are significantly disturbed and altered. Development often results in consolidation of the soil and tends to reduce infiltration capacity of otherwise permeable soils, resulting in significantly greater amounts of runoff.

With the exception of the Mississippi River floodplain, the soils in the WMO generally consist of well-drained soils formed in loamy and sandy glacial till and outwash. The subsoils in the watershed are generally sand. The following is a percentage breakdown of each soil group in the WMO:

Group A – 7.8% **Group B –** 57.6%

Group C – 2.6% **Group D –** 1.0%

Urban – 31.0%

The Dakota County and Ramsey County soil surveys contain maps showing generalized and detailed soils information. The following generalized soil and land descriptions are taken from the county soil maps.

Most of the soil along the Mississippi River is "alluvium," which is either a silty, sandy, or loamy soil on nearly level floodplains or fill material on wet substratum. The mapping unit indicates soils that are nearly level to very gently sloping, generally poorly-drained and located in floodplain areas. In Ramsey County, this soil type is generally covered with fill material 2 feet thick or more. However, this soil is still considered poorly drained because of the underlying poorly drained soil and nearly level land surface.

The "urban land" designation in the City of St. Paul includes the Chetek and Mahtomedi soil groups. The soils have been disturbed and reworked by urbanization. This land can be level or very steep. The soils, generally associated with uplands, tend to be excessively drained with a moderately coarse texture.

The most prevalent general soil type in the WMO is "loamy and sandy soil," which is a combination of the Kingsley-Mahtomedi soil groups. This loamy and sandy soil is well drained and moderately coarse textured. It is found on gently sloping to very steep land, much of it urban, and is also found on uplands.

The "silty, loamy, and sandy soil" unit is the Waukegan/Wadena/Hawick group. It is a silty, loamy and sandy soil, well drained to excessively drained, found on level to very steep land on outwash plains and terraces.

Much of the watershed is urbanized, which changes the character of soil — typically resulting in decreased infiltration rates for sandy areas. Grading, plantings, and tended lawns tend to dominate the landscape in urbanized areas and may become more important factors in runoff generation than the original soil type. The topography of the watershed, characterized by numerous small depressions and steep slopes, causes the watershed to be well drained and the surficial soils to have less impact on runoff generation than would be true for flat or gently rolling terrain.

More information about soils can be obtained from the Dakota County and Ramsey County soil surveys.

2.4 Geology and Groundwater Resources

2.4.1 Geology

The geology of the WMO consists of Quaternary deposits directly overlying Cambrian or Ordovician bedrock formations. This sequence is depicted in the generalized regional stratigraphic column shown in **Appendix C**. The stratigraphic column shows the vertical relationship of the units, their approximate thickness and their water-bearing capabilities.

The subcropping bedrock units in the WMO are the Decorah shale, the Platteville and Glenwood shale, the St. Peter sandstone, the Prairie du Chien dolomite, the Jordan sandstone, and the St. Lawrence shale. Subcropping bedrock is the first bedrock encountered below the overlying soils. The youngest subcropping bedrock units, such as the Decorah shale, occur in the northern part of the WMO, while the older subcropping bedrock units, such as the Jordan Sandstone, occur in the southern part of the WMO. All of these bedrock units are sedimentary rocks deposited by shallow seas during late Cambrian and Ordovician times, approximately 500 million years ago. The bedrock formations form part of a gently sloping bowl-like structure centered under the Minneapolis-St. Paul metropolitan area, known as the Twin Cities basin. The Dakota County and Ramsey County geologic atlases contain more information about the subcropping bedrock units. Refer to **Figure 6** for a map showing the depth to bedrock throughout the watershed.

Glacial deposits of varying thickness cover most of the bedrock in the watershed area. The thickest deposit lies over the extensive buried bedrock valley located in southern Inver Grove Heights. The bedrock valley was carved during the Pleistocene era by advancing and retreating glaciers and by erosion from streams inhabiting the valley during inter-glacial periods. Later, this valley was buried under thick deposits of stream and glacial sand and gravel. The deposits that buried the bedrock valley are approximately 400 feet thick, even 500 feet thick or more in places, while the glacial deposits in the northern and eastern parts of the WMO are less than 50 feet thick, with exposed bedrock along the cliffs of the Mississippi River banks.

2.4.2 Groundwater Resources

Two types of aquifers are present in the Lower Mississippi River WMO: surficial and bedrock aquifers. The following paragraphs provide general information about the aquifers in the WMO. For more information, refer to the Dakota County and Ramsey County geologic atlases, the *Dakota County Groundwater Protection Plan*, and the *Ramsey County Ground Water Quality Protection Plan.* **Figure 7** shows the type and location of the DNR permitted groundwater appropriations sites within the WMO. Updated information on groundwater appropriations is available at http://www.dnr.state.mn.us/waters/watermgmt_section/appropriations/wateruse.html.

Surficial Aquifers

Surficial aquifers are water-bearing layers of sediment, usually sand and gravel, which lie close to the ground surface. Many domestic and some irrigation wells in the watershed draw water from these aquifers. Since the surficial aquifers are more

susceptible to pollution, they are not used for municipal or public supply wells. In some locations in the WMO, the aquifer could provide sufficient water yield for some non-potable industrial uses.

Recharge to the surficial aquifers is primarily through the downward percolation of local precipitation. Some surficial aquifers may also be recharged during periods of high water levels. Surficial aquifers may discharge to local lakes, streams or to the underlying bedrock.

A large number of ponds and lakes are scattered throughout the southern part of the watershed and recharge the groundwater. Many of these water bodies are landlocked and their only outlet is to the groundwater. Some of the landlocked water bodies are probably perched above the regional level of the shallow groundwater in the watershed.

Refer to **Figure 8** for an approximation of the depth to groundwater throughout the watershed. The depth to groundwater was interpolated using known land elevation data and known groundwater elevation information. A groundwater elevation raster (digital image) was created using known lake, wetland, and soil boring information. The depth to groundwater was then calculated by subtracting the groundwater elevations from ground elevations throughout the WMO. Groundwater elevations were then verified using well data from the County Well Index and water table elevation contours from the Ramsey and Dakota County Geologic Atlases. For exact groundwater information it is suggested that soil borings be performed at the desired location.

Bedrock Aquifers

Five major bedrock aquifers are available for water supply in the WMO. The major bedrock aquifers are, in order of use and development: (1) Prairie du Chien-Jordan, (2) Mount Simon-Hinckley, (3) Franconia-Ironton-Galesville, (4) St. Peter, and (5) Platteville. The aquifer used most often for water supply in the area is the Prairie du Chien-Jordan aquifer. The Prairie du Chien-Jordan aquifer is high yielding, more easily tapped than deeper aquifers, has very good water quality and is continuous throughout most of the area.

The groundwater level in the Prairie du Chien-Jordan aquifer varies from less than 700 feet to more than 800 feet above mean sea level as shown in the county geologic atlases. The aquifer is recharged in areas where thin permeable drift overlies the limestone layers. Some recharge of this aquifer occurs locally from percolation through the overlying glacial deposits or St. Peter sandstone. However, hydrogeologic considerations suggest this recharge would be a minimal contribution to the aquifer flow. Regional recharge of the Prairie du Chien-Jordan aquifer occurs to the south, in Freeborn and Mower Counties. Groundwater movement in the aquifer is generally from south to north, toward the Minnesota and Mississippi Rivers. The drift-filled bedrock valley in the southern portion of the area cuts deeply into the Prairie du Chien-Jordan aquifer, creating a direct connection between the aquifer and the surficial groundwater in the glacial drift. Hence, any contamination percolating through the glacial drift in the bedrock valley may enter the bedrock aquifer system.

The aquifer with the highest water quality and highest possible yields is the Mt. Simon-Hinckley aquifer, but it is more expensive to use than the Prairie du Chien-Jordan because of its greater depth and there are limitations to its use. Minnesota statutes limit appropriations from the Mt. Simon-Hinckley aquifer to potable water uses, where there are no feasible or practical alternatives, and where a water conservation plan is incorporated with the appropriations permit. The water level of the Mt. Simon-Hinckley has been nearly constant, having a head of about 700 feet above mean sea level (artesian conditions are most likely present in areas where ground elevations are close to or less than 700 feet). Recharge of the Mt. Simon-Hinckley takes place far north of the watershed, where the bedrock is closer to the surface, and occurs by percolation through the overlying drift and bedrock. Groundwater movement in the aquifer is generally to the southeast. The local direction of groundwater flow in the Twin Cities area tends to be toward the western suburbs, due to pumping of the aquifer.

The City of Inver Grove Heights obtains its municipal water from the Prairie du Chien - Jordan and the Mount Simon Hinckley aquifers, and the City of South St. Paul obtains its water from the Prairie du Chien-Jordan aquifer.

2.5 Land Use and Public Utilities

Figure 9 shows existing land use in the WMO. The land use map shows most of the land use in the watershed is residential, with concentrated areas of commercial development along Robert Street, Highway 110, and Concord Avenue, business and industrial areas along the river, and large amounts of undeveloped land in Inver Grove Heights. **Figure 10** shows the anticipated future land use in the WMO. The land use maps show that most of the land use changes are projected to occur in the southern half of the WMO, in the form of new development. Smaller land use changes, mostly in the form of redevelopment, are anticipated in the remainder of the watershed.

The Cities of Lilydale, Mendota Heights, St. Paul, South St. Paul, Sunfish Lake and West St. Paul are entirely within the Metropolitan Urban Service Area (MUSA). The MUSA is the area delineated by the Metropolitan Council in their *Regional Blueprint*, where urbanization is expected to occur and where metropolitan service systems (particularly sewer and major highways/interchanges) will be provided to accommodate growth. About 44% of the land in the City of Inver Grove Heights lies within the 2010 MUSA boundary. Refer to **Figure 9** for the 2010 MUSA boundary and **Figure 10** for the projected 2030 MUSA boundary in the WMO.

The Cities of St. Paul, Lilydale (supplied by Mendota Heights), Mendota Heights, and West St. Paul obtain their municipal water through the St. Paul Regional Water Utility, which obtains most of its water from the Mississippi River. The Cities of South St. Paul and Inver Grove Heights obtain their municipal water supplies from groundwater aquifers. Areas of large lot development (outside the MUSA) within the City of Inver Grove Heights and a few areas within the City of Mendota Heights and the City of Lilydale are served by private individual wells. Although the City of Sunfish Lake is located within the MUSA, private individual wells and on-site septic systems serve the residents of Sunfish Lake. The City of Sunfish Lake has no plans to provide either public water or sanitary sewer services in the future.

2.6 Surface Water Resource Information

2.6.1 Public Waters (Lakes, Wetlands, Streams, Ditches) and Wetlands

Figure 11 shows the DNR-protected waters located in Lower Mississippi River WMO. As seen in the figure, none of the DNR-protected waters are streams, and there are no public ditches in the WMO. **Figure 12** shows the wetlands identified in the National Wetlands Inventory (NWI) and other water bodies. There may be additional wetlands (especially those smaller than 0.5 acre) in the WMO that are not included in the inventory.

The City of Inver Grove Heights' *Natural Resource Inventory and Management Plan for the Northwest Expansion Area* (2004), *Stormwater Manual for the Northwest Area* (2006), and the *Draft Southwest Area Wetland Inventory and Assessment (2002)* contain an inventory and detailed information about the wetlands located in the City. The City of Inver Grove Heights' 1990 wetland inventory, completed by the Dakota Soil and Water Conservation District, identifies over 350 wetlands 0.5 acres and larger. The City of Mendota Heights' *Local Surface Water Management Plan* (2006) contains an inventory and detailed information about all wetlands in the City. The City of St. Paul completed a *Wetland Management Plan* (2008) to address the wetlands throughout the City.

The following paragraphs present information for some of the water bodies within the WMO. Increased water quality monitoring information is needed to more accurately classify many of the water bodies and to establish water quality trends. Refer to **Appendix D** for the MPCA's inventory of public waters located in the WMO. The table also classifies some of the water body types according to the MPCA's classification system.

Mississippi River

The Mississippi River borders the majority of the Lower Mississippi River WMO and is a significant resource for the area. As the water source for the City of St. Paul, a national "Heritage River", and a national park this area, the water quality of the Mississippi River is of local, regional, state, and national concern. The Mississippi River is the largest river system in the United States and provides essential benefits including but not limited to transportation, recreation, and ecology. The Lower Mississippi River WMO Board recognizes the importance of improving the quality of the stormwater runoff reaching the Mississippi River from the WMO.

There are three reaches of the Mississippi River that border the Lower Mississippi River WMO, each of which is listed as impaired by the MPCA. The first reach (AUID – 07010206-505), from the Minnesota River to the Metro Waste Water Treatment Plant (River Mile 844 to 835), is impaired due to Fecal Coliform (1996), Polychlorinated Biphenyls (PCB) in fish tissue (1998), Perfluorooctane Sulfonate (PFOS) in fish tissue (2008), Turbidity (1998), and Mercury in fish tissue and water column (1998). The second reach (AUID – 07010206-504), from the Metro Waste Water Treatment Plant to Rock Island Railroad Bridge (River Mile 835 to 830), is impaired due to PCB in fish tissue (1998), PFOS in fish tissue (2008), Turbidity (1998), and Mercury in fish tissue and water column (1998). The third reach (AUID – 07010206-502), from the Rock Island Railroad Bridge to Lock & Dam #2 (River Mile

830 to 815.2), is impaired due to PCB in fish tissue (1998), PFOS in fish tissue (2008), Turbidity (1998), and Mercury in fish tissue and water column (1998). The year in parenthesis is the year the reach was placed on the impaired waters inventory. Refer to the MPCA's website for information on individual Total Maximum Daily Loads (TMDL) start and completion dates.

Sunfish Lake (ID #19-0050-00)

Sunfish Lake, a 51-acre lake located in the City of Sunfish Lake, supports some fishing and swimming, but there is no public access or adjoining public parks. The City has no plans to provide public access or acquire adjacent land for parks. Sunfish Lake has a high overflow outlet, constructed in about 1997**,** that carries water to Friendly Marsh and Interstate Valley Creek. The outlet is located above the Ordinary High Water (OHW) elevation, so there is typically no discharge from the lake. Sunfish Lake was listed by the MPCA as impaired due to nutrients/eutrophication biological indicators in 2010 and has a TMDL target start date of 2012 and target completion date of 2014.

Water quality data (including Phosphorus, Chlorophyll, Secchi Disk, Temperature, Total Kjeldahl Nitrogen, Pheophytin-a) is available from 1973, 1984, 1985, 1986, 1991, 1994, 1995, 1997, 2006, 2007, and 2008. Not all parameters are available for each year.

Hornbean Lake (ID #19-0047-00)

Hornbean Lake is a 20-acre lake that straddles the Sunfish Lake/Inver Grove Heights border, just north of I-494. It is surrounded by land that is either currently low density residential or will be low density residential in the future. The lake receives runoff from I-494, in addition to the residential land uses. There is no public access or adjoining public parks and neither City has plans to provide future public access or acquire adjacent land for parks. Phosphorus, Chlorophyll, and Secchi disk data are available from water quality sampling conducted from 1999 to 2008.

Horseshoe Lake (ID #19-0051-00)

Horseshoe Lake is a 15-acre lake that lies in the southeast corner of the City of Sunfish Lake, adjacent to I-494 and Robert Trail. The Horseshoe Lake outlet is located at the southeast corner of the lake; water discharges under 60th Street and flows to small ponds in Inver Grove Heights. The lake is surrounded by land that is either currently low density residential or will be low density residential in the future. There is no public access or adjoining public parks and neither Sunfish Lake nor Inver Grove Heights plans to provide future public access or acquire adjacent land for parks. Phosphorus, Chlorophyll, Secchi disk, Temperature, Total Kjeldahl Nitrogen, and Pheophytin-a data are available from water quality sampling conducted in 2006, 2007, and 2008. The relatively good water quality of Horseshoe Lake indicates the lake is not a major contributor of nutrients to the downstream system.

Seidl's Pond (ID #19-0095-00)

Seidl's Pond is a 4-acre pond located in both South St. Paul and Inver Grove Heights. The lake is surrounded by parkland in both cities, which is heavily wooded with steep topography. Seidl's Pond has no surface water outlet (it is "landlocked").

Phosphorus, Chlorophyll, Secchi disk, Temperature, Total Kjeldahl Nitrogen, and Pheophytin-a data is available from 1993-2008. Not all parameters are available for each year.

Pickerel Lake (ID #19-0079-00)

Pickerel Lake, a 78-acre lake located in Lilydale and St. Paul, is in the Lilydale-Harriet Island Regional Park complex. In addition to the park, land use in the watershed is mostly low density residential. Ivy Falls Creek (and its watershed) discharges into Pickerel Lake. Pickerel Lake also receives drainage from the wetland south of the lake, in the Central Highway 13 watershed. Pickerel Lake discharges to the Mississippi River. When river levels are high enough, the Mississippi River backs up into Pickerel Lake, which can greatly affect the water quality of the lake. Pickerel Lake was listed as impaired due to mercury by the MPCA in 2010 and is part of the state-wide TMDL for mercury.

There is a public access on the lake. Improvements including fish stocking, a nature/interpretive center, a parking area, and other public improvements are proposed for completion in 2011. There is minimal water quality data available for Pickerel Lake; however, the MPCA used volunteers to assess water quality in Pickerel Lake in 2010 and 2011.

Simley Lake (ID #19-0037-00)

Simley Lake is an 11-acre lake located in Inver Grove Heights. There is a small city park, comprised of the island in the middle of the lake. Access to the park is limited to a pedestrian trail to the island. There is no public access on the lake. Land use in the watershed includes a high school, commercial, and residential land uses. Most of the watershed is developed. Phosphorus, Chlorophyll, Secchi disk, Temperature, Total Kjeldahl Nitrogen, and Pheophytin-a data is available from 1995-2002. Not all parameters are available for each year.

Dickman Lake/Loch Gregor (ID #19-0046-00)

Dickman Lake/Loch Gregor is a 20-acre lake located in northwestern Inver Grove Heights. The lake's tributary area is primarily from Inver Grove Heights but also includes a small portion of the City of Sunfish Lake, between I-494 and Robert Trail. There is no outlet from Dickman Lake/Loch Gregor. Existing land use in the watershed includes low density residential, park land, and undeveloped land. Future land use in the watershed will convert the undeveloped land to low density residential land use. There are no parks or public access on the lake. Water quality data (Phosphorus, Chlorophyll, Secchi disk, Temperature, Total Kjeldahl Nitrogen, Pheophytin-a, pH, Dissolved Oxygen, Total Suspended Solids, Turbidity) is available for this lake from 1996 and 1997, which indicates the lake is hypereutrophic. The WMO also monitored the Lake in 2010.

Thompson Lake (ID #19-0048-00)

Thompson Lake is a 7-acre lake located in the City of West St. Paul. Thompson Lake is the centerpiece for the popular Thompson County Park. The area has numerous trails, a fishing pier, a community center, and a picnic shelter. Monitoring performed by the City of West St. Paul and Dakota County has determined that lake

sediments contain concentrations of polycyclic aromatic hydrocarbons (PAHs) at levels that prevent reuse of the sediment on residential or industrial properties. A feasibility study needs to be completed to address the PAHs and help determine the upstream source of the pollution. The County and City are working to secure funding to remove the sediment with high PAH concentrations.

Rogers Lake (ID #19-0080-00)

Rogers Lake, a 107-acre lake located in Mendota Heights, formerly supported a public swimming beach and is popular among local residents for panfish fishing. Although there is no public access on this lake, there is a City park on the lake with picnic grounds, trails, and play areas that also provides opportunities for non-motorized boating. Land uses in the watershed are highway, low density residential and park land. Outflows from the lake reach Friendly Marsh and Interstate Valley Creek. Phosphorus, Chlorophyll, Secchi disk, Temperature, and Total Kjeldahl Nitrogen data is available for this lake from 2009.

Marcott Lakes (IDs #19-0042-00, #19-0041-00, #19-0040-00, #19-0039-00)

There are no public access points or adjoining park land for any of the Marcott chain of lakes in Inver Grove Heights. Land use in the watershed is currently a mixture of low density residential, highway, and undeveloped land. The undeveloped land is proposed to be low density or rural density residential in the future. Water quality data is available for Marcott (Rosenberger) Lake (DNR #19-0041), a 22-acre lake at the north end of the chain. Based on data from 1995, 1996, 1997,1998, 2000, 2001 and 2002, the lake water quality is very good. Highway runoff and slope failures have threatened the water quality of Rosenberger Lake in the past. Secchi disk transparency data is available for 27-acre Marcott Lake II (Ohman's Lake, DNR #19-0042) for 1988 and 1989 and water quality data (Phosphorus, Chlorophyll, Secchi disk, Temperature, Total Kjeldahl Nitrogen, Pheophytin-a, pH, Dissolved Oxygen, Total Suspended Solids, Turbidity) is available from 1997.

Schmitt Lake (ID #19-0052-00)

Schmitt Lake is a 57-acre lake located in northern Inver Grove Heights, near the intersection of I-494 and Robert Trail South. There is no public access on the lake. Fishing for northern pike and bluegills is popular at Schmitt Lake. Existing land use in the watershed includes commercial, low and high density residential, and undeveloped land. The WMO monitored Schmitt Lake in 2010. Phosphorus, Chlorophyll, and Secchi disk data is available from 2010.

Golf Course Pond (ID #19-0049-00)

This 14-acre pond is located in Inver Grove Heights. Southview Country Club is adjacent to the pond. Other land uses in the watershed include mostly low density residential, with a small amount of medium density residential. There is no public access on the pond. The only water quality data available are Secchi disk transparencies for 1988, which show the pond to be hypereutrophic.

Other Water Bodies: McGroarty Pond (ID #19-0035-00), Gun Club Pond (#19-0245-00), City Hall Pond (#19-0267-00)

These water bodies, located in Inver Grove Heights, are managed by the DNR's Fishing in the Neighborhood (FiN) Program. For more information on these water bodies and other water bodies managed by the Fishing in the Neighborhood Program refer to the DNR's website www.dnr.state.mn.us.

2.6.2 Water Resources Monitoring Information

Water quality monitoring data is available for: Sunfish Lake, Horseshoe Lake, Hornbean Lake, Seidl's Pond, Dickman Lake, Golf Course Pond, Pickerel Lake, Simley Lake, Marcott Lakes, and Rogers Lake. See **Figure 13** for monitoring locations throughout the WMO. Most of the data was obtained from MPCA's EQUIS Database, including Metropolitan Council's Citizen Assisted Monitoring Program (CAMP) monitoring results. The monitoring at Seidl's Pond, Simley Lake, and Marcott (Rosenberger) Lake was completed under the Metropolitan Council's CAMP. Refer to **Appendix E** for a summary of monitoring information for water bodies in the WMO. More detailed monitoring information can be found online at http://www.dnr.state.mn.us/lakefind/index.html or at the Environmental Data Access system on the MPCA website; http://www.pca.state.mn.us.

2.6.3 2010 List of Impaired Waters (Section 303d)

The MPCA prepares a list of streams and lakes that are not meeting their intended beneficial uses (impaired waters, or 303(d) list). For water bodies on the impaired waters list, the state will be establishing a total maximum daily load (TMDL). To establish a TMDL, a study must be completed that identifies the relative contribution of all point and nonpoint sources of each pollutant that contributes to the impairment of the water body, and develops an implementation plan that reduces pollutant loads so the water body meets designated uses. As of 2010, the Minnesota Pollution Control Agency lists the following water bodies within the WMO as being impaired and the nature of the impairment is shown in parenthesis:

- Sunfish Lake *(Nutrients/Eutrophication Biological Indicators)*
- Pickerel Lake *(Mercury)*
- Mississippi River from the Minnesota River to the Metro Waste Water Treatment Plant, River Mile 844 to 835 *(Fecal Coliform, PCB, PFOS, Turbidity, Mercury)*
- Mississippi River from the Metro Waste Water Treatment Plant to Rock Island Railroad Bridge, River Mile 835 to 830 *(PCB, PFOS, Turbidity, Mercury)*
- Mississippi River from the Rock Island Railroad Bridge to Lock & Dam #2, River Mile 830 to 815.2 *(PCB, PFOS, Turbidity, Mercury)*

Figure 13 shows the impaired waters and the location of monitoring sites listed on the MPCA website.

The MPCA has not monitored for all water quality parameters or all water bodies, so there may be other water bodies considered impaired once an increased monitoring effort has been completed and they are assessed.

2.6.4 Stormwater System, Hydrologic Data, and Flooding Information

Figure 14 shows the major subwatersheds in WMO and labels the subwatersheds based on outlet status to the Mississippi River and whether or not the subwatershed is within more than one member city. The watersheds are grouped as follows:

Group A – Watershed to Mississippi River outlet that encompasses more than one city. An example is the Simon's Ravine subwatershed in South St. Paul and West St. Paul.

Group B – Watershed to Mississippi River outlet that includes only one city. An example is the South St. Paul 2 subwatershed in South St. Paul.

Group C – Watershed that currently has no outlet to the Mississippi River (landlocked), and no outlet is planned for the next 10 to 20 years. An example is the Barnes Avenue subwatershed in Inver Grove Heights.

Table 2-2 lists the subwatersheds and their areas.

Table 2-2. Major Subwatersheds in Lower Mississippi River WMO

Subwatershed Name	Area, in Acres
"A" Subwatersheds – Intercommunity subwatersheds with existing outlet to the Mississippi River	
Interstate Valley Creek	4,251
Highway 13	728
Ivy Falls Creek	708
Riverview	3,493
Simons Ravine	1,426
Wentworth Street	639
South Grove	1,016
Highway 110-494	3,078
Old Village	511
"B" Subwatersheds – Non-intercommunity subwatersheds with existing outlet to the Mississippi River	
South St. Paul 1	150
South St. Paul 2	277
South St. Paul 3	1266
Skyline Village	427
Arbor Pointe	1021
Mississippi River	901
Eagan	324
Simley Lake	566
Rosemount	443
Gun Club Lake	39
"C" Subwatersheds – Non-intercommunilty subwatersheds with no outlet to the Mississippi River planned for 10-20 years (landlocked)	

Subwatershed Name	Area, in Acres
Babcock Trail	1,174
Valley Park	427
Inver Grove Trail	426
Barnes Avenue	440
South Marcott Lakes	698
Northwest	2,466
Rich Valley	1,598
Argenta Trail	101
Albavar Path	155
Jefferson Trail	33
110th Street	2,534
Pine Bend	796

Hydrologic modeling results for each member city are contained in their water management plans: Inver Grove Heights (2008), Lilydale (2008), Mendota Heights (2006), Saint Paul (2006), South St. Paul (2004), Sunfish Lake (2009), and West Saint Paul (2006). More detailed information on the drainage within each member city can be found in these plans and can be obtained by contacting the city of interest.

Hydrologic modeling results are also available for the following intercommunity studies and projects: Highway 110-494 watershed, Simon's Ravine, Ivy Falls Creek, East Lexington Avenue, Mayfield Heights Road, and Akron Avenue. These modeling results are stored electronically and are revised/updated on an as-needed basis. This hydrologic information is available from the WMO's engineer.

Flooding information can be found in the member cities' local water management plans, along with detailed information about stormwater ponds. Additional flood information is available from the Flood Insurance Studies (FIS) for some of the WMO communities. Refer to **Figure 15** for the 100-year and 500-year FEMA floodplain locations.

2.7 Public Areas for Water Based Recreation and Access

There are numerous water bodies (see **section 2.6.1**) and parks within or near the WMO which offer recreational activities such as walking, biking, fishing, and boating. A number of recreational resources and opportunities are outlined below:

Parks: Year-round, people utilize the amenities of popular area parks. Thompson County Park, Pickerel Lake Regional Park, Seidl's Lake Park, Kaposia Park, and many others throughout the watershed are visited frequently.

Fishing/Boating: Fishing and boating are popular activities throughout the watershed. Many fishing piers are located on ponds, lakes, and along the Mississippi River. Canoeing and kayaking is also a popular form of recreation and exercise at many water bodies across the watershed. There are no public facilities on any of the basins in the

WMO for launching boats, so access is limited for those who do not live adjacent to a water body.

Trail Systems: Walking, biking, and jogging are common activities on the numerous trail systems located at area parks, along the river, and throughout the watershed.

Additional information regarding recreational opportunities within the WMO is available at the member cities' web sites.

2.8 Fish and Wildlife Habitat

The WMO contains habitat for a variety of small mammals, fish, reptiles, birds, amphibians, and insects. Maintenance of habitat for wildlife species is important in maintaining ecological stability of the WMO's natural areas. Information from the DNR indicates there is a variety of unique plant and animal life within the WMO, much of which is located in or around the area water bodies.

There are many different species of fish located in the Mississippi River and area lakes. Fish sampling information can be obtained to determine the species of fish in a given river or lake. This information can be found at www.dnr.state.mn.us/lakefind/index.html. The Mississippi River is an especially popular fishery. The DNR reports there may be over 125 species present in Pool 2 (from Ford Dam in St. Paul to the Hastings Dam) and attracts many anglers fishing for walleye, sauger, catfish, and white bass.

2.9 Unique Features

2.9.1 Scenic Areas

Scenic areas include State designated Scientific and Natural Areas, designated Scenic Areas, and Historic Areas. The WMO contains many lakes and wetlands that are the centerpiece for many scenic areas and parks. It is bordered by the Mississippi River on the entire north and east boundaries. The Katherine Ordway Natural History Study Area is adjacent to the Mississippi River, in southeast Inver Grove Heights. Other important park areas include Thompson County Park in West St. Paul and Dodge Nature Center in Mendota Heights.

2.9.2 Natural Communities and Rare Species

The Minnesota DNR Natural Heritage Information System from 2011 was queried for the WMO. The Minnesota DNR conducts the Minnesota County Biological Survey (MCBS), which identifies natural communities and rare species. The Natural Heritage Information System shows the presence of rare species in WMO along the Mississippi River in Lilydale, South St. Paul, St. Paul, and Inver Grove Heights. The survey also shows the presence of rare species in the Cities of West St. Paul and Inver Grove Heights separate from the Mississippi River corridor. In addition, there are 16 native plant communities including mesic prairies, dry sand prairies, and black ash seepage swamps within the WMO boundary. These surveys are evidence of the ecological importance of the Mississippi River corridor and critical habitats within the

member cities. **Figure 16** shows the location of MCBS Native Plant Communities and Scientific and Natural Areas.

The presettlement vegetation in the WMO consisted of river bottom forest along the Mississippi River, and as a mixture of oak openings and barrens, upland deciduous forest, and brush prairie. **Figure 17** shows the presettlement vegetation.

2.9.3 Mississippi National River and Recreational Area (MNRRA) and Mississippi River Corridor Critical Area (MRCCA)

The Minnesota State Legislature enacted the Critical Areas Act in 1973 and an executive order (79-19) was signed in 1976 declaring the Mississippi River corridor a Critical Area. The executive order states the following purposes for the Critical Area designation:

1. To protect and preserve a unique and valuable state and regional resource for the benefit of the health, safety and welfare of the citizens for the state, region, and nation;
2. To prevent and mitigate irreversible damage to this state, regional and national resource;
3. To preserve and enhance its natural, aesthetic, cultural, and historical value for the public use;
4. To protect and preserve the river as an essential element in the national, state and regional transportation, sewer and water and recreational systems; and
5. To protect and preserve the biological and ecological functions of the corridor.

The MRCCA includes 72 miles of the river, extending from the Cities of Dayton and Ramsey to just south of the City of Hastings. The boundary of the MRCCA can generally be described as from the river bluff down to the river, with the corridor width varying. The Cities of Inver Grove Heights, Lilydale, Mendota Heights, St. Paul, and South St. Paul are affected by the state Critical Areas Act and the federally designated MNRRA. **Figure 18** shows the MRCCA boundary in relation to the WMO.

In 1976, four corridor districts were established, corresponding to the following different types of land use along the Mississippi River: rural open space district, urban developed district, urban open space district, and urban diversified district. Each district has its own set of guidelines. The Critical Area Act requires that each city having jurisdiction over land within the Critical Area develop a Critical Area Plan. Executive Order 79-19 includes the rules and guidelines that each city must incorporate in its Critical Area Plan.

In 1988, the U.S. Congress designated the Mississippi River corridor as the MNRRA, a unit of the national park system. The boundaries of the MNRRA corridor are the same as the Critical Area corridor. MNRRA was established to:

1. Protect, preserve, and enhance the significant values of the Mississippi River corridor through the Twin Cities metropolitan area;
2. Encourage coordination of federal, state, and local programs; and

3. Provide a management framework to assist the state of Minnesota and local governments in the development and implementation of integrated resource management programs and ensure orderly public and private development in the area.

The Mississippi River Coordinating Commission and the National Park Service adopted the MNRRA *Comprehensive Management Plan* in 1995. This plan adopts and incorporates by reference the state Critical Area Program, Shoreland Management Program, and other applicable state and regional land use management programs. The MNRRA comprehensive plan also identifies voluntary policies that are additional to the Critical Area requirements, for the purpose of protecting and enhancing river resources. The earlier Critical Area requirements are referred to as Tier 1 criteria, whereas the additional voluntary guidelines in the MNRRA comprehensive plan are referred to as Tier 2 criteria. Although city conformance with Tier 2 criteria is not mandatory, conformance to Tier 2 criteria is necessary to receive federal grants for land acquisition and development. All of the member cities within the MNRRA corridor have comprehensive plans that conform to Tier 1 criteria, but there are varying levels of conformance with Tier 2 criteria.

In 2009 the Minnesota State Legislature directed the DNR to conduct new rulemaking for the MRCCA. The boundary of the existing corridor is not anticipated to change, however the boundaries and requirements within the corridor are expected to change. The adoption of updated rules will be mandatory by the local government units (LGUs) located within corridor boundaries. New rules for the MRCCA are in the process of being drafted and are expected to be completed shortly after the adoption of this plan.

2.10 Pollutant Sources

The MPCA identified the following types and number of environmentally contaminated sites within the WMO:

1. MPCA's List of Permitted Solid Waste Facilities (SWPERM) – 16 sites
2. MPCA's 1980 Metropolitan Area Waste Disposal Site Inventory (MDI), unpermitted dumpsites – 25 sites
3. MPCA's Voluntary Investigation and Cleanup (VIC) Unit List – 95 sites
4. MPCA's Sites Delisted from Permanent List of Priorities (DPLP) – 3 sites
5. U.S. EPA's No Further Remedial Action Planned (NFRAP) Sites, removed from CERCLIS by U.S. EPA – 8 sites
6. MPCA's Closed Landfill Sites Undergoing Cleanup – 1 site

The MPCA also identified approximately 250 reported underground storage tank leaks within the WMO.

Refer to **Figure 19** for approximate location of possible pollutant sources throughout the WMO. More information can be obtained by contacting the MPCA or going to www.mpca.state.mn.us and searching "What's in my neighborhood". The MPCA should be contacted for site-specific details.

Dakota County initiated the Site Assessment and Site Response Program to inventory, identify, evaluate and restore contaminated sites. This program complements existing State and Federal programs.

The highways in the WMO (i.e. I-35E, I-494, Highway 52, and Highway 55) present potential environmental hazards. For example, a spill on Interstate 494 could result in pollution of Schmitt Lake since the lake is located immediately adjacent to the roadway. The MPCA's spill reports show that spills have occurred in the past on Interstate 494 and Highways 52 and 55 within the WMO.

Other potential pollutant sources include industrial, office, commercial, residential and other highly impervious land uses. Stormwater runoff from these land uses could carry pollutants into the stormwater system (nonpoint source pollution), especially if there are direct inlets into the storm sewer system that do not drain first into a stormwater pond. Facilities within these land use types may be covered by a NPDES General Industrial Stormwater Permit, which requires preparation of stormwater pollution prevention plans (SWPPP) to prevent nonpoint source pollution. In addition, each member city is part of the MPCA's MS4 (Municipal Separate Storm Sewer System) program. Each member city is required to have a city wide SWPPP as part of the MS4 program requirements. Refer to the MPCA's website for the most up to date information regarding these programs.

2.11 Water Resource Problem Areas

A number of water resource problem areas, issues or concerns were identified within the WMO. The problem areas were identified through information obtained from the Technical Advisory Committee (TAC) and the Citizen Advisory Committee (CAC). Each site was analyzed and potential solutions to address the problems were developed, as detailed in **Section 4**. Refer to **Figure 20** for the location of site-specific problem areas. The following is a list and brief description of some of the water resource problem areas in the WMO.

1) Stream bank erosion along the Mississippi River – Improvements are needed to stabilize erosion-prone areas and reduce sediment loading to the river.

2) Pickerel Lake Regional Park for BMPs and Improvements – Improvements are needed to enhance water quality and provide access to high quality recreational areas.

3) PAHs present in Thompson Lake Sediments – Increased modeling and source determination needs to be completed to address PAHs.

4) Impaired Waters – The MPCA has identified Sunfish Lake, Pickerel Lake, and three reaches of the Mississippi River as being impaired.

5) Debris and Floatables at Simley Lake – Source of pollution and maintenance responsibilities need to be addressed.

6) Flooding and Erosion at Marie Ave/Dodd Rd. – Improvements need to be constructed to address erosion and reduce flood potential.

7) Erosion along Ivy Falls Creek at Thompson Ave/Delaware Ave – Feasibility study and improvements are needed to address erosion problems.

8) Erosion at Golf Course Pond – Continued monitoring of the erosion problem is needed along with potential constructed improvements.

9) Water Quality in Hornbean Lake – Implementation of BMPs in the Hornbean Lake watershed is needed to minimize the impacts of upstream development.

There are most likely additional problem areas located throughout the WMO that have yet to be identified due to a lack of monitoring. These problem areas will be identified and addressed as additional monitoring occurs.

3.0 Agency Cooperation

There are a number of local, state, and federal agencies that have rules and regulations related to water resource management. The WMO recognizes the roles of these other agencies and will cooperate, coordinate, and when possible partner with these agencies.

This Plan is in conformance with but does not restate all other agency rules that are applicable to water resource management. The following agencies deal with or regulate water resources throughout the WMO:

- Minnesota Department of Health www.health.state.mn.us
- Minnesota Pollution Control Agency www.pca.state.mn.us
- Board of Water and Soil Resources www.bwsr.state.mn.us and the Wetland Conservation Act www.bwsr.state.mn.us/wetlands/wca/index.html
- Minnesota Department of Natural Resources www.dnr.state.mn.us
- US Army Corps of Engineers www.mvp.usace.army.mi
- Minnesota Department of Agriculture www.mda.state.mn.us
- US Fish and Wildlife Service www.fws.gov
- Dakota County www.co.dakota.mn.us
- Dakota County Soil and Water Conservation District www.dakotacountyswcd.org
- Ramsey County www.co.ramsey.mn.us
- Ramsey County Soil and Water Conservation District www.co.ramsey.mn.us/cd/index.htm
- Minnesota Environmental Quality Board www.eqb.state.mn.us
- Metropolitan Council www.metrocouncil.org
- National Park Service www.nps.gov

While these other agencies' rules, policies, and guidelines are not all restated in this Plan, they are applicable to projects, programs, and planning within the WMO. The MPCA Minnesota Stormwater Manual, which is a document intended to be frequently updated, is also incorporated by reference into this Plan and can be found at www.pca.state.mn.us/water/stormwater/stormwater-manual.html.

4.0 Problems and Approaches for Addressing Problems

This section contains an assessment of existing and potential water resource-related problems within the WMO. These problems have been identified from analysis of the land and water resource data collected during the preparation of this Plan, through information provided by the WMO, information from the member cities, information obtained at the public open house, and contributions from the TAC and CAC. A description of existing and potential problems within the WMO has been listed along with potential corrective actions. The WMO implementation plan containing future planning and projects is presented in **Tables 6-1, 6-2, 6-3, 6-4**, and **6-5.** Projects and studies completed by the WMO and member cities that resolved problems and issues identified in previous plans can be found in **Table 6-6**.

Refer to **Figure 20** for the location of site-specific problem areas.

4.1 Water Quality Problems and Issues

Problem 4.1.A: The following water bodies located in the WMO have been listed as impaired by the Minnesota Pollution Control Agency:

- Sunfish Lake *(Nutrients/Eutrophication Biological Indicators)*
- Pickerel Lake *(Mercury)*
- Mississippi River from the Minnesota River to the Metro Waste Water Treatment Plant, River Mile 844 to 835 *(Fecal Coliform, PCB, PFOS, Turbidity, Mercury)*
- Mississippi River from the Metro Waste Water Treatment Plant to Rock Island Railroad Bridge, River Mile 835 to 830 *(PCB, PFOS, Turbidity, Mercury)*
- Mississippi River from the Rock Island Railroad Bridge to Lock & Dam #2, River Mile 830 to 815.2 *(PCB, PFOS, Turbidity, Mercury)*

Approach for Addressing Problem 4.1.A: The WMO and affected member cities shall work with the MPCA and other relevant agencies to address impairments, develop TMDLs, and implement TMDL plans. The WMO and its member cities shall also be prepared to incorporate the provisions of the South Metro Mississippi TSS TMDL and the Upper Mississippi River Bacteria TMDL once they are completed. The WMO will be affected by both of these implementation plans that are anticipated to be completed during the ten year life-cycle of this plan.

The mercury TMDL is a statewide study that was completed by the MPCA in 2007. Over 90% of the mercury deposition in the state originates beyond the boundaries of the State of Minnesota. The federal government will be responsible for meeting its reduction goal, while the State of Minnesota needs a 93% reduction from 1990 levels by 2025 to meet its share. The MPCA will work with an Implementation Oversight Group and Minnesota entities that release mercury into the environment.

Monitoring has not been completed for all water quality parameters or all water bodies within the WMO. As a result, other water bodies may be added to the impaired waters list once an increased monitoring effort has been completed.

Problem 4.1.B: Increased water quality monitoring is needed to better classify DNR protected water bodies in the WMO and to help establish water quality trends.

Approach for Addressing Problem 4.1.B: The WMO will work with member cities to develop a monitoring program to collect water quality data for water bodies throughout the WMO. Monitoring will be determined annually and by the WMO budget. The data collected, combined with historic data will be used to classify water bodies, establish water quality trends, and determine areas where improvements are necessary to preserve and enhance resources. The WMO may conduct monitoring, require the local governments to conduct monitoring, or seek other means to complete these monitoring activities.

The WMO may also work with the MPCA to monitor water bodies as part of the MPCA's Watershed Approach Program.

Problem 4.1.C: There is not enough data to understand the quality of water reaching the Mississippi River through stormwater outfalls and streams.

Approach for Addressing Problem 4.1.C: The WMO will work with member cities to develop a monitoring program to monitor select outfalls to the Mississippi River. Monitoring will be determined annually and by the WMO budget. This monitoring effort will help identify point source locations for pollutant loadings to the river and will help establish high priority areas for water quality improvements and BMP implementation. This will also help identify the most cost-effective locations to construct water quality capital improvements.

Problem 4.1.D: The efficiency and effectiveness of many stormwater BMPs in the watershed is unknown.

Approach for Addressing Problem 4.1.D: MPCA's Minimal Impact Design Standards (MIDS) Project, once complete, should be utilized to help determine the effectiveness of BMPs within the WMO. Refer to http://www.pca.state.mn.us for more information and updates on the MIDS Project.

The WMO may also monitor certain BMPs throughout the WMO to determine their effectiveness. This may be accomplished through the use of grant funding or volunteers.

Problem 4.1.E: There are increased algae blooms due to excessive nutrients in many lakes, rivers, and ponds.

Approach for Addressing Problem 4.1.E: Stormwater BMPs shall be implemented by member cities to reduce both point source and non point source pollutants and reduce the impact of development on the water quality of water bodies in the WMO. Retrofits of existing BMPs shall also be performed where feasible and applicable during redevelopment. Increased education and public awareness of housekeeping BMPs will be a focus of the WMO and member cities to improve the quality of surface waters in the WMO.

Problem 4.1.F: Water quality in Hornbean Lake may be negatively impacted by future development in Inver Grove Heights and Sunfish Lake.

Approach for Addressing Problem 4.1.F: BMPs shall be implemented by Inver Grove Heights and Sunfish Lake as development occurs to reduce negative impacts on Hornbean Lake and other resources downstream of the development.

Problem 4.1.G: Presence of polycyclic aromatic hydrocarbons (PAHs) in Thompson Lake.

Approach for Addressing Problem 4.1.G: A feasibility study should be completed to address the PAHs and help determine the upstream source of the pollution. Dakota County and West St. Paul are working to secure funding to remove sediment having high PAH concentrations.

Problem 4.1.H: Accumulation of debris and floatables at Simley Lake.

Approach for Addressing Problem 4.1.H: The WMO will investigate the source of the pollution and will establish maintenance responsibilities of Simley Lake in effort to address the problem.

Problem 4.1.I: The ability of member cities to efficiently address requirements of new NPDES and MS4 Permits.

Approach for Addressing Problem 4.1.I: Develop education and public outreach programs that address member city NDPES and MS4 Permit requirements. Investigate the cost and efficiency of assisting member cities with MS4 Permit renewals.

4.2 Flooding and Stormwater Rate Control Concerns

Problem 4.2.A: Increased impervious areas that result from development or redevelopment and other land use practices cause increased rates and volumes of stormwater runoff which may result in downstream flooding, erosion, sedimentation, and water quality problems.

Approach for Addressing Problem 4.2.A: Strengthen the WMO's current Low Impact Development (LID) encouragement policy and rate control and volume control goals while taking into consideration development and redevelopment conditions. Focus on performance standards rather than prescriptive standards for water quality improvements.

The WMO shall also utilize the MPCA's MIDS Project, once it has been completed, to help determine appropriate and effective BMPs for certain development and redevelopment conditions.

Problem 4.2.B: The WMO has a number of landlocked basins that need to be evaluated on whether they will require an outlet or remain landlocked.

Approach for Addressing Problem 4.2.B: WMO and member cities will evaluate landlocked basins of interest. If there are no flooding concerns, no outlet will be necessary. If the area does flood or could cause flood problems in the future, the WMO and member cities will investigate the option of providing an outlet for the area which will protect adjacent land uses and not adversely impact downstream resources.

Problem 4.2.C: Establishing appropriate minimum building elevations to prevent the flooding of structures located adjacent to flood-prone areas and landlocked basins.

Approach for Addressing Problem 4.2.C: Member cities shall establish minimum building elevations above the critical 100-year flood elevation. The cities need to consider the effects of larger storms and plugged outlet conditions when they set these elevations. In situations such as landlocked basins or ponds with large tributary watersheds, additional freeboard above the 100-year flood elevation may be required. The cities also need to provide emergency overflows for ponds and inundation areas to address plugged outlet conditions and the effects of larger floods.

Problem 4.2.D: Flooding and erosion at Marie Avenue/Dodd Road.

Approach for Addressing Problem 4.2.D: Feasibility study has been completed for this problem area. Improvements need to be constructed to address the flooding and erosion problems.

Problem 4.2.E: Rate control and streambank erosion in the Interstate Valley Creek Watershed north of Marie Avenue.

Approach for Addressing Problem 4.2.E: Feasibility study and project shall be completed to address rate control issues and provide streambank stabilization north of Marie Avenue in the Interstate Valley Creek Watershed.

Problem 4.2.F: Drainage issues in Lilydale east of the intersection of Lexington Avenue and Sibley Memorial Highway (Trunk Highway 13) have resulted in flooding at the Lexington-Riverside Condominiums (1101 Sibley Memorial Highway), ongoing sedimentation and erosion problems within the highway right-of-way and on Lexington-Riverside property, and gullying and erosion problems along the Mississippi River bluffs.

Approach for Addressing Problem 4.2.F: A feasibility study to investigate this problem was completed in 2010. Recommended improvements include plugging the west culvert under Trunk Highway 13 and diverting water eastward through a ditch and culvert on the south side of Trunk Highway 13, construction of a new outlet from the Lexington-Riverside Pond, construction of a new storm sewer system to convey flows from the pond to the existing storm sewer, and addressing hillside erosion on the Overlook Condominiums Property. The Cities of Lilydale and Mendota Heights, along with MnDOT, Dakota County, and the Lexington-Riverside Condo Association are anticipated to participate in the cost share for this project. More information can be found in the *Lexington Avenue-Trunk Highway 13 Drainage and Erosion Feasibility Study* which can be found on the WMO's website.

Problem 4.2.G: Seidl's Pond, a landlocked basin in South St. Paul, experiences high water levels and periodic flooding.

Approach for Addressing Problem 4.2.G: A feasibility study to address this problem was completed in 2004. Construction of an outlet and a lift station is necessary to reduce drainage and flood potential of the area. More information can be found in the feasibility study which can be obtained by contacting the WMO.

Problem 4.2.H: The storm sewer system on Dawn Way in Inver Grove Heights is susceptible to surcharge as a result of insufficient capacity to convey storm water runoff

from the upstream drainage area. The upstream drainage area consists of the South St. Paul Airport and portions of Inver Grove Heights.

Approach for Addressing Problem 4.2.H: Hydrologic analysis and cost split analysis have been completed for potential Dawn Way storm sewer system improvements. The Cities of Inver Grove Heights and South St. Paul will construct the necessary improvements to address the existing drainage problems and provide additional capacity to the Dawn Way storm sewer system.

4.3 Impacts of Water Resource Management on Recreation

Problem 4.3.A: The WMO has limited public access to high quality lakes and park areas for recreational activities.

Approach for Addressing Problem 4.3.A: The WMO and member cities will investigate opportunities to implement access points and construct improvements to improve access to high quality water resources in the area. An example of this is the improvements currently underway at Pickerel Lake Regional Park to increase access and provide an enhanced recreation area.

4.4 Impacts of Wetland Loss on Fish and Wildlife Resources

Problem 4.4.A: Due to densely developed areas in the WMO, some member cities may have less opportunity than others to take advantage of wetland banking and restoring fish and wildlife resources.

Approach for Addressing Problem 4.4.A: The WMO will evaluate and pursue locations to conduct wetland restoration opportunities. These locations may serve as a wetland bank for member communities within the WMO and thus increase fish and wildlife resources within the WMO.

4.5 Impacts of Erosion and Sedimentation on Water Resources

Soil erosion can be a significant sediment source to water resources throughout the WMO, resulting in decreased water depth and degraded water quality. Erosion also impacts stormwater rates and volumes. As soil erodes, vegetation is removed from the ground surface, which results in increased rates of stormwater runoff. Erosion also results in channelization of stormwater flow, increasing the rate of stormwater runoff.

Problem 4.5.A: There are many areas along the Mississippi River, within the boundary of the WMO, that are experiencing stream bank erosion. This erosion results in a large sediment load to the river.

Approach for Addressing Problem 4.5.A: The WMO will work with the U.S. Army Corps of Engineers to identify the exact location and extent of the erosion problems. The WMO will reference the DNR's *River Restoration Guidelines*, once completed, when developing improvement options. Improvements will then need to be constructed to stabilize erosion-prone areas and reduce sedimentation of the river.

Problem 4.5.B: The need for consistency in erosion control inspection and design requirements.

Approach for Addressing Problem 4.5.B: Conduct and/or facilitate joint certification training for member city staff on designing and inspecting erosion control plans and erosion control measures.

Problem 4.5.C: Erosion along Ivy Falls Creek at the intersection of Thompson Avenue and Delaware Avenue.

Approach for Addressing Problem 4.5.C: Feasibility study and project need to be completed to address erosion problems along Ivy Falls Creek.

Problem 4.5.D: Sedimentation of stormwater ponds reduces storage volume capacity, decreases stormwater treatment ability, and can result in flooding.

Approach for Addressing Problem 4.5.D: WMO and member cities shall develop a maintenance program for pond maintenance and maintenance of all BMPs to avoid these potential issues. Determination of excess sources of sediment or other loadings will be a component of this maintenance program.

Problem 4.5.E: Golf Course Pond, in northern Inver Grove Heights, has severe erosion around the entire shore of the pond, but the erosion may be the result of a high water table, and not the result of wave action or runoff.

Approach for Addressing Problem 4.5.E: The WMO and City of Inver Grove Heights will need to monitor the problem and determine if action is required.

Problem 4.5.F: There are shoreland vegetation and erosion problems on various water bodies in the WMO.

Approach for Addressing Problem 4.5.F: Evaluate DNR protected water bodies with potential or known problems within the WMO and pursue shoreland restoration projects where needed.

4.6 Impact of Land Use Practices and Development on Water Resources

Problem 4.6.A: There is a need for groundwater management and protection in the WMO.

Approach for Addressing Problem 4.6.A: The WMO and member cities shall encourage infiltration in suitable areas to provide groundwater recharge and stormwater volume control. Infiltration shall not be allowed in areas with potential contamination, drinking water supply management areas, and wellhead protection areas. Infiltration will not be encouraged where soils are not suitable for infiltration or where there is less than three feet of separation between the bottom of the infiltration system and the groundwater or bedrock.

4.7 Public Education

Problem 4.7.A: The public needs more education on issues facing the water resources in their community and how they impact water quality.

The current WMO education program consists of the annual WMO newsletter, which the member cities distribute, and the annual activity report, which is submitted to BWSR and is available to residents upon request.

The cities use a variety of methods to educate their residents about stormwater management issues. Some of these methods include: storm drain stenciling, door hangers, newsletters, and newspapers and other media to distribute water resource and stormwater management information. Member cities are also involved in Dakota County's Wetland Health Evaluation Program (WHEP) which uses volunteers to assess the biological health of wetlands.

Approach for Addressing Problem 4.7.A: Expand the WMO's education and public involvement efforts to provide more assistance to the member cities. The WMO shall implement a marketing strategy throughout the WMO that helps change social behavior in regards to stormwater and water quality. The WMO will also investigate the creation of a committee to focus on education and public outreach. Refer to **Section 5.8** for details regarding the new components of the WMO education program.

4.8 Administrative Issues

Problem 4.8.A: Some grants and funding is only available to watersheds or similar organizations.

Approach for Addressing Problem 4.8.A: Assist member cities in pursuing/securing grants to assist in implementation of their Local Water Resource Management Plans.

Problem 4.8.B: Implementation of the evaluation criteria contained in the BWSR performance standards.

Approach for Addressing Problem 4.8.B: Redirect administrative resources to address BWSR performance standards such as data practices policy, project and program expenditures, Board training, operational guidelines, water quality and watershed yield trends, and public information and education outcomes.

Problem 4.8.C: Need to improve collaboration of WMO/WD and County ideas and programs to maximize efficiency throughout the WMO.

Approach for Addressing Problem 4.8.C: Explore opportunities to partner with other WMO/WD programs and County programs.

Problem 4.8.D: The WMO is required to have a Board that contains all citizen members.

Approach for Addressing Problem 4.8.D: The WMO will pursue the transition of its Board to an all citizen member Board.

Problem 4.8.E: Expansion of Technical Advisory Committee (TAC) membership and participation.

Approach for Addressing Problem 4.8.E: Revise JPA to broaden membership of formal TAC beyond county and SWCD staff to include member city staff and others.

Problem 4.8.F: There are concerns that the current electronic and GIS boundary of the WMO does not reflect the existing Joint Powers Agreement watershed boundary.

Approach for Addressing Problem 4.8.F: The WMO will compare legal documents from the Joint Powers Agreement and the existing GIS watershed boundary to verify the appropriate limits of the WMO.

Problem 4.8.G: Lack of citizen involvement and participation in dealing with processes, education, and issues throughout the WMO.

Approach for Addressing Problem 4.8.G: The Board will investigate implementation of a permanent CAC. The CAC would be utilized as an advisory group to the Board and would provide watershed-wide input on items such as water resource problems and strategies to improve education.

4.9 Adequacy of Existing Programs

Problem 4.9.A: The water body classification system (Categories I-V) used by the WMO since their Second Generation Plan (2001) does not align with the MPCA's water body classification system and water quality monitoring protocol.

Refer to **Appendix F** for a description of the former classification categories along with the water bodies that were classified by the WMO and the member cities.

Approach for Addressing Problem 4.9.A: The WMO will use a similar water body classification system to that of the MPCA. Refer to **Table 5-1** located in **Section 5.3.2.I** for the table that will be used to help classify water bodies as deep lakes, shallow lakes, wetlands, and ponds. The pond column has been added to the MPCA's table by the WMO to provide a classification for water bodies that may be considered ponds.

The classification system determines whether a water body should be managed as a deep lake, shallow lake, wetland, or pond. For water bodies classified as wetlands, member cities must use a wetland management classification system that takes into account the susceptibility of the wetlands to degradation by stormwater. The WMO requires the member cities use a wetland classification system that ranks the wetlands and sets wetland management standards based on the rank and desired level of protection. **Table 5-2** in **Section 5.3.2.I** shows the WMO's water quality goals based on classification.

Problem 4.9.B: The WMO does not currently have a uniform water quality cost allocation formula for inter community projects.

The WMO does have "allowable flow" which is the flowrate that an upstream community can discharge to a downstream community without incurring financial obligation for the stormwater management system in the downstream community. The allowable flow is intended to represent the flows from the tributary watershed under natural/pre-development conditions. Discharges from the upstream community in excess of the allowable flow obligate the upstream community to share in the cost of the stormwater management system, in accordance with the formulas in the joint powers agreement. The September 1985 Joint Powers Agreement sets forth the method for calculating allowable flow. **Appendix B** includes a copy of the joint powers agreement and memoranda regarding allowable flow.

Approach for Addressing Problem 4.9.B: The WMO will attempt to develop a water quality cost allocation formula. The WMO will also review the current allowable flow methodology and verify that no revisions are necessary.

Problem 4.9.C: Maintenance of Stormwater System - The stormwater system within the WMO includes pipes, constructed ponds, lakes, wetlands, ditches, swales and other drainageways. Proper maintenance of the stormwater system will ensure that the system provides the necessary flood control and water quality treatment. Many units of government are responsible for maintaining the stormwater systems within the WMO and need to perform this maintenance on a regular basis. For example:

- MnDOT is responsible for maintaining the storm sewers, ponds, culverts, etc. located along I-494, I-35E, Highway 55, Highway 52, Highway 156, Highway 110, and Highway 3.

- Dakota County is responsible for maintaining only the "mainline" culvert crossings in their county roads; member cities are currently responsible for maintaining storm sewer catch basins and leads in the county roads (e.g. County Road 73-"Babcock Trail", County Road 75-"Cahill Avenue", and County Road 26-"70th Street").

- Ramsey County is responsible for maintaining storm sewer catch basins and leads in the county roads (e.g. County Road 63-"Delaware Avenue").

- Member cities are responsible for maintaining their stormwater system in accordance with the requirements of the MPCA SWPPP Program.

- Owners of private stormwater facilities are responsible for maintaining their facilities in proper condition, consistent with the original performance design standards.

For stormwater systems constructed using WMO cost share monies, member cities may request reimbursement from the WMO for maintenance activities, according to the WMO cost share formula since the new JPA has other cost share methods.

Approach for Addressing Problem 4.9.C: Maintenance responsibilities shall be carried out by the appropriate organizations listed above. Member cities are to fulfill their requirements and notify the WMO or other regulatory agencies should they know of maintenance deficiencies.

4.10 Availability and Adequacy of Existing Information to Manage Water Resources

Problem 4.10.A: Several intercommunity drainage issues had persisted unresolved for decades prior to the establishment of the WMO. The WMO and its member cities successfully addressed the majority of the intercommunity water management issues identified in past plans. The cooperation of the member cities and the implementation of the WMO's Joint Powers Agreement (JPA) were key factors in resolving many of the identified problems.

Approach for Addressing Problem 4.10.A: The WMO will continue to update the implementation plan and prioritize and address water resource issues as they arise.

5.0 Goals, Strategies, and Policies

The WMO has developed a number of purposes for the management of the watershed and its water resources. These purposes have been developed to be consistent with the vision of the WMO, as well as, to meet the requirements of the Metropolitan Surface Water Management Act. In addition, many goals, strategies, and policies have been outlined to help achieve the purposes of the 3rd Generation Watershed Management Plan.

5.1 Watershed Management Purposes

5.1.1 Lower Mississippi River WMO Purposes (3rd Generation)

The WMO developed the following vision statement on December 23, 2009:

> *"Water resources and related ecosystems are managed to sustain their long-term health and integrity through member city collaboration and partnerships with other water management organizations with member city citizen support and participation."*

The general purposes for the 3rd Generation Plan include the following purposes consistent with the Metropolitan Surface Water Management Act and Minnesota Statutes 103B.201.

- Protect, preserve, and use natural surface and groundwater storage and retention systems.
- Minimize public capital expenditures needed to correct flooding and water quality problems.
- Identify and plan for means to effectively protect and improve surface water and groundwater quality.
- Establish more uniform local policies and official controls for surface and groundwater management.
- Prevent erosion of soil into surface water systems.
- Promote groundwater recharge.
- Protect and enhance fish and wildlife habitat and water recreational facilities.
- Secure other benefits associated with the proper management of surface water and groundwater.

In addition, the WMO has developed the following purposes:

- Assist member cities in achieving current and future water quality and water quantity regulations collaboratively, equitably, and cost-effectively for all members within the watershed.

- Identify and effectively communicate member concerns to other government jurisdictions to better align their policies and activities with those of the WMO and its members.

- Educate citizens about the use, protection, and management of water resources and engage them in WMO water management programs and decision making.

- Consider potential impacts of WMO decisions on natural resources and habitat.

- Govern the WMO with a citizen-led Board and keep regulation at the local level – the WMO will not administer a permit program.

- Assist member communities with *intercommunity* runoff and water resource management issues. The WMO, at the discretion of the Board, may also work with individual member cities to address water resource issues within individual city boundaries. This may include, but is not limited to, monitoring of water bodies or outlets to the Mississippi River.

- Assess performance of the WMO and the member cities toward achieving the goals stated in this plan.

- Provide member cities with useful information about the WMO, its activities, and water resource management.

To achieve the purposes of the WMO, the following goals, strategies, and policies have been developed for water quantity, water quality, recreation, fish and wildlife habitat, wetlands, groundwater protection, erosion and sedimentation, education, and administration.

WMO Goals: Desired outcomes to help achieve the vision of the WMO and the purposes of this plan.

WMO Strategies: Activities the WMO will undertake to help achieve their goals.

WMO Policies: Standards that have been developed that require specific action of the member cities to help achieve the goals of the WMO.

These goals, strategies, and policies have been developed to complement member city, county, regional, and state goals and policies. Pursuant to State Statute, member cities shall update their local plans (if necessary) within two years of WMO adoption of this plan.

An implementation plan has been developed that outlines the estimated completion dates and timelines of the WMO's measurable outcomes and activities. The implementation plan is located in **Section 6**.

5.2 Water Quantity

The WMO recognizes the importance of minimizing effects of development and redevelopment to reduce existing and avoid future water resource problems. The following goals and policies have been developed to address volume control, rate control, flooding, and other water quantity related issues.

5.2.1 WMO Goals

A. Reduce stormwater runoff volumes by increasing infiltration and ground water recharge.

B. Reduce existing flood occurrences and minimize future flood potential throughout the WMO.

5.2.2 WMO Strategies

A. The WMO will establish stormwater volume reduction requirements taking into consideration variable development and redevelopment conditions. This may include establishing LID policies to provide increased volume control for development and redevelopment projects. (Goal 5.2.1 A, Goal 5.2.1 B)

B. The WMO will continue to use the previously established intercommunity "design flows" (stormwater flow rates that the stormwater management system is expected to convey with fully developed conditions in the watershed) as the design parameters for downstream improvements. The WMO will also continue to use the previously established "allowable flows" (stormwater flow rate that an upstream community can discharge to a downstream community without incurring financial obligation for the stormwater system in the downstream community) as the basis for determining the financial obligation of member cities for intercommunity flooding and erosion control projects. Refer to **Appendix B** for the joint powers agreement and memoranda regarding established intercommunity design flow (allowable flow). (General Water Quantity)

C. The WMO will coordinate intercommunity stormwater runoff design and planning with the member communities by:

- Reviewing the member cities' local watershed management plans for consistency with WMO goals and consistency with intercommunity planning.
- Calculating the cost apportionment between cities for water resources projects with intercommunity participation. (General Water Quantity)

D. The WMO will consider practicable solutions when involved with intercommunity water resources planning activities.

- All drainage studies or feasibility studies (whether by the WMO or a city) for projects in a subwatershed with intercommunity drainage, shall consider the impact of the project and the total intercommunity project cost.
- Any projects with intercommunity drainage issues shall not be implemented without prior completion of a feasibility study outlining improvement options and adoption of a preferred option by the WMO, except in emergencies. (General Water Quantity)

5.2.3 WMO Policies

A. Member cities are to reduce the amount of impervious surfaces through the use of Low Impact Development (LID) techniques to the greatest extent reasonable for new development and redevelopment projects, taking into consideration land use, zoning, topography, previous site uses, and site constraints. LID techniques may include, but are not limited to, those presented on the MPCA-Low Impact Development website, http://www.pca.state.mn.us/water/stormwater/stormwater-lid.html. (Goal 5.2.1 A, Goal 5.2.1 B)

B. Member cities will not be allowed to use infiltration as a stormwater BMP in areas where there are known contaminants or in drinking water supply management areas/wellhead protection areas. In addition, infiltration will not be encouraged where the soils are not suitable for infiltration or in areas where there is less than three feet of separation between the bottom of the infiltration system and the groundwater or bedrock. In-situ field tests shall be required to verify the infiltration rates of on-site soils prior to the construction of infiltration BMPs. (Goal 5.2.1 A, Goal 5.6.1 A)

C. Member cities are to provide pretreatment of stormwater prior to discharge to any new infiltration system to protect the functionality of the system. Pretreatment shall collect sediment, skim floatables, and be easily accessed for inspection and maintenance. (Goal 5.2.1 A, Goal 5.6.1 A)

D. The level of protection along all trunk conveyors, streams, and channels and around all wetlands, ponds, detention basins, and lakes shall be based on the critical duration 100-year event, which shall be defined as the 100-year, 24-hour rainfall or the 100-year, 10-day runoff event; whichever is greater. (Goal 5.2.1 B)

E. Design of new trunk stormwater systems should provide discharge capacity for the critical-duration runoff event that is not less than a 10-year frequency event. For open channel conveyance construction, the design criteria shall be for the critical 100-year event. Variances to this standard may apply in areas where in-place storm sewers are designed for a 5-year frequency event. (Goal 5.2.1 B)

F. Design of new non-trunk stormwater systems should provide discharge capacity for the critical-duration runoff event that is not less than a 5-year frequency event, preferably a 10-year frequency event (level of service). Where the planned level of service would cause hardship in operation of a downstream system, the owner may design for a lesser level of service if the following circumstances are present:

- The proposed new or replacement system will not have a longer life than that of the existing downstream system.
- It is not practical to incorporate temporary measures into the new system to mitigate the effects of the new system on the downstream system. (Goal 5.2.1 B)

G. Member cities are to ensure that proposed development, redevelopment, and/or infrastructure projects will not exceed the capacity of the existing downstream stormwater drainage system. (Goal 5.2.1 B)

H. Member cities are to incorporate emergency overflow structures (e.g. swales, spillways), where feasible, into pond outlet structure designs to prevent undesired flooding resulting from storms larger than the 100-year (one percent) event or plugged outlet conditions. (Goal 5.2.1 B)

I. Member cities are to maintain ordinances or policies that allow the cities to secure easements over floodplains, detention areas, wetlands, ditches, and all other parts of the stormwater system as areas develop or redevelop. (Goal 5.2.1 B)

J. Member cities are to incorporate multi-stage outlets into their pond designs to control flows from smaller, less frequent storms and help maintain base flows in downstream open channels, where practicable. (Goal 5.2.1 B)

K. Member cities are to maintain ordinances or policies that set minimum building elevations at least one foot above the critical 100-year flood elevation for structures adjacent to inundation areas. The cities should consider the effects of events larger than the 100-year flood when setting minimum building elevations. Higher minimum building elevations should be considered for structures adjacent to ponding areas with large tributary watersheds and for structures adjacent to landlocked basins. (Goal 5.2.1 B)

L. The WMO establishes the following policies regarding landlocked basins:

- The flood levels established in local (city) watershed management plans shall take into consideration the effects of water level fluctuations on trees, vegetation, erosion and property values. Steeply sloped shorelines that are subject to slope failure and shoreline damage should not be in contact with flood water for extended periods of time. (Goal 5.2.1 B)

- Only the existing tributary area may discharge to a landlocked basin, unless provision has been made for an outlet from the basin, or hydrologic analysis has been completed showing additional discharge to basin is acceptable. The form of outlet may range from temporary pumps to gravity storm sewers. The outlet is to be in place before increased water levels are likely to affect vegetation, slope stability and adjacent properties. (Goal 5.2.1 B)

- If outlets from landlocked basins are needed, member cities are encouraged, where practicable, to keep outflow rates low enough to allow for as much infiltration as possible. Drawdown time to within one foot of the normal water level should not exceed 48 hours to reduce damage to upland vegetation. (Goal 5.2.1 B)

- When member cities establish high water elevations and whether outlets are needed for landlocked basins, member cities are encouraged, where practicable, to account for long duration events, such as multiple-year wet cycles and high runoff volume events (e.g. snowmelt events that last for many weeks). (Goal 5.2.1 B)

- Member cities need to consider both the water quality and flooding impacts of proposed outlets from landlocked basins on downstream water resources. (Goal 5.2.1 B)

M. Member cities are to require developers to provide Runoff Control Plans prepared by a licensed professional engineer for projects that disturb one or more acres of land. The Runoff Control Plan shall incorporate best management practices (BMPs) and shall conform to approved local water management plans.

Runoff Control Plans shall include the following:

a. Property lines and delineation of lands under ownership of the project proposer.

b. Delineation of the subwatersheds contributing runoff from off-site, and proposed and existing subwatersheds on-site.

c. Location, alignment and elevation of proposed and existing stormwater facilities.

d. Delineation of existing on-site wetlands, shoreland and/or floodplain areas. Removal or disturbance of streambank and shoreland vegetation should be avoided. The plan shall address how unavoidable disturbances to this vegetation will be mitigated.

e. Existing and proposed normal, 5-year (or 10-year) and 100-year water elevations on-site.

f. Existing and proposed site contour elevations related to the North American Vertical Datum (NAVD) of 1988.

g. Construction plans and specifications of all proposed stormwater management facilities.

h. Stormwater runoff volume and rate analyses for existing and proposed conditions.

i. All hydrologic and hydraulic computations completed to design the proposed stormwater quantity and quality management facilities.

j. Provision of outlots or easements for maintenance access to detention basins, constructed wetlands and other stormwater management facilities.

k. Maintenance agreement between developer and city which addresses sweeping, pond inspection, sediment removal and disposal, etc.

l. Documentation indicating conformance with the city's existing local water management plan.

m. Inlets to detention basins, wetlands, etc. shown at or below the normal water level.

n. Identification of receiving water body.

Runoff Control Plans shall meet the following criteria:

- The peak rate of stormwater runoff from the developed subwatershed of the site shall not exceed the existing peak rate of runoff for the 5-year (or 10-year) and the 100-year return frequency critical duration storm events (encouraged to maintain the runoff rate for the 2-year storm event as well). For the purposes of this criteria, "subwatershed" may be the project site, or may be an area of greater size for which an approved local water management plan meets this criteria (e.g. regional detention basins).

- A hydrograph method based on sound hydrologic theory shall be used to analyze stormwater runoff for the design or analysis of flows in conveyors, streams, and channels and flows to ponds and wetlands.

- Reservoir routing procedures and critical duration 100-year runoff events shall be used for design of detention basins and outlets. (Goal 5.2.1 B)

5.3 Water Quality

There are many water bodies throughout the WMO that are valuable resources to the people of the area. The following goals and policies have been developed to maintain or improve water quality in surface waters throughout the WMO.

5.3.1 WMO Goals

A. Evaluate and track water quality trends within the WMO.

B. Improve intergovernmental coordination regarding water quality management within the WMO.

C. Improve water quality within the WMO.

5.3.2 WMO Strategies

A. The WMO will assist member cities in creating an equitable and cost-effective method to address the requirements of the South Metro Mississippi TMDL study and implementation plan and other TMDLs as they are completed. (Goal 5.3.1 B)

B. The WMO will continue to focus on the water quality of intercommunity water bodies. The WMO, at the discretion of the Board, may also work with individual member cities to address water quality issues within individual city boundaries. (Goal 5.3.1 C)

C. The WMO will investigate the possibility of coordinating joint member contracts for maintenance to achieve economies of scale. Post construction stormwater management and good housekeeping practices for MS4 stormwater facilities shall comply with MPCA/MS4 requirements. (Goal 5.3.1 B)

D. The WMO will monitor DNR protected water bodies. Prioritization of water bodies for monitoring will be determined annually and by the WMO budget. Monitoring data

from CAMP (Citizen Assisted Monitoring Program), WHEP (Wetland Health Evaluation Program), and CSMP (Citizen Stream Monitoring Program) should be taken into consideration so monitoring information is not being duplicated. (Goal 5.3.1 A)

E. The WMO will monitor select storm sewers and streams that outlet to the Mississippi River. Prioritization of storm sewers and streams will be determined annually and by the WMO budget. Monitoring parameters should be consistent with downstream impairments and may be modified at the discretion of the Board. Possible parameters include: Total Phosphorus, PCBs (Polychlorinated biphenyls), PFOS (Perfluorooctane sulfonate), Fecal Coliform, Turbidity, and Dissolved Oxygen. (Goal 5.3.1 A)

F. The WMO shall attempt to develop a water quality cost allocation formula for intercommunity projects by the year 2015. In the interim, the WMO will address each project individually. (Goal 5.3.1 B)

G. The WMO requires MnDOT, Ramsey County, Dakota County, and other governmental agencies to meet the water quality treatment requirements outlined in this plan for runoff leaving their right-of-way, facilities, or easements. Regular maintenance of their stormwater facilities shall also be performed. (Goal 5.3.1 B)

H. The WMO will recruit volunteers, through the use of its CAC, and encourage member cities to recruit volunteers to participate in the WMO's monitoring activities. Where necessary, volunteers would be provided training on MPCA-accepted protocol to ensure that the data is acceptable for the MCPA EQUIS Database. (Goal 5.3.1 A)

I. The WMO will use a similar water body classification system to that of the MPCA. **Table 5-1** will be used to help classify water bodies as deep lakes, shallow lakes, wetlands, and ponds. The pond column has been added to the MPCA's table by the WMO to provide a classification for water bodies that may be considered ponds.

The classification system determines whether a water body should be managed as a deep lake, shallow lake, wetland, or pond. For water bodies classified as wetlands, member cities must use a wetland management classification system that takes into account the susceptibility of the wetlands to degradation by stormwater. The WMO requires the member cities use a wetland classification system that ranks the wetlands and sets wetland management standards based on the rank and desired level of protection. (Goal 5.3.1 A, Goal 5.3.1 C)

Table 5-1: Factors Used to Classify Deep Lakes, Shallow Lakes, Wetlands, and Ponds

Factor	Deep Lakes	Shallow Lakes	Wetlands	Ponds
Public Waters Inventory Code	Typically coded as "L or LP" in PWI	May be coded as either "L, LP or LW" in PWI	Typically coded as "LW" in PWI	May be coded as either "L, LP or LW" in PWI
Depth, max.	Typically > 15 feet	Typically < 15 feet	Typically <7 feet	Typically <10 feet
Littoral area	Typically < 80%	Typically >80%	Typically 100%	Typically 100%

Factor	Deep Lakes	Shallow Lakes	Wetlands	Ponds
Area (min.)	> 10 acres (Bulletin 25)	> 10 acres (Bulletin 25)	No minimum	No minimum
Thermal stratification (summer)	Stratification common but dependent upon depth	Typically do not stratify	Typically do not stratify	Typically do not stratify
Fetch	Significant fetch depending on size & shape	Fetch is variable depending on size & shape	Rarely has a significant fetch	Rarely has a significant fetch
Substrate	Consolidated sand/silt/gravel	Consolidated to mucky	Mucky to unconsolidated	Variable
Shoreline features	Generally wave formed, often sand, gravel or rock	Generally wave formed, often sand, gravel or rock	Generally dominated by emergents	Generally dominated by emergents
Emergent vegetation & relative amount of open water	Shoreline may have ring of emergents; vast majority of basin open water	Emergents common, may cover much of fringe of lake; basin often has high percentage of open water	Emergents often dominate much of basin; often minimal open water	Emergents common, may cover much of fringe of pond; basin often has high percentage of open water
Submergent vegetation	Common in littoral fringe, extent dependant on transparency	Abundant in clear lakes; however may be lacking in algal-dominated turbid lakes	Common unless dominated by an emergent like cattail	Common unless dominated by an emergent like cattail
Dissolved Oxygen	Aerobic epilimnion; hypolimnion often anoxic by midsummer	Aerobic epilimnion but wide diurnal flux possible	Diurnal flux & anaerobic conditions common	Variable
Fishery	Typically managed for a sport/game fishery. May be stocked. DNR fishery assessments typically available	May or may not be managed for a sport fishery. If so, fishery assessment should be available. Winter aeration often used to minimize winterkill potential	Typically not managed for a sport fishery. Little or no DNR fishery information. Seldom aerated. May be managed to remove fish & promote waterfowl	Typically not managed for a sport fishery
Uses	Wide range of uses including boating, swimming, skiing, fishing; boat ramps & beaches common	Boating, fishing, waterfowl production, hunting, aesthetics; limited swimming; may have boat ramp, beaches uncommon	Waterfowl & wildlife production, hunting, aesthetics. Unimproved boat ramp if any. No beaches	Typically manmade basins. Important for flood protection and runoff pollutant removal. May provide passive recreational opportunities

Note: This table was developed by the MPCA and is located in the *Guidance Manual for Assessing the Quality of Minnesota Surface Waters.* The "Ponds" column was added by the WMO for the purposes of this Plan. It is important to note that the MPCA does not have a pond classification.

Table 5-2 shows the WMO's water quality goals based on classification.

Table 5-2: Water Quality Goals for Classified Water Bodies in the WMO

Classification	TP (ppb)	Chi-a (ppb)	Secchi (meters)
Deep Lakes	≤ 40	≤ 14	≥ 1.4
Shallow Lakes	≤ 60	≤ 20	≥ 1.0
Wetlands	NA	NA	NA
Ponds	NA	NA	NA

Note: The water quality goals shown in this table are consistent with the goals shown in the MPCA's *Guidance Manual for Assessing the Quality of Minnesota Surface Waters.*

5.3.3 WMO Policies

A. Member cities shall require a 50% total phosphorus removal from runoff leaving new development and redevelopment projects that exceed one acre of land disturbance (for this policy, mill and overlay and pavement rehabilitation projects are not considered land disturbance). For areas that discharge directly to the Mississippi River or to an impaired water body for which a TMDL has been completed, the findings of the TMDL will replace this requirement (whether more or less stringent). The required reduction of total phosphorus may be accomplished through the use of regional or on-site stormwater BMPs such as: ponds, NURP (National Urban Runoff Program) basins, infiltration basins, biofiltration, vegetated swales, mechanical devices, porous pavements, or any other techniques effective at phosphorus reduction. (Goal 5.3.1 C)

B. Linear construction projects should meet policy 5.3.3A where possible and feasible. Linear projects will be required to meet NPDES Construction Permit requirements. (Goal 5.3.1 C)

C. For stormwater discharge points/outfalls that did not exist prior to the adoption of this plan: member cities are to provide pretreatment of stormwater prior to its discharge to wetlands and other water resources. Pretreatment shall collect sediment, skim floatables, and be easily accessed for inspection and maintenance. (General Water Quality)

D. For replacement discharge points/outfalls or existing stormwater discharge points/outfalls: the WMO encourages member cities to provide pretreatment of stormwater prior to its discharge to wetlands and water resources. (General Water Quality)

5.4 Recreation, Fish and Wildlife Habitat

The WMO has many natural areas that are popular recreation sites and provide excellent fish and wildlife habitat. The following goals and policies have been developed to enhance water

based recreational opportunities and protect and improve fish and wildlife habitat. In addition, many of the other goals, strategies, and policies outlined throughout **Section 5** will result in improved recreational opportunities and fish and wildlife habitat.

5.4.1 WMO Goals

A. Protect and enhance fish and wildlife habitat and recreation opportunities, and maintain shoreland integrity.

5.4.2 WMO Strategies

A. The WMO will promote and encourage protection of non-disturbed natural shoreland areas and restoration of disturbed shorelines and streambanks to their natural state through participation in Blue Thumb or other educational programs. (Goal 5.4.1 A)

B. The WMO supports water quality improvements in order to maintain or improve water quality and the habitat consistent with intended use and classifications of lakes, streams, wetlands, and ponds. (Goal 5.4.1 A, Goal 5.5.1 A)

C. The WMO will encourage the appropriate development of access to water bodies for recreation and education. (Goal 5.4.1 A)

5.4.3 WMO Policies

A. The WMO requires member cities to consider landscape designs for projects located in close proximity to natural areas or greenways to:

1) increase beneficial habitat, wildlife and recreational uses; promote infiltration and vegetative water use; and

2) decrease detrimental wildlife uses (such as beaver dams, goose overabundance) that damage water control facilities, shoreline vegetation, water quality or recreational facilities. (Goal 5.4.1 A, Goal 5.5.1 A)

B. The WMO requires member cities to prioritize shoreland areas for restoration. Shoreland areas include streambanks and lakeshore areas. The cities will be required to address this issue in their local watershed management plans. (Goal 5.4.1 A)

C. Member cities are required to maintain a shoreland ordinance that is, at a minimum, in conformance with the requirements of the Minnesota DNR. (Goal 5.4.1 A)

D. The WMO requires member cities within the Mississippi River Critical Corridor Area/Mississippi National River Recreation Area (MRCCA/MNRRA) to conform to the current rules for areas within the MRCCA/MNRRA. (Goal 5.4.1 A)

5.5 Wetlands

There are many wetlands located throughout the WMO that provide wildlife habitat and offer a natural method of conveying and storing stormwater. The following goals and policies have been developed to manage existing wetlands and restore drained wetlands where possible.

5.5.1 WMO Goals

A. Enhance or protect wetlands from the adverse impacts of development and redevelopment.

5.5.2 WMO Strategies

A. The WMO will continue to support member city management efforts to improve wildlife habitat, aesthetic enjoyment, and other public uses of wetlands adjacent to parks. (Goal 5.5.1 A, Goal 5.4.1 A)

B. The WMO will continue in the support of wetlands for inclusion in Wetland Health Evaluation Program (WHEP).(Goal 5.5.1 A)

5.5.3 WMO Policies

A. Member cities are the local governmental units (LGUs) responsible for administering the Wetland Conservation Act (WCA). MnDOT is the LGU for the WCA on its rights-of-way. (Goal 5.5.1 A)

B. An average 15 foot buffer of natural vegetation above the 100-year High Water Level (if established) or wetted boundary is required by the WMO around lakes, streams, and wetlands, upon new or redevelopment projects that exceed one acre in land disturbance (for this policy, mill and overlay and pavement rehabilitation projects are not considered land disturbance). (Goal 5.5.1 A, Goal 5.4.1 A)

C. Member cities are to inventory, classify and determine the functions and values of wetlands, either through a comprehensive wetland management plan or for development or redevelopment projects that exceed one acre. For cities facing significant development or redevelopment, the WMO recommends that they complete comprehensive wetland management plans. The cities could complete the plans in phases, focusing on the areas where the information is most needed, such as areas within the 2030 MUSA. They should do this either as part of their local watershed planning process or as an implementation task identified in the local plan. Member cities shall submit their comprehensive wetland management plans to the WMO for review and comment. (Goal 5.5.1 A, Goal 5.4.1 A)

D. The WMO requires that member cities use a wetland classification system that ranks the wetlands and sets wetland management standards based on the rank and desired level of protection (e.g. highest to lowest protection). The wetland management standards should include buffer strip width, structural setback distance from buffer strip, amount of pretreatment required for phosphorus removal, storm bounce restrictions, and susceptibility of the wetlands to degradation by stormwater inputs. (Goal 5.5.1 A)

5.6 Groundwater Protection

The WMO recognizes the importance of groundwater on its drinking water sources and the overall hydrology of the area. The following goals and policies have been developed to protect groundwater quality and supply throughout the WMO.

5.6.1 WMO Goals

A. Protect groundwater resources within the WMO.

5.6.2 WMO Strategies

A. The WMO will work to improve the quality and availability of groundwater data. In addition, the WMO will coordinate with other agencies to identify sources or potential sources of groundwater pollution. (Goal 5.6.1 A)

B. The WMO will advocate for larger scale State monitoring and evaluation of LID (Low Impact Development) techniques on groundwater. (Goal 5.6.1 A)

C. The WMO will support the policies in the Dakota County and Ramsey County groundwater plans. (Goal 5.6.1 A)

5.6.3 WMO Policies

A. Member cities are to encourage groundwater recharge and are required to protect recharge areas from potential sources of contamination. The cities should also provide increased green space, native vegetation, and pond "dead" storage, wherever possible and appropriate, to allow for the infiltration of stormwater runoff and promote groundwater recharge. (Goal 5.6.1 A, Goal 5.2.1 A)

B. Member cities responsible for wellhead protection plans should follow the requirements outlined in those plans for managing groundwater within wellhead protection areas. (Goal 5.6.1 A)

C. The WMO encourages its member cities to use stormwater BMPs (such as grassed waterways, biofiltration, porous pavements, etc.) to maximize infiltration, where feasible and not detrimental to groundwater supplies. (Goal 5.6.1 A, Goal 5.2.1 A)

D. Each WMO member city is to maintain updated records of all known on-site septic systems, and prohibit installation of new individual sewer systems or alteration, repair or extension of existing systems when connection can be made to the city sanitary sewer system. The cities are to notify property owners with on-site septic systems that they are required to connect to the cities' sanitary sewer, if available. The cities are to also develop management programs and ordinances for subsurface sewage treatment systems (SSTS) that are consistent with MPCA standards and Minnesota Rules 7080 to 7083. (Goal 5.6.1 A)

E. Member cities should work with their counties in effort to promote awareness of groundwater resource issues through public education and information programs. (Goal 5.6.1 A, Goal 5.8.1 B)

F. Member cities are to support the policies in the Dakota County and Ramsey County groundwater plans.

5.7 Erosion and Sedimentation

Erosion and sedimentation causes surface water quality degradation, habitat damage, and other water resource issues. The following goals and policies have been developed to prevent and minimize sedimentation from areas prone to erosion.

5.7.1 WMO Goals

A. Minimize erosion, sedimentation, stream degradation, and related issues within the watershed.

5.7.2 WMO Strategies

A. The WMO shall address intercommunity erosion and sediment control issues. (Goal 5.7.1 A)

B. The WMO will facilitate joint certification training for member city staff on designing and inspecting erosion control plans and inspecting erosion control measures. (Goal 5.7.1 A, Goal 5.8.1 A)

C. The WMO will coordinate/conduct non-certification training for "other" city staff (streets, parks, building inspections) to address items in MS4 permit (e.g. mowing and erosion control). (Goal 5.7.1 A, Goal 5.8.1 A)

5.7.3 WMO Policies

A. Member cities must adopt, administer, implement and enforce ordinances addressing erosion and sediment control, including the permitting and inspection of such controls. The ordinance must be in conformance with the NPDES standards, at a minimum. The WMO suggests that the cities use the MPCA's model ordinance, which covers overall stormwater management. (Goal 5.7.1 A)

B. Member cities are to require erosion control plans for land development and construction work that will disturb one or more acres of land. Local watershed management plans and city ordinances are to include the requirements and procedures for reviewing, approving and enforcing the erosion control plans. Erosion Control Plans shall be prepared by a qualified individual, and shall conform to the MPCA's NPDES General Permit to Discharge Stormwater from Construction Sites. The erosion control plan shall also conform to all future NPDES stormwater regulations that apply to erosion control. (Goal 5.7.1 A)

C. Acceptable erosion in drainageways is limited to that which causes no net degradation of the watercourse or destruction of properties adjacent to the watercourse.

- Measures to alter the natural course and meandering of streams will be discouraged, except when foreseeable erosion threatens to damage structures, utilities or natural amenities, or impair the drainage system.

- Land use adjacent to watercourses shall be regulated to allow for the reasonably expected natural behavior of streams. (Goal 5.7.1 A)

D. Design of stream bank stabilization and streambed control measures should consider unique or special site conditions, energy dissipation potential, adverse effects, preservation of natural processes and habitat, and aesthetics, in addition to standard engineering and economic criteria. (Goal 5.7.1 A)

5.8 Public Participation and Education

The WMO desires to foster responsible water quality management practices by educating residents, business owners, member city staff, elected officials, and developers about proper water resource management. It is important for these audiences to recognize their role in responsible water resource management in their homes, businesses, and practices, to help preserve and improve the resources present within the WMO. The following goals and policies have been developed to increased public participation and provide improved awareness on water resource issues throughout the WMO.

5.8.1 WMO Goals

A. Expand the WMO's education and public involvement efforts to provide more assistance to the member cities.

B. Increase public awareness of human impacts on water quality and habitat and explore ways to increase active citizen involvement.

5.8.2 WMO Strategies

A. The WMO will develop and use email lists to communicate WMO activities, information, and announcements. (Goal 5.8.1 A, Goal 5.8.1 B)

B. The WMO will develop appropriate, targeted educational content regarding water resource issues to be used by member cities for distribution to and use by various citizen groups such as: homeowners and renters; youth groups; and community groups such as Rotary, Lions, Kiwanis, ROMA (Responsible Owners and Managers Organization), WSCO (West Side Citizens Organization), All Around the Neighborhood, Chamber of Commerce, etc. The WMO will also utilize water resource materials to educate the public at community events and festivals throughout the WMO. (Goal 5.8.1 A, Goal 5.8.1 B)

C. The WMO will maintain the WMO website to communicate watershed news, events, and other water resource information. WMO website address shall be included on all distributed material and will be updated regularly to serve as an additional source for watershed information(Goal 5.8.1 A, Goal 5.8.1 B)

D. The WMO shall seek citizen involvement to assist in the monitoring of water bodies or outlets (storm sewer or streams) to the Mississippi River. CAMP, WHEP, and CSMP are three programs that currently monitor water bodies in the WMO. The WMO shall solicit citizens (starting with the 3rd Generation Plan CAC) to either join these programs or start a new program for monitoring its water bodies. (Goal 5.8.1 B, Goal 5.3.1 A)

E. The WMO will continue to participate in the Blue Thumb Program or other similar programs. (Goal 5.8.1 B)

F. The WMO will continue to support Clean Water Minnesota Media Campaign or develop "catchy" educational information, possibly through the use of an ad agency, focusing on water quality within the community. The ad agency may provide varying media techniques depending on the audience being targeted. Educational components shall be updated to avoid redundancy. (Goal 5.8.1 A, Goal 5.8.1 B)

5.8.3 WMO Policies

A. Member cities' City Engineers and Public Works Officials are encouraged to attend Board Meetings to provide technical advice and information to the Board. (General Public Participation and Education)

B. Member cities are to make information available to active community groups such as Rotary, Lions, Kiwanis, ROMA (Responsible Owners and Managers Organization), WSCO (West Side Citizens Organization), All Around the Neighborhood, and Chamber of Commerce to educate and increase awareness of water resource issues throughout the WMO. (Goal 5.8.1 A, Goal 5.8.1 B)

5.9 Administration

The WMO's administration can have a significant impact on the success of the 3rd Generation Watershed Management Plan. The following goals and policies are aimed at operational activities associated with water resource management within the WMO.

5.9.1 WMO Goals

A. Meet the requirements set forth in the Metropolitan Surface Water Management Act regarding the management of a watershed management organization.

B. Increase efficiency of programs throughout the WMO and provide increased economic opportunities for the WMO and its member cities.

5.9.2 WMO Strategies

A. The WMO will explore opportunities to partner with other WMO/WD programs and County programs. The updates of neighboring WMO/WD plans may be an opportunity to explore these partnerships. (Goal 5.9.1 A, Goal 5.9.1 B)

B. The WMO will continue to publish an annual newsletter summarizing its activities for public distribution. (Goal 5.8.1 A, Goal 5.8.1 B)

C. The WMO will assist member cities (including being the applicant) in pursuing/securing grants for projects contained within an individual city and those that cross city boundaries. (Goal 5.9.1 A, Goal 5.9.1 B)

D. The WMO will adhere to BWSR administrative performance standards (e.g. data practices policy, project and program expenditures, Board training, operational guidelines, water quality and watershed yield trends, and public information and education outcomes). (Goal 5.9.1 A)

E. The WMO will utilize ad hoc subcommittees for special projects. (Goal 5.9.1 A, Goal 5.8.1 B)

F. The WMO will initiate the development of an eight to twelve member permanent CAC to serve as an ongoing advisory group. Citizens will be solicited as needed until the desired number is met. (Goal 5.9.1 A, Goal 5.8.1 B)

G. The WMO will continue to transition to an all citizen Board. (Goal 5.9.1 A, Goal 5.8.1 B)

H. The WMO will fund updating and maintenance of its web site (for posting data, the watershed management plan, etc.) through the WMO dues. (Goal 5.9.1 A)

I. The WMO will revise its joint powers agreement to reflect the 3rd Generation Watershed Management Plan. (Goal 5.9.1 A, Goal 5.3.1 C)

J. The WMO's cost allocation for intercommunity flooding and erosion control studies and construction projects will continue to be based on allowable flow. (Goal 5.9.1 A)

K. The WMO will provide technical review of projects, if requested, as a service to the member cities. Costs to complete these reviews may be charged back to member cities. (Goal 5.9.1 A)

L. The WMO will finance the implementation program elements through either the WMO dues (the annual contributions of its member cities) or some form of cost sharing in accordance with the joint powers agreement. The WMO and cities will also seek grants and other funding opportunities to help offset the costs of the implementation tasks. (Goal 5.9.1 A, Goal 5.9.1 B)

M. The operation and maintenance costs associated with a WMO improvement project will be apportioned according to the WMO joint powers agreement, as revised. (Goal 5.9.1 A)

N. Although the WMO will not be administering a permit program, the WMO will:

- Review projects for consistency with the WMO plan, as requested by member cities or other governmental agencies.

- Review and approve any proposed changes to the intercommunity stormwater system that are inconsistent with an approved local watershed management plan

- Review and approve any changes to the approved local plan that would cause the local plan to be inconsistent with the WMO plan.

- Review member city local plan updates for consistency with WMO Plan.

- Review annual progress reports from the member cities and provide areas that need to be addressed to keep in compliance with the WMO plan.

- Review member city comprehensive plan changes when revisions to their comprehensive plans affect water resource management. Stormwater management elements of the city comprehensive plans are to conform to the WMO plan. (Goal 5.9.1 A)

5.9.3 WMO Policies

A. Member cities are to adopt new ordinances or revise existing ordinances that meet the WMO policies listed in this plan. (Goal 5.9.1 A)

B. Member cities are to report their annual progress to the WMO. This may consist of each member city submitting an implementation plan progress update from their local water management plan. (Goal 5.9.1 A)

6.0 Implementation Program

Table 6-1, 6-2, and 6-3 contain a comprehensive list of the projects, programs, and studies that comprise the WMO implementation program. The WMO developed these activities through reviewing existing information (**Section 2**) and agency coordination (**Section 3**), identifying potential and existing problems (**Section 4**), developing goals, strategies, and policies (**Section 5**), and then assessing the need for programs, studies or projects. Each table shows estimated cost, proposed year of implementation, and proposed financing method for each element of the implementation program. The implementation program identifies special projects and ongoing implementation components through 2020. The proposed dates listed to complete the projects, programs, and studies are estimates and are highly dependent upon available funding. The implementation plan will be reviewed annually and updated as necessary based on past progress, new issues arising, and available funding.

Many of the activities listed in **Table 6-1, 6-2, and 6-3** are to be incorporated into each city's local watershed management plan and Capital Improvement Program. Capital improvements identified in the approved City local plans will be the responsibility of the local government units. The programs and studies identified in this section of the plan may be entirely or partially completed by the WMO, the local government unit, or joint effort between multiple entities.

Table 6-4 provides a cost summary of the implementation program. **Table 6-5** provides the estimated annual plan implementation cost for each member city. **Table 6-6** lists the projects and planning activities completed by the WMO.

TABLE 6-6

COMPLETED PLANNING AND PROJECTS

No.	Planning/Project	Description	Issue	Status
1	Project	Flooding on Akron Avenue between Mendota Road and Highway 110. Watershed includes Inver Grove Heights and West St. Paul.	Flooding	Drainage system improvements were completed in 1991.
2	Project	Flooding from East Lexington Avenue to Mayfield Heights Road near Highway 13. Watershed includes Mendota Heights and Lilydale.	Flooding	Drainage system improvements were completed in 1994 and 1996.
3	Planning	Watershed draining east along Highways 110 and 494. Watershed includes West St. Paul, Sunfish Lake, Inver Grove Heights, and South St. Paul.	Planning	Study was completed in 1989.
4	Planning	Hornbean Lake, Horseshoe Lake, and Sunfish Lake along Highway 494 in Sunfish Lake and Inver Grove Heights.	Planning	Study was incorporated into Sunfish Lake Water Resource Management Plan, approved 1991.
5	Planning	Seidls Lake Water Quality Study	Water Quality	Study was completed in 1991.
6	Project	Flooding and erosion along Ivy Falls Creek in Mendota Heights and West St. Paul (West of Delaware Avenue).	Flooding and Erosion	Three projects completed: 1) Ruby Drive Outfall (1990), 2) Ivy Falls Creek Stabilization (1994), 3) Thompson Avenue Drainage Diversion.
7	Planning	Water Quality Study for Simley Lake.	Water Quality	Study was completed in 1993 for the City of Inver Grove Heights.
8	Planning	Water Quality Monitoring Report for Horseshoe Lake, Hornbean Lake, and Sunfish Lake.	Water Quality	Monitoring report was completed in 1994 for the City of Sunfish Lake.
9	Project	Flooding and erosion in Simon's Ravine between Wentworth Avenue and Butler Avenue, from Robert Street to Concord Street.	Flooding and Erosion	West St. Paul pond expansions and storm sewer improvements completed 1993. Additional ponding constructed 1995. South St. Paul storm sewer improvements completed to Kaposia Dam (19th Avenue) with projects in 1990, 1993, 1994, 1999, and 2009.
10	Planning	Revise Joint Powers Agreement.	Administrative	Agreement completed in 2001, signatures completed in 2002
11	Project	Erosion, flooding, and safety at Simon's Ravine and Kaposia Dam in South St. Paul between Butler Avenue and Bromley Street.	Flooding, erosion, safety	System from Kaposia Dam to Concord completed in 2002, system from Concord to Mississippi River completed in 2006.
12	Project	Potential flooding on Babcock Trail south of Southview Boulevard. Watershed includes South St. Paul, Inver Grove Heights, and West St. Paul.	Potential Flooding	Drainage system improvements were completed in conjunction with Co. Road 14 improvements (2002).
13	Planning	Water Quality Modeling Study for Ivy Falls Creek, Interstate Valley Creek, and Highway 13 Subwatersheds	Water Quality	Modeling study was completed in 2003.

TABLE 6-6

COMPLETED PLANNING AND PROJECTS

No.	Planning/Project	Description	Issue	Status
14	Planning	Water Quality Feasibility Study for Ivy Falls Creek, Interstate Valley Creek, and Highway 13 Subwatersheds	Water Quality	Feasibility study was completed in 2004.
15	Planning	Seidls Pond/Lake lift station. Watershed includes South St. Paul, Inver Grove Heights, and West St. Paul.	Flooding/Drainage	Feasibility study completed in 2004.
16	Project	Diversion of Thompson Avenue drainage into Ivy Falls Creek subwatershed.	Flooding	Project was completed in 2006.
17	Planning	Flooding and erosion at Marie Avenue and Dodd Road. Watershed includes Inver Grove Heights, Sunfish Lake, Mendota Heights, and West St. Paul.	Flooding and Erosion	Feasibility Study Completed (2006).
18	Project	Bank Stabilization on Marie Creek in Mendota Heights north of Marie Avenue.	Erosion	Project was completed (2007,2008).
19	Planning	Allowable Flow Cost Apportionment for Dawn Way Storm Sewer Improvement Project. Watershed includes Inver Grove Heights and South St. Paul	Drainage	Hydrologic analysis and cost split analysis was completed in 2008.
20	Planning/Project	Water quality improvements for Anderson Pond in South St. Paul and Southview Pond in West St. Paul.	Flooding and Erosion	Feasibility Study was completed in 2005. Construction of improvements was completed in 2008-2009.
21	Planning	Create internet website.	Administrative	Worked with Dakota County SWCD to complete website in 2009.
22	Planning	Lexington Avenue-Trunk Highway 13 Drainage and Erosion Feasibility Study.	Flooding and Erosion	Feasibility Study was completed in 2010.

7.0 Impact on Local Governments

The WMO's intention is to limit additional requirements imposed upon local units of government. Most of the WMO plan's implementation program elements will be implemented by the member cities and many of the implementation tasks will be funded by WMO cost sharing. Some of the implementation program elements reflect the goals, policies and requirements of state and regional units of government that local units of government would need to address regardless. **Table 7-1** shows member city conformance with many of the policies contained in the 3rd Generation Watershed Management Plan.

Table 7-1: Member City Conformance with 3rd Generation WMO Policies

Policy	Inver Grove Heights	Lilydale	Mendota Heights	St. Paul	South St. Paul	Sunfish Lake	West St. Paul
Minimum Building Elevations (5.2.3 K)	Y	Y	Y	Y	Y	Y	Y
Rate Control (5.2.3 M)	Y	Y	Y	Y	Y	Y	Y
Storm Sewer Design (5.2.3 D-F)	Y	Y	Y	Y	Y	Y	Y
Runoff Control Plans (5.2.3 M)	N	Y	N	N	Y	N	N
50% Phosphorus Removal Policy (5.3.3 A)	N*	N*	N*	N*	N*	N*	N*
Pretreatment Prior to Infiltration (5.2.3 C)	N	N	N	N	N	N	N
Stormwater Easements (5.2.3 I)	Y	Y	Y	Y	Y	Y	Y
Erosion and Sediment Control (5.7.3 A-B)	Y	Y	Y	Y	Y	Y	Y
Wetland Buffer (5.5.3 B)	N (except in NW area)	N	N	N	N	Y	N
Shoreland Ordinance (5.4.3 D)	Y	N	Y	Y	Y	Y	Y
Prioritize shoreland areas for restoration (5.4.3 C)	N	N	N	N	N	N	N
Inventory and classify wetlands (5.5.3 C)	Y	N	Y	Y	Y	Y	Y

*Member city policy requires similar phosphorus removal as WMO policy 5.3.3 A. Member city policy should be amended to provide consistent language unless member city desires a more stringent policy.

7.1 WMO Responsibilities

The Lower Mississippi River Watershed Management Organization is not a permitting agency. As a result, the WMO's major responsibilities are to 1) ensure that the

policies and standards in the WMO plan are adopted and implemented by the member cities; 2) manage and assist member communities with intercommunity runoff, water quality, and water management issues; and 3) assess the performance of the WMO and the member cities toward achieving the goals stated in the WMO plan.

Member cities are responsible for primary management of stormwater and water resources within their boundaries. Member cities will continue as the local government units (LGUs) responsible for administering the Wetland Conservation Act within their boundaries, and will continue to implement and enforce their existing ordinances related to water resource management. The cities, other government organizations, and private parties are responsible for maintaining their stormwater systems.

7.2 Local Planning

According to MN Rules 8410.0160, the cities are to adopt local watershed management plans within two years of the BWSR's approval of the last watershed management organization plan that affects the unit of government.

It is anticipated that all of the member cities will need to revise their local plans to bring them into conformance with WMO's revised plan and MN Rules 8410. The following local units of government will be required to revise or prepare local plans that conform to the WMO plan, MN Statutes 103B and to MN Rules 8410:

<u>Dakota County:</u>
Inver Grove Heights
Lilydale
Mendota Heights
South St. Paul
Sunfish Lake
West St. Paul

<u>Ramsey County:</u>
St. Paul

Within 30 days of the WMO Board's adoption of the WMO plan, the WMO will notify each city of these requirements pertaining to local plan revision and adoption.

A local governmental unit can assume as much management control as it wishes through its approved local water management plan. The WMO assumes that the member cities will continue to be the permitting authority for all land alteration activities. To continue as the permitting authority, the local government must outline its permitting process in its local water management plan, including the preliminary and final platting process. The WMO may appeal the local government's approval of a project if the WMO believes the project is not consistent with the local plan.

The WMO will review proposed changes to an intercommunity stormwater system that are inconsistent with a city's approved plan, and/or changes to an approved city plan that would cause the plan to be inconsistent with the WMO plan.

7.2.1 Requirements for Local Watershed Management Plans

Local water management plans are required to conform to MS 103B.235, MN Rules 8410.0160, MN Rules 8410.0170 and the WMO plan. MN Rules 8410.0160 requires (in part) that:

> "Each local plan must include sections containing a table of contents; executive summary; land and water resource inventory; establishment of goals and policies; relation of goals and policies to local, regional, state, and federal plans, goals, and programs; assessment of problems; corrective actions; financial considerations; implementation priorities; amendment procedures; implementation program; and an appendix. Each community should consider including its local plan as a chapter of its local comprehensive plan."

MN Rules 8410.0170 explains in more detail the general requirements given above.

The policies and goals established in each city's watershed management plan must be consistent with the WMO plan. The section of the local plan covering assessment of problems must include those problems identified in the WMO plan that affect the city. The approaches for improvement proposed must be limited to those actions that can be carried out at the local government level and must be consistent with the WMO plan. A city may use all or part of the WMO plan when developing its local plan.

Local watershed management plans must clearly identify when the management programs will go into effect. All local plan controls and programs must be developed and in effect within two years of adoption of the last WMO plan in the local governmental unit.

7.2.2 Lower Mississippi River WMO Review of Local Watershed Management Plans

Before a member city adopts its local watershed management plan, the plan must be submitted to all of the affected WMOs for review. The city must also submit its plan to the Metropolitan Council, and to any counties with adopted groundwater plans, for a 45-day review. Within 60 days of receipt of the local plan, the WMO will review the local plan for conformance with the WMO plan. As part of its review, the WMO will take into consideration any comments received from the Metropolitan Council and the counties. The WMO will approve or disapprove all or part of the local plan within the 60-day time frame, unless the city agrees to an extension. If the WMO does not complete its review, or fails to approve/disapprove the plan within the allotted time, and the city has not given an extension, the local plan will be considered approved (MN Rules 8410.0170, Subp. 12 and MN Statutes 103B.235, Subd. 3 and 3a).

Once the WMO approves the local plan, the local government must adopt and implement its plan within 120 days and amend its official controls within 180 days of plan approval. Each member city must notify the WMO (and the other affected WMOs) within 30 days of plan adoption and implementation, and adoption of necessary official controls.

Any amendments to the local plan must be submitted to the WMO for review and approval prior to their adoption by the member city. The WMO review process is the same as for the original local plan.

7.3 Review of WMO Plan

This watershed management plan was submitted to the member cities, the Board of Water and Soil Resources, the Minnesota Pollution Control Agency, the Minnesota Department of Natural Resources, the Minnesota Department of Agriculture, the Minnesota Department of Health, the Minnesota Department of Transportation, the Metropolitan Council, the counties, the Dakota Soil and Water Conservation District, the Ramsey Soil and Water Conservation District, the National Park Service, and Friends of the Mississippi River for formal review, in accordance with Minnesota statutes.

8.0 Plan Revision and Amendments

8.1 Plan Revision and Amendments

This plan remains in effect for ten (10) years from the year it was approved and adopted, unless it is superseded by adoption and approval of a succeeding plan. All amendments to this plan must follow the procedures set forth in this section, or as required by revised laws and rules. Plan amendments may be proposed by any person to the LMRWMO Board, but only the LMRWMO may initiate the amendment process. The LMRWMO may amend its plan in the interim (interim plan amendment) if either minor changes are required or if problems arise that are not addressed in the plan.

In accordance with Minnesota Statutes 103B.231, Subd. 3a, BWSR developed (and occasionally revises) a priority schedule for the revision of water management plans. BWSR uses the schedule to inform WMOs of when they will be required to revise their plans. Minnesota Statutes 103B.231, Subd. 3a also states that once a WMO is notified by BWSR that a plan revision is required, the WMO has 24 months from the date of notification to submit a revised plan for review. If BWSR does not notify the LMRWMO that a plan revision is required and the plan expires, Minnesota Statutes 103B.231, Subd. 3a states that the existing plan, authorities, and official controls of the LMRWMO remain in full force and effect until a revision is approved. The same statute also allows the LMRWMO to submit a draft plan revision for review prior to BWSR's scheduled date. If BWSR fails to begin review of the submitted plan within 45 days of plan submittal, the LMRWMO may adopt and implement the plan without formal BWSR approval.

8.2 General Amendment Procedure

Minnesota Rules 8410.0140, Subp. 2, requires that all plan amendments must adhere to the review process listed in MN Statutes 103B.231, Subd. 11, except when the proposed amendments constitute minor amendments and:

1. The LMRWMO held a public meeting to explain the amendments and published a legal notice of the meeting twice, at least seven days and fourteen days before the date of the meeting;

2. The LMRWMO sent copies of the amendments to the affected local units of government, the Metropolitan Council, and the state review agencies for review and comment; and

3. BWSR either agreed that the amendments are minor or failed to act within 45 days of receipt of the amendments.

The review process for minor plan amendments is more streamlined than the general plan amendment review process. The LMRWMO will also consider sending drafts of proposed amendments to all plan review authorities to receive input before establishing a hearing date or beginning the formal review process.

8.3 Minor Plan Amendments

MN Rules 8410.0140, Subp.3 considers amendments to the approved capital improvement program to be minor plan amendments if the following conditions are met:

1. The original plan set forth the capital improvements but not to the degree needed to meet the definition of "capital improvement program" as provided in Minnesota Statutes, section 103B.205, subdivision 3; and

2. The affected county or counties approve the capital improvement in its revised, more detailed form.

The following examples of other minor plan amendments are given in Minnesota Rules 8410.0020, Subp. 10:

> "...recodification of the plan, revision of a procedure meant to streamline administration of the plan, clarification of the intent of a policy, the inclusion of additional data not requiring interpretation, or any other action that will not adversely affect a local unit of government or diminish a water management organization's ability to achieve its plan's goals or implementation program."

Prior to sending a proposed minor plan amendment out for review, the LMRWMO Board will obtain BWSR's concurrence that the proposed amendment is a minor plan amendment.

8.4 Amendment Format

Upon completion of the plan amendment, the LMRWMO will submit the plan amendment to the appropriate review authorities in a format consistent with Minnesota Rules 8410.0140, Subp. 4. The rule requires that, unless the entire document is reprinted, all amendments adopted must be printed in the form of replacement pages for the plan, each page of which must:

1. Show deleted text as stricken and new text as underlined (for draft amendments under consideration):

2. Be renumbered as appropriate; and

3. Include the effective date of the amendment.

8.5 Distribution of Amendments

The LMRWMO will maintain a distribution list of everyone who receives a copy of the plan. Within 30 days of adopting an amendment, the LMRWMO will distribute copies of the amendment to everyone on the distribution list. The LMRWMO will also consider sending drafts of proposed amendments to all plan review authorities to receive input before establishing a hearing date or beginning the formal review process.

9.0 References

Portions of the *Lower Mississippi River Watershed Management Organization Watershed Management Plan, 2001 (Barr Engineering)* were unchanged and reused in this document. Note: The Depth to Groundwater shown on this map is an interpolation. A groundwater elevation raster was created using known lake, wetland, and soil boring information. The depth to groundwater was then calculated by subtracting the groundwater elevations from ground elevations throughout the WMO. Groundwater elevations were then verified using well information from the county well index and water table elevations from the Dakota and Ramsey County Geologic Atlases. For exact groundwater information it is suggested that soil borings be performed at the desired location.

APPENDIX B

JOINT POWERS AGREEMENT

REVISED AND RESTATED

JOINT POWERS AGREEMENT ESTABLISHING A WATERSHED MANAGEMENT ORGANIZATION FOR THE LOWER MISSISSIPPI RIVER WATERSHED

THE PARTIES TO THIS AGREEMENT ("Agreement") are Members of the Lower Mississippi River Watershed Management Organization and have land that drain surface water into the Mississippi River. This Agreement amends and restates the original Joint Powers Agreement between the Members which became effective in 1985 and includes all prior Amendments to the 1985 Joint Powers Agreement. This Agreement is made pursuant to the authority conferred upon the parties by Minn. Stat. §§ 471.59 and 103B.201 - 103B.252.

SECTION 1. NAME AND LEGAL BOUNDARY. The parties hereby establish the Lower Mississippi River Watershed Management Organization, hereinafter referred to as the "WMO." The "Legal Boundary Map of the Lower Mississippi River Watershed Management Organization" is attached hereto as Exhibit A.

SECTION 2. PURPOSE. The purpose of this Agreement is to provide an organization to regulate the natural water storage and retention of the Lower Mississippi watershed to:

A. Protect, preserve, and use natural surface and ground water storage and retention systems;

B. Minimize public capital expenditures needed to correct flooding and water quality problems;

C. Identify and plan for means to effectively protect and improve surface and ground water quality;

D. Establish more uniform local policies and official controls for surface and ground water management;

E. Prevent erosion of soil into surface water systems;

F. Promote ground water recharge;

G. Protect and enhance fish and wildlife habitat and water recreational facilities;

H. Secure the other benefits associated with the proper management of surface and ground water; and

I. Carry out all the duties and responsibilities in Minn. Stat. §§ 471.59 and 103B.201 - 103B.252.

SECTION 3. DEFINITIONS.

Subdivision 1. *"Allowable Flow"* means the rate and volume of flow, according the to design criteria set forth in the Watershed Management Plan, at which a Member community may discharge into the drainage system without financial obligation and as the rate and volume of surface water runoff from a tributary area under natural conditions, with a drainage system in place which has been designed and constructed according to the criteria stated herein, excluding diverted waters. Current topographic data that exists on the enactment date of this Agreement shall be used for the determination of the natural conditions and calculation of the allowable flow.

Subdivision 2. *"Board"* means the board of managers of the WMO.

Subdivision 3. *"Council"* means the governing body of a governmental unit which is a Member of this WMO.

Subdivision 4. *"Drainage Facilities"* means any improvement constructed for the conveyance or storage of surface water.

Subdivision 5. *"Drainage System"* means the combination of drainage facilities required to safely control or convey runoff water from a major tributary drainage area(s) to a point of final discharge into a water body.

Subdivision 6. *"Excessive Flow"* means that rate and volume of flow, calculated according to the design criteria in the Watershed Management Plan, from a Member which is in excess of the allowable flow of that Member.

Subdivision 7. *"Governmental Unit"* means any city.

Subdivision 8. *"Lower Mississippi River Watershed"* or *"Watershed"* means the area contained within the "Legal Boundary Map of the Lower Mississippi River Water Management Organization" attached hereto as Exhibit "A".

Subdivision 9. *"Manager"* means the representative appointed to the Board by a Member.

Subdivision 10. *"Member"* means a governmental unit which enters into this Agreement.

Subdivision 11. *"Natural Conditions"* means the characteristics of the land on the date of enactment without regard to any urban development including structures, parking lots, or other artificial improvements.

Subdivision 12. *"Rate of Flow"* means the discharge of surface water runoff as a function of time which has been calculated according to the design criteria identified in the Watershed Management Plan. The rate of flow shall apply to the design and construction of open channels and storm sewer conduits.

Subdivision 13. *"Volume of Flow"* means the total discharge of all surface water runoff which has been calculated according to the design criteria identified in the Watershed Management Plan. The volume of runoff flow shall apply to the design and construction of detention facilities.

Subdivision 14. *"Watershed Management Organization"* or *"WMO"* means the organization created by this Agreement the full name of which is "Lower Mississippi River Watershed Management Organization." It shall be a public agency of its Members.

SECTION 4. MEMBERSHIP. The Membership of the WMO shall consist of the following governmental units, each entitled to the following eligible votes:

Member	Votes
City of Inver Grove Heights	3 votes
City of Lilydale	1 vote
City of Mendota Heights	2 votes
City of Saint Paul	2 votes
City of South Saint Paul	2 votes
City of Sunfish Lake	1 vote
City of West Saint Paul	2 votes

No change in governmental boundaries, structure, organizational status, or character shall affect the eligibility of any governmental unit listed above to be represented on the WMO, so long as such governmental unit continues to exist as a separate political subdivision. A majority of all eligible votes shall be sufficient for all matters, unless otherwise provided for in this Agreement. A majority vote of all Members, with each Member having one vote, shall be required for Section 7. A Member may not cast a split vote. Any Member that fails to contribute their share of the WMO annual administration fund or their allocation of a capital improvement cost, shall be declared ineligible for voting on all matters before the Board, until such contribution is made to the WMO.

SECTION 5. ADVISORY COMMITTEES.

Subdivision 1. Technical Advisory Committee. The following governmental subdivisions or agencies shall be requested to appoint a non-voting advisory Member to the WMO: Dakota County, Ramsey County, Dakota County Soil and Water Conservation District. The advisory Members shall not be required to contribute funds for the operation

of the WMO, except as provided in Minn. Stat. § 103B.251, but may provide technical services.

Subdivision 2. Citizen Advisory Committee. The WMO may establish a citizen advisory committee ("CAC") from the public at large to provide input on Watershed Management Plan revisions and other matters as deemed appropriate. The CAC shall be appointed by the WMO considering individuals nominated by each Member. The WMO will notify each Member of its intent to establish a CAC, will specify the purpose and duration of the CAC, and will request each Member to nominate candidates to be considered for appointment by the WMO. At the time of establishment of a CAC, the WMO will appoint a chair of the CAC, a board member liaison to the CAC, establish a time for submittal of any comments, and specify the support the WMO will provide to the CAC.

SECTION 6. BOARD OF MANAGERS.

Subdivision 1. Appointment. The governing body of the WMO shall be its Board. Each Member shall be entitled to appoint one Manager and an alternate on the Board. The alternate shall have the right to vote in the absence of their representative. Vacancies in the office of Manager shall be filled for the remainder of the term by the Member which appointed or had the right to appoint the Manager. All vacancies shall be filled within ninety (90) days after they occur.

Subdivision 2. Eligibility or Qualification. The Council of each Member shall determine the eligibility or qualification of its representative on the WMO.

Subdivision 3. Term. The Managers shall not have a fixed term, but shall serve at the pleasure of the Member appointing such Manager to the Board.

Subdivision 4. Removal. A Manager may not be removed from the Board prior to the expiration of his or her term, unless the Manager consents in writing or unless removed in accordance with the procedures provided under Minnesota Rules 8410.0040.

Subdivision 5. Compensation. Managers shall serve without compensation from the WMO, but this shall not prevent a Member from providing compensation for its Manager.

Subdivision 6. Organizational Meeting. At the first meeting of the Board each year, the Board shall elect from its Managers a chair, a vice chair, a secretary/treasurer, and such other officers as it deems necessary to conduct its meetings and affairs. The Board shall adopt rules of order and procedure governing its meetings and affairs. The rules of order and procedure may be amended from time to time at either a regular or a special meeting of the Board provided that at least ten (10) days' prior notice of the proposed amendment has been furnished to each person to whom notice of the Board meetings is required to be sent. A majority vote of all eligible votes of the Members of the WMO shall be sufficient to adopt any proposed amendment to such rules of order and procedure.

Subdivision 7. Annual Meeting Requirement. The Board shall meet at least annually, at times and places selected by the Board. If the Board changes its regularly established meeting place or time, it shall place a notice of the change on a bulletin board at least three (3) days in advance in the building where it was scheduled to meet.

Subdivision 8. Committees. The Board may establish committees as it deems appropriate.

Subdivision 9. Quorum. The Board shall not take any action without a quorum present. A quorum shall be at least four Members.

SECTION 7. POWERS AND DUTIES OF THE WMO. The WMO, acting by its Board:

Subdivision 1. Shall prepare, adopt and implement a Watershed Management Plan meeting the requirements of Minn. Stat. § 103B.231;

Subdivision 2. Shall review and approve local water management plans as provided in Minn. Stat. § 103B.235;

Subdivision 3. Shall exercise the authority of a watershed district under Minn. Stat. Chapter 103D to regulate the use and development of land in the watershed when one or more of the following conditions exist:

A. The local government unit exercising planning and zoning authority over the land under Minn. Stat. §§ 366.10 to 366.19, 394.21 to 394.37, or 462.351 to 462.364 does not have a local water management plan approved and adopted in accordance with requirements of Minn. Stat. § 103B.235 or has not adopted the implementation program described in the plan.

B. An application to the local government unit for a permit for the use and development of land, requires an amendment to, or variance from, the adopted local water management plan or implementation program of the local unit.

C. The local government unit has authorized the WMO to require permits for the use and development of land.

Subdivision 4. Shall adopt an annual work plan.

Subdivision 5. May employ such persons as it deems necessary to accomplish its duties and powers.

Subdivision 6. May contract for space and for material and supplies to carry on its activities either with a Member or elsewhere.

Subdivision 7. May acquire necessary personal and real property to carry out its powers and its duties.

Subdivision 8. May make necessary surveys or use other reliable surveys and data, and develop projects to accomplish the purposes for which the WMO is organized.

Subdivision 9. May cooperate or contract with the State of Minnesota or any subdivision thereof or federal agency or private or public organization to accomplish the purposes for which it is organized.

Subdivision 10. May order any governmental unit to carry out the local water management plan which has been approved by the Board. If the local unit of government fails to do so, in addition to other remedies, in its discretion, the Board may implement any required action or improvement in accordance with this Agreement.

Subdivision 11. May acquire, operate, construct, and maintain the capital improvements delineated in the Watershed Management Plan adopted by the Board.

Subdivision 12. May contract for or purchase such insurance as the Board deems necessary for the protection of the WMO and its Board.

Subdivision 13. May establish and maintain devices for acquiring and recording hydrological and water quality data within the watershed area of the WMO.

Subdivision 14. May enter upon lands within or without the watershed to make surveys and investigations to accomplish the purposes of the WMO.

Subdivision 15. May provide any Member with technical data or any other information of which the WMO has knowledge which will assist the Member in preparing land use classifications or local water management plans within the watershed.

Subdivision 16. May provide legal and technical assistance in connection with litigation or other proceedings between one or more of its Members and any other political subdivision, commission, board, corporation, individual, or agency relating to the

planning or construction of facilities to drain or pond storm waters or relating to water quality within the WMO.

Subdivision 17. May accumulate reserve funds for the purposes herein mentioned and may invest funds of the WMO not currently needed for its operations.

Subdivision 18. May collect money, in accordance with the provisions of this Agreement, from its Members and from any other source approved by the Board.

Subdivision 19. May make contracts, incur expenses, and make expenditures necessary and incidental to the effectuation of its purposes and powers.

Subdivision 20. Shall cause to be made an annual audit of the books and accounts of the WMO and shall make and file a report to its Members at least once each year including the following information:

A. The financial condition of the WMO;

B. The status of all WMO projects and work within the watershed; and

C. The business transacted by the WMO and other matters which affect the interests of the WMO. Copies of the report shall be transmitted to the clerk of each Member by March 31 of each year.

Subdivision 21. Shall make the WMO's books, reports, and records available for and open to inspection by its Members or the public at all reasonable times.

Subdivision 22. May recommend changes in this Agreement to its Members. Any amendments shall require ratification by all the parties to this Agreement.

Subdivision 23. May exercise all other powers necessary and incidental to the implementation of the purposes and powers set forth herein and as authorized by Minn. Stat. §§ 103B.201 through 103B.252.

Subdivision 24. Must solicit proposals for all legal, engineering, auditing, and other technical services in accordance with Minnesota Statutes § 103B.227, subd. 5.

Subdivision 25. Shall coordinate its planning activities with contiguous watershed management organizations and counties conducting water planning and implementation under Minn. Stat. Chapter 103B.

Subdivision 26. Shall designate one or more legal newspapers of general circulation which are published in the county(ies) in which the watershed is located.

SECTION 8. POWERS AND DUTIES OF THE OFFICERS OF THE BOARD.

Subdivision 1. It shall be the duty of the Chair of the Board to:

A. Attend and preside at all meetings of the Board;

B. Assist in the preparation of meeting agendas and the annual work plan;

C. See that orders and resolutions of the Board are carried into effect;

D. Sign and execute documents as may be required for the Board's exercise of its powers, except as otherwise required by law; and

E. Perform such other duties applicable to the office as are necessary to fulfill the powers and duties of the Board as set forth in this Agreement, and as provided by law.

Subdivision 2. It shall be the duty of the Vice Chair of the Board to:

A. Perform the duties of the Chair in the Chair's absence; and

B. Perform other duties as assigned from time to time by the Board.

Subdivision 3. It shall be the duty of the Secretary/Treasurer of the Board to:

A. Keep and post a true and accurate record of the proceedings of all meetings of the Board;

B. Keep a record of all amendments, alterations and additions to this Agreement;

C. Prepare and process all correspondence;

D. Prepare and file all reports and statements as required by law and this Agreement;

E. Keep all financial accounts of the WMO, and prepare and present to the Board full and detailed financial statements of the WMO prior to its annual meeting; and

F. Perform other duties as assigned from time to time by the Board.

SECTION 9. CONSTRUCTION OF IMPROVEMENTS.

Subdivision 1. All construction, reconstruction, extension or maintenance of WMO improvements, including outlets, lift stations, dams, reservoirs, or appurtenances of a surface water or storm sewer system ordered by the WMO which involve potential construction by or assessment against any Member or against privately or publicly owned land within the watershed shall adhere to the following procedures set forth in this section. The Board shall secure from its engineers or some other competent person a preliminary report advising it whether the proposed improvement is feasible, whether there are feasible alternatives, whether the proposed improvement shall best be made as proposed or in conjunction with some other improvement, a determination of the quantity and/or quality of storm and surface water contributed to the improvement by each Member, the estimated cost of the improvement(s), including maintenance, the estimated cost to each Member, and evaluating the consistency of the improvement with the Watershed Management Plan capital improvement section. The Board shall then hold a public hearing on the proposed improvement. Notice of the hearing shall be mailed to the clerk of each affected Member and shall also be published in the Board's official newspaper(s). The notice shall be mailed not less than forty-five (45) days before the hearing, shall state the time and place of the hearing, the general nature of the improvement, the estimated total cost, and the estimated cost to each Member.

To order the improvement, a resolution setting forth the order shall require a favorable majority vote of all eligible votes of the Members of the WMO. The order shall

describe the improvement, shall allocate in percentages the cost allocation among the Members, shall determine the method of financing, shall designate the engineers to prepare plans and specifications, and shall designate the entity that will contract for the improvement. The Board shall not order and no engineer shall prepare plans and specification before the Board has adopted a resolution ordering the improvement. After the Board has ordered an improvement, it shall forward the preliminary report to all affected Members with an estimated time schedule for the construction of the improvement.

The Board shall allow not less than 90 days, nor more than 270 days, for each Member to conduct hearings as provided by law or applicable charter requirements, to approve the construction and the method of financing of the improvement which the Member will use to pay its proportionate share of the costs of the improvement.

If the WMO proposes to use Dakota County's and/or Ramsey County's bonding authority, or if the WMO proposes to certify all or any part of an improvement to Dakota and/or Ramsey County for payment, then and in that event all proceedings shall be carried out in accordance with Minn. Stat. § 103B.251.

The Board may order advertising for bids upon receipt of notice from each Member which will be assessed that it has completed its hearing or determined its method of payment, or upon expiration of 270 days after the mailing of the preliminary report to the Members, whichever occurs first.

Subdivision 2. Any Member aggrieved by the determination of the Board as to the financing of an improvement or allocation of the costs of an improvement shall have thirty (30) days after the WMO resolution ordering the improvement to appeal the determination to arbitration. The appeal shall be in writing requesting the arbitration and

shall be addressed to the Board in c/o City of South St. Paul, 125 3rd Ave. N., South St. Paul, MN 55075. The determination of the Member's appeal shall be referred to a Board of Arbitration. The Board of Arbitration shall consist of three (3) persons: one to be appointed by the Board, one to be appointed by the appealing Member, and the third to be appointed by the two so selected. In the event the two persons so selected do not appoint the third person within fifteen (15) days after their appointment, then the chief judge of the District Court of Dakota County shall have jurisdiction to appoint, upon application of either or both of the two earlier selected, the third person to the Board of Arbitration. The third person selected shall not be a resident of any Member and if appointed by the chief judge, shall be a person knowledgeable in the subject matter of the dispute. The arbitrators' expenses and fees, together with the other expenses, not including counsel fees, incurred in the conduct of the arbitration shall be divided equally between the WMO and the appealing Member. Arbitration shall be conducted in accordance with the Uniform Arbitration Act, Minn. Stat. Chapter 572. Arbitration must be completed within the 270 day period provided for in Subdivision 1 of this Section.

Subdivision 3. Contracts for Improvements. The bidding and contracting of the work may be let by any Member or by the WMO as determined by the Board, in compliance with state statutes. Contracts and bidding procedures shall comply with all legal requirements.

Subdivision 4. Supervision. All improvement contracts shall be supervised by the entity awarding the contract. A WMO representative shall also be authorized to observe and review the work in progress and the Members agree to cooperate with the WMO representative in accomplishing the WMO's purposes. Representatives of the WMO shall have the right to enter upon the place or places where the improvement work is in

progress for the purpose of making reasonable tests and inspections. The WMO representative shall report to the Board on the progress of the work.

Subdivision 5. Land Acquisition. The WMO shall not have the power of eminent domain. All easements or interest in land which are necessary for an improvement will be negotiated or condemned in accordance with Minn. Stat. Chapter 117 by the Member where the land is located, and each Member agrees to acquire the necessary easement or right-of-way or partial or complete interest in land upon order of the Board to accomplish the purposes of this Agreement. All reasonable costs of the acquisition, including attorney's and appraiser's fees, shall be a cost of the improvement, and shall be allocated according to the formula for allocating Capital Improvement cost in Section 10, Subdivision 7. If a Member determines it is in its best interests to acquire additional rights in lands for some other purposes, in conjunction with the taking of lands for the improvement, the costs of the acquisition of additional rights in lands will not be included in the improvement costs. The Board, in determining the amount of the improvement costs to be assessed to each Member, may take into consideration the land use for which the additional lands are being acquired and may credit the acquiring Member for the land acquisition to the extent that it benefits the other Members. Any credits may be applied to the cost allocation of the improvement, or the Board, if feasible and necessary, may defer the credits to a future improvement.

Members may not condemn or negotiate for land acquisition to pond or drain storm and surface waters within the corporate boundaries of another Member within the WMO.

SECTION 10. FINANCES.

Subdivision 1. Disbursements. The WMO funds may be expended by the Board in accordance with this Agreement in a manner determined by the Board. The Board shall designate one or more national or state bank or trust companies authorized to receive deposits of public monies to act as depositories for the WMO funds. In no event shall there be a disbursement of WMO funds without approval by the Board and the signature of at least two (2) Board Members, one of whom shall be an officer. The Board may require the secretary/treasurer to file with the Board a bond in the sum of at least $10,000 or such higher amount as shall be determined by the Board. The WMO shall pay the premium on said bond.

Subdivision 2. Budget. On or before July 1 of each year, the Board shall adopt a general fund budget ("Budget") by a majority vote of all Members (with each Member having one vote) for the ensuing year and decide upon the total amount necessary for the general fund. The secretary/treasurer of the Board shall certify the Budget to the clerk of each Member, together with a statement of the proportion of the Budget to be provided by each Member, computed in accordance with Section 10, Subdivision 5. The council of each Member shall review the Budget, and the Board shall upon notice from any Member received prior to August 1, hear objections to the Budget, and may, upon notice to all Members of the time, date, place of and right to participate in the hearing and after a hearing, modify or amend the Budget, and then give notice to the Members of any and all modifications or amendments. Each Member agrees to provide the funds required by the Budget by February 15th of each year.

If a Member fails to provide its share of the funds required by the Budget by February 15 of each year, the unpaid balance of the funds shall accrue interest at a rate of

eight percent (8%) per annum commencing the day following February 15th of the year in which the funds were due. The WMO may take whatever action, at law or in equity it deems appropriate, to collect any amounts due from a Member under this Agreement. The Member agrees to pay the cost of collection, including reasonable attorneys' fees.

Subdivision 3. Maintenance. The Board shall have the option of funding maintenance work through the Budget, or funding as a capital improvement in accordance with Subdivision 6 of this Section. Maintenance costs that are associated with an improvement in the approved Capital Improvement Program, shall be allocated according to the same formula as is applicable for allocating capital improvement costs as identified in Section 10, Subdivision 7. The Members affected by the improvement shall decide on the level of maintenance to be applied to the improvement. If the Members cannot agree, the Board shall make the determination.

Subdivision 4. Tax Levy. If authorized by law, the WMO may levy a tax. The proceeds of any tax levied under this subdivision shall be expended only for the purposes authorized by law. The WMO may accumulate the proceeds of levies as an alternative to issuing bonds to finance improvements.

Subdivision 5. General Fund. Each Member agrees to contribute each year to a general fund to be used for general administration purposes including, but not limited to: improvement projects, salaries, rent, supplies, development of an overall plan, insurance, bonds, and to purchase and maintain devices to measure hydrological and water quality data. The funds may also be used for any other purpose authorized by this Agreement. The annual contribution by each Member shall be based fifty percent (50%) on taxable market value (for the preceding year) and fifty percent (50%) on area in accordance with the following formula:

Annual Watershed Levy = L

Taxable Market Value of a
Member's Property in the Watershed = MV

Taxable Market Value of All Property in the Watershed = TV

Acres of Property a Member Has in the Watershed = A

Total Acres in Watershed = TA

Member Required Contribution = C

$$\frac{1}{2}L \times \frac{MV}{TV} + \frac{1}{2}L \times \frac{A}{TA} = C$$

Subdivision 6. Capital Improvement.

A. All capital improvements ordered by the Board must be included in the WMO's adopted capital improvement program. An improvement fund shall be established for each improvement ordered by the WMO. If ordered by the Board, each Member agrees to contribute to the funds its proportionate share of the engineering, legal, and administrative costs as determined by the amount to be assessed against each Member as a cost of the improvement. The Board shall submit in writing a statement to each Member, setting forth in detail the expenses incurred by the WMO for each improvement.

Each Member further agrees to pay its proportionate share of the cost of the improvement in accordance with the determination of the Board, under Section 10, Subdivision 7. The Board or the Member awarding the contract shall submit in writing copies of the engineer's certificate authorizing payment during construction and the Member being billed agrees to pay its share of the costs within thirty (30) days after receipt of the statement. The Board may also require payment from Members before awarding a contract based upon an engineer's estimate of cost. Billings will then be adjusted when actual costs are known. The Board or the Member awarding the contract shall advise other contributing Members of the tentative time schedule of the work and the estimated times when the contributions shall be necessary.

B. Notwithstanding the provisions of paragraph (A) of this Subdivision, the WMO may also fund all or any part of the cost of a capital improvement contained in the capital improvement program of the plan in accordance with Minn. Stat. § 103B.251. The WMO and Dakota County and/or Ramsey County may establish a maintenance fund to be used for normal and routine maintenance of an improvement constructed in whole or in part with money provided by Dakota and/or Ramsey County pursuant to Minn. Stat. § 103B.251. The levy and collection of an ad valorem tax levy for maintenance shall be by Dakota and/or Ramsey County based upon a tax levy resolution adopted by the WMO and remitted to the

county(ies) on or before October 1 of each year. If it is determined to levy for maintenance, the WMO shall be required to follow the hearing process established by Minn. Stat. §103D.921. Mailed notice shall also be sent to the clerk of each Member at least thirty (30) days prior to the hearing.

C. The WMO may also fund all or any part of the cost of a capital improvement contained in the capital improvement program of the plan in accordance with Minn. Stat. § 103B.241.

Subdivision 7. Capital Cost Allocation of Improvements in the Board's Watershed Management Plan. All capital improvement costs of improvements designated in the WMO's adopted Watershed Management Plan for construction by the WMO pursuant to Section 10, Subdivision 6A of this Agreement shall be apportioned by the following methods or a combination of these methods:

A. For improvements related to water quality:

1. For water quality monitoring, water quality trend analyses, water quality modeling, and water quality studies, the cost sharing will be proportional to the tributary watershed area.

2. For water quality projects and maintenance, the cost sharing will be based on Allowable Flow, tributary area, and/or relative phosphorus loading.

3. The cost sharing for WMO operation of a future Watershed Outlet Monitoring Program station, or other program that monitors the quality of the stormwater runoff that discharges into the Mississippi River from the WMO, will be proportional to the tributary watershed area.

4. Or other cost sharing method approved by the Board.

5. Pursuant to Minn. Stat. § 103B.251.

B. For improvements related to water quantity:

1. A Member shall be responsible for the costs of construction of that portion of a drainage system that is located within its borders and that is necessary to accommodate its Allowable Flow and the Allowable Flow of all other tributary Members.

2. A Member shall also be responsible for its share of construction costs of a drainage system, whether or not that system is located within its borders, that is necessary to convey Excessive Flows originating within the Member's borders.

3. Increased costs of construction incurred for acquisition of lands, easements and rights of way within natural watercourses shall be the obligation of the Member in which the land lies and shall not be apportioned to other Members to the extent that such costs exceed costs which would have been incurred if there had been no improvement on such lands, easements, or rights of way.

4. Costs of construction shall include all costs associated with a WMO approved improvement (whether trunk sewer or natural conveyance) and whether or not actually constructed, including, but not limited to, costs for design, administration, construction supervision, legal fees, acquisition of lands and improvements and actual construction and maintenance costs.

5. The WMO shall consider any grant money received or to be received by a Member for sanitary sewer/storm sewer separation or for the construction, reconstruction or replacement of storm sewer facilities before making cost allocations among Members and may consider the application of any grant proceeds toward the cost of the improvement before allocating costs between or among the Members involved, provided that such allocation would not violate the terms and conditions of the grant.

6. The attached Exhibit B is incorporated by reference and serves as a compilation of general examples of cost allocation under this Agreement for the hypothetical circumstances stated in the examples.

Subdivision 8. Capital Cost Allocation of Improvements Delineated in Local Watershed Management Plans. All capital improvement costs incurred by the WMO for improvements delineated in local watershed management plans that benefit only that Member, which the WMO undertakes because the Member fails to do so, shall be apportioned entirely to that Member.

SECTION 11. SPECIAL ASSESSMENTS. The WMO shall not have the power to levy special assessments. All such assessments shall be levied by the Member within which the land is located.

SECTION 12. DURATION.

Subdivision 1. Each Member agrees to be bound by the terms of this Agreement until January 1, 2012. It may be continued thereafter upon the agreement of all the parties.

Subdivision 2. This Agreement may be terminated prior to January 1, 2012, by the written agreement of a majority of the Members.

Subdivision 3. In addition to the manner provided in Subdivision 2 for termination, any Member may petition the Board to dissolve the WMO. Upon thirty (30) days' notice in writing to the clerk of each Member, the Board shall hold a hearing and upon a favorable majority vote of all eligible votes of the Members, the Board may by resolution recommend that the WMO be dissolved. The resolution shall be submitted to each Member and if ratified by a majority of the governing bodies of all Members within sixty (60) days, the Board shall then give ninety (90) days written notice of its intent to dissolve the WMO to Dakota County, Ramsey County and the Board of Water and Soil Resources. After the expiration of this 90-day notice period, the Board shall dissolve the WMO, allowing a reasonable time to complete work in progress and to dispose of personal property owned by the WMO.

SECTION 13. DISSOLUTION. Upon dissolution of the WMO or termination of this Agreement, all property of the WMO shall be sold and the proceeds thereof, together with monies on hand, shall be distributed to the Members. Such distribution of WMO assets shall be made in proportion to the total contribution to the WMO required by the last annual Budget.

SECTION 14. EFFECTIVE DATE. This Agreement shall be in full force and effect when all seven (7) Members file a certified copy of a resolution approving this Agreement and have executed this Agreement and filed the executed Agreement with the Board. All Members need not sign the same copy.

IN WITNESS WHEREOF, the undersigned governmental units, by action of their governing bodies, have caused this Agreement to be executed in accordance with the authority of Minn. Stat. § 471.59.

Approved by the City Council

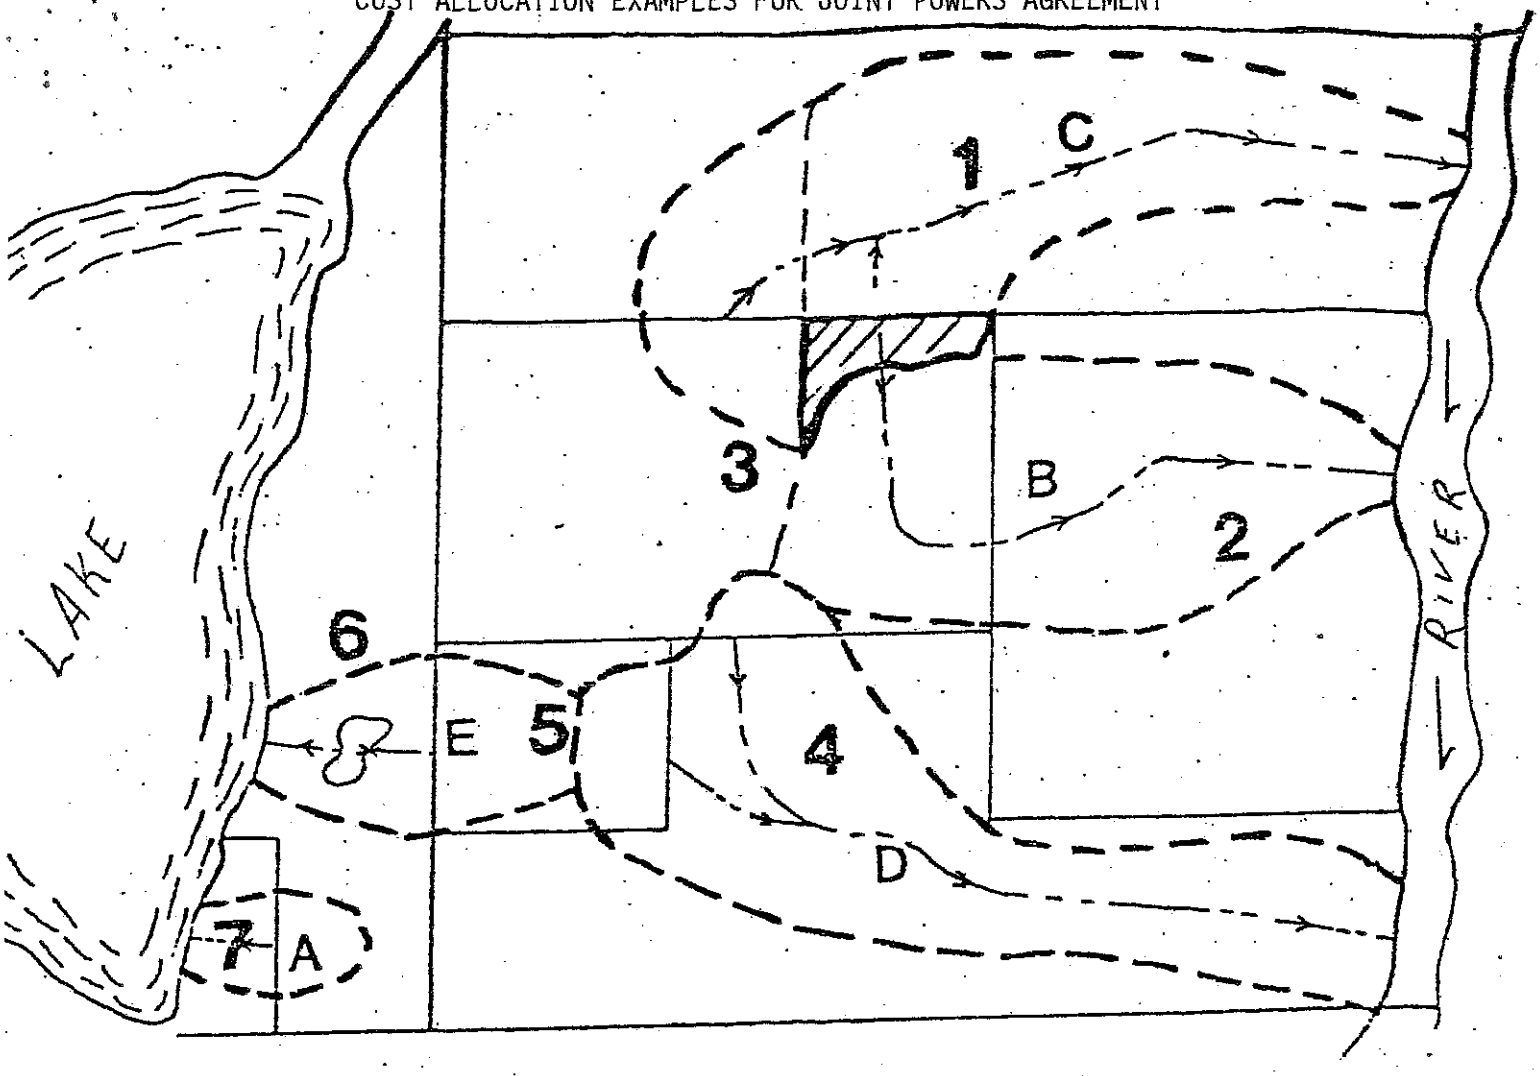
COST ALLOCATION EXAMPLES FOR JOINT POWERS AGREEMENT



EXAMPLE	DESCRIPTION
A.	Two Cities
B.	Two Cities With Diversion In
C.	Two Cities With Diversion Out
D.	Three Cities
E.	Added Ponding

LEGEND

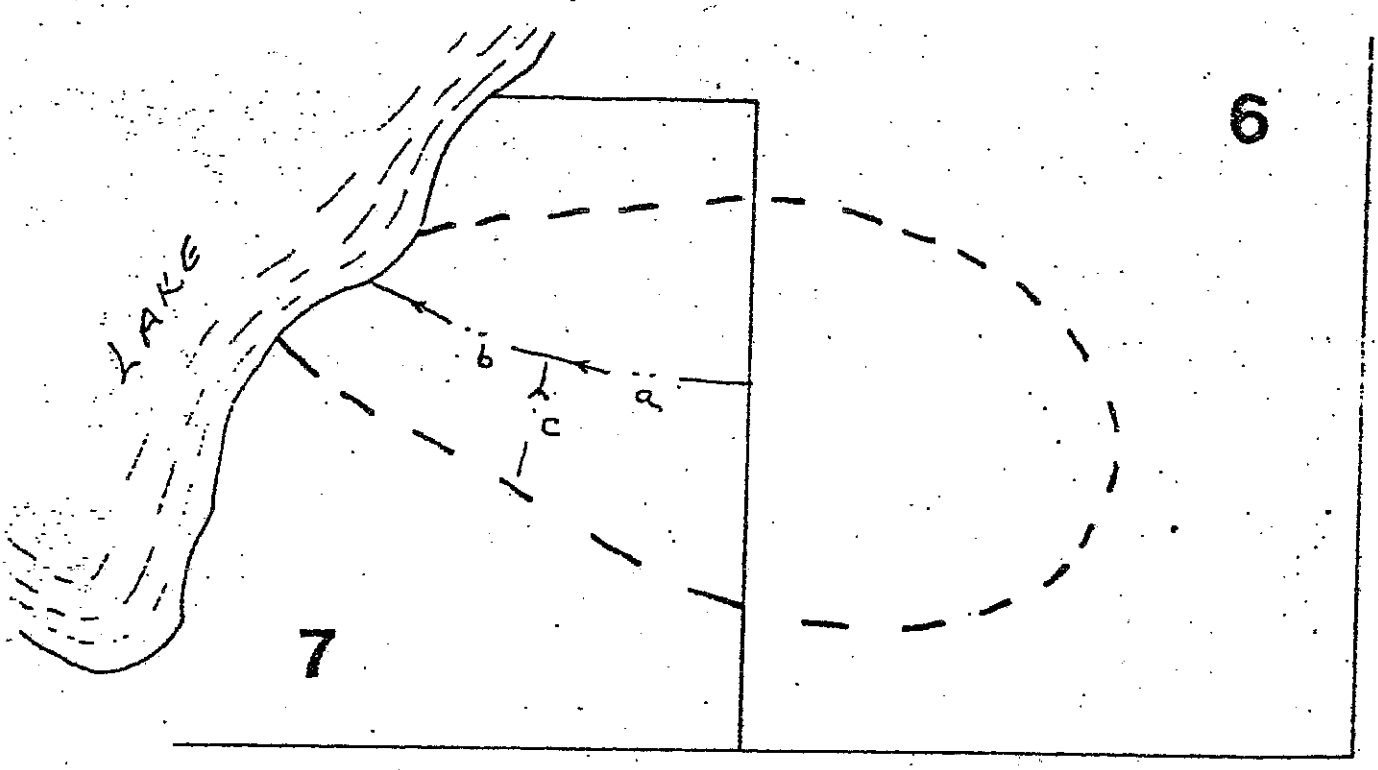
Watershed Boundary

Drainage Facility

City Boundary

Detention Pond

Diverted Area



EXAMPLE "A" - TWO CITIES

Project: Construct project (Segments "a" and "b") in City #7 to provide drainage for Cities #6 and #7 under fully developed conditions.

Cost Allocation:

City #6: Cost share $= \frac{Q_{E6}}{Q_T} \times$ Total project cost for "a".

City #7: Cost share = Total project cost $- \left(\frac{Q_{E6}}{Q_T} \times \text{Total project cost} \right)$

Where: $Q_{E6} = Q_{T6} - Q_{A6}$;

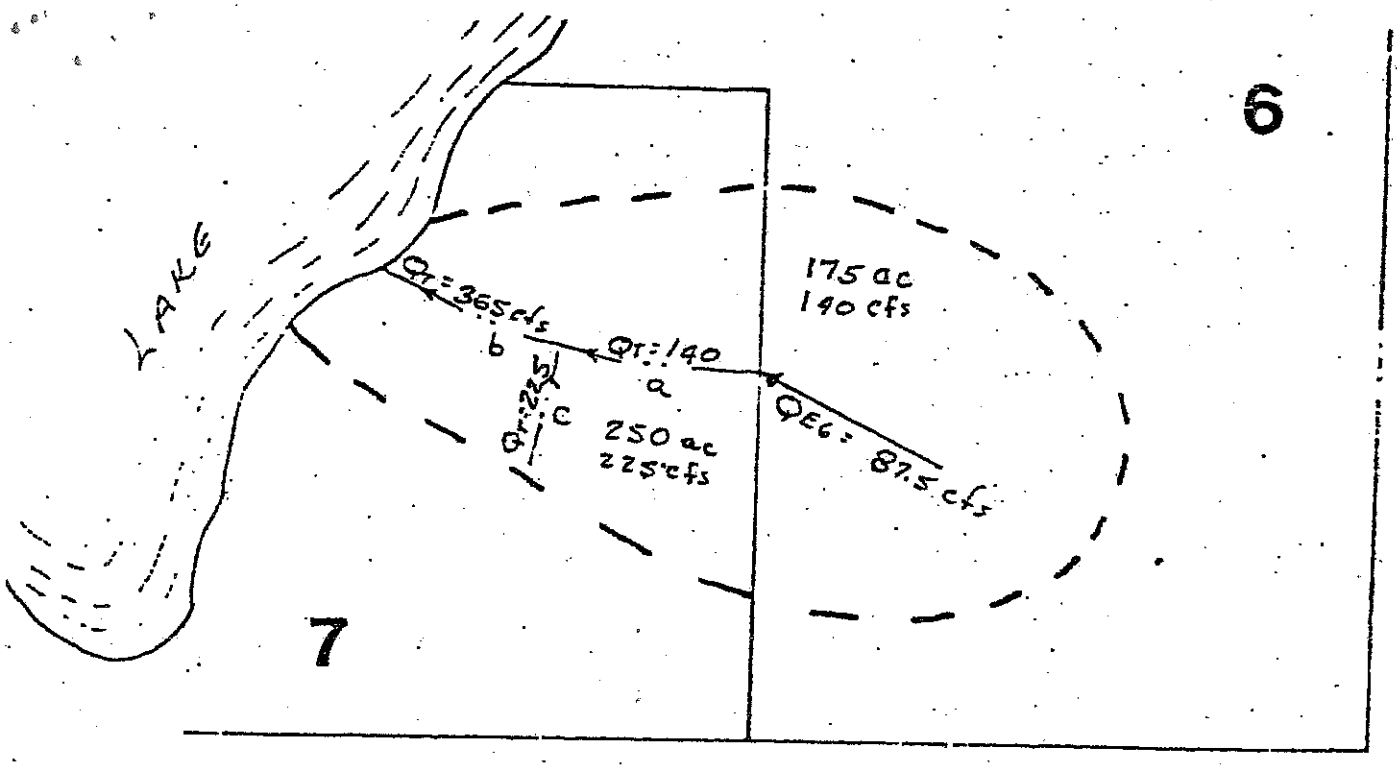
Q_{E6} is the design flow rate from City #6 which is in excess of the allowable flow rate from City #6;

Q_{A6} is the allowable flow rate from City #6;

Q_{T6} is the total design flow rate from City #6;

Q_T is the total flow rate for which the project is designed in each Segment.

City #6: Cost share for Segment "c" = Zero dollar (no tributary flow).



EXAMPLE "A" - TWO CITIES

Sample Calculations

Assume:

City #6 - Area of Watershed within City #6 = 175 acres
Full development runoff (Q_{T6}) = CIA = 0.40 x 2.0"/h x 175 = 140 cfs
Predevelopment runoff (Q_{A6}) = CIA = 0.15 x 2.0"/h x 175 = 52.5 cfs

Then:

Excess runoff (Q_{E6}) (from formulae: $Q_E = Q_T - Q_A$) = 87.5 cfs

1. City #6 cost share for Segment "a" = $\frac{87.5}{140}$ x project cost for "a" = .63 x Project cost for "a".

(From formulae: share = $\frac{Q_E}{Q_T}$ x Project cost)

Note: Segment "a" ends at first point of entry into the system from City #7.

Assume:

City #7 - Area of Watershed within City #7 = 250 acres and all flows from City #7 enter system by way of Segment "c".
Full development runoff (Q_{T7}) = CIA = .50x1.8x250 = 225 cfs
Design flow for Segment "b" = $Q_{T(SEG.\ "a")} + Q_{T7}$ = 140 + 225 = 365 cfs

2. City #6 has no cost share obligation in Segment "c" when there is no tributary flow from City #6.

(continued)

Then:

3. City #6 cost share for Segment "b" = $\frac{87.5}{365}$ x Project cost for "b" = 0.24 Project cost of "b".

(From formulae: Share = $\frac{Q_{E6}}{Q_T}$ x Project cost)

Note:

City #6 can reduce the excess flow (Q_{E6}) by detention ponding even to the amount that the rate of flow from City #6 (Q_{T6}) is no greater than the allowable flow rate (Q_{A6}). Any reduction in the total rate from City #6 would be applied to the excess rate and thereby reduce the obligation of City #6 to share in the cost of constructing any conveyance system in City #7.

SUMMARY OF COSTS

Segment "a":

City #6: Cost share = $\frac{87.5}{140}$ x Project cost for "a".

City #7: Cost share = $\frac{52.5}{140}$ x Project cost for "a".

Segment "b":

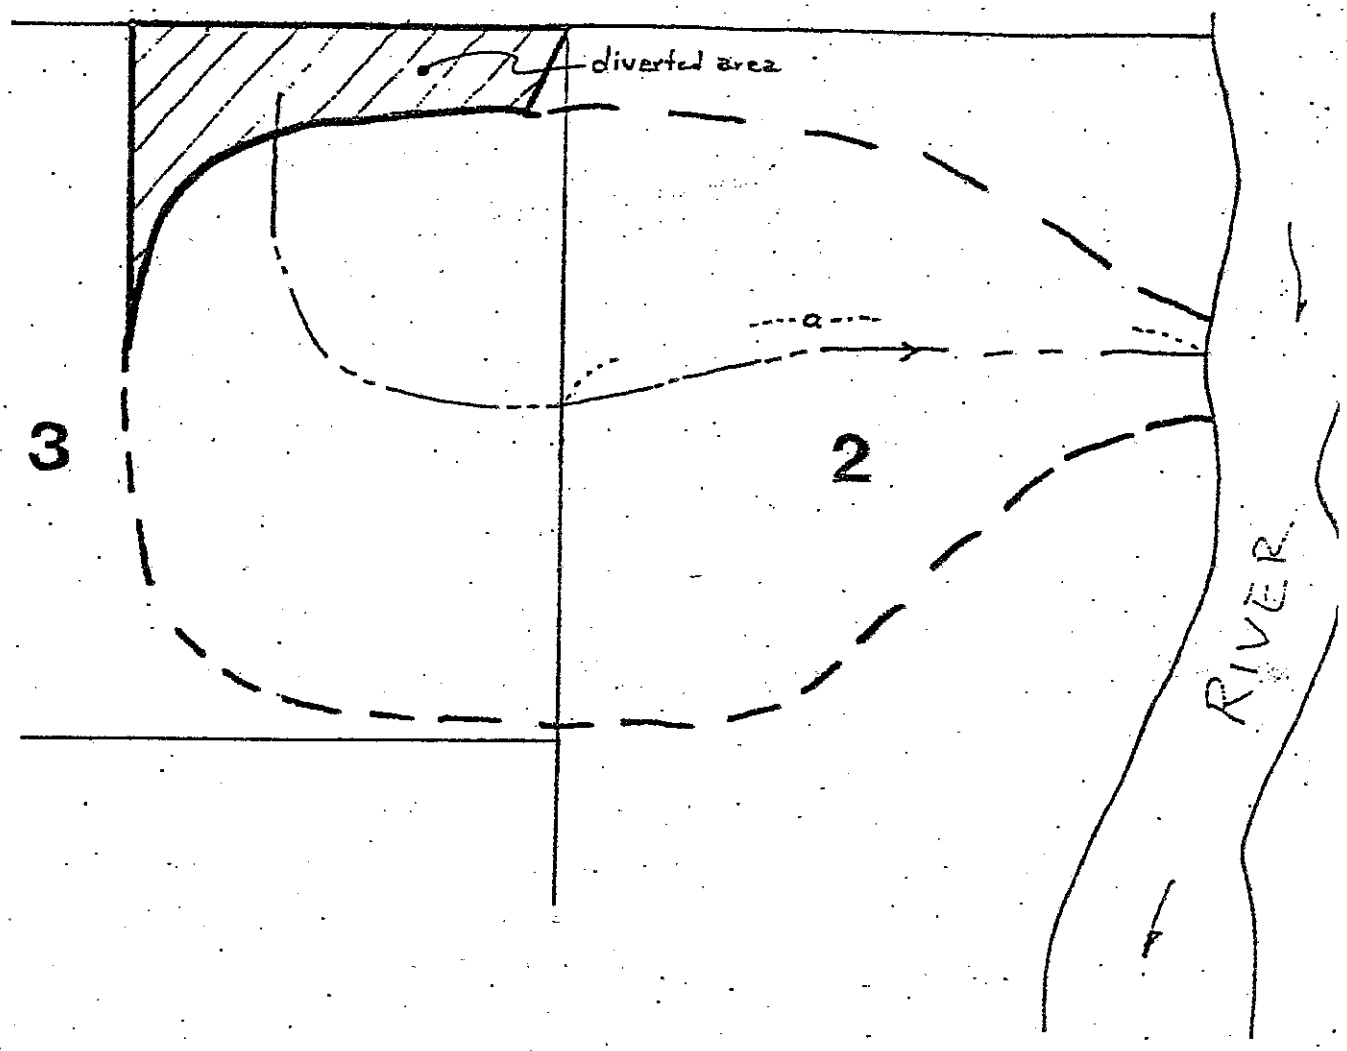
City #6: Cost share = $\frac{87.5}{365}$ x Project cost for "b".

City #7: Cost share = $\frac{277.5}{365}$ x Project cost for "b".

Segment "c":

City #6: Cost share = Zero dollar (no tributary flow).

City #7: Cost share = All of Project cost for "c".



EXAMPLE "B" - TWO CITIES WITH DIVERSION IN

Project: Construct Trunk facility "a" in City #2 only for Cities #2 and #3 under fully developed conditions.

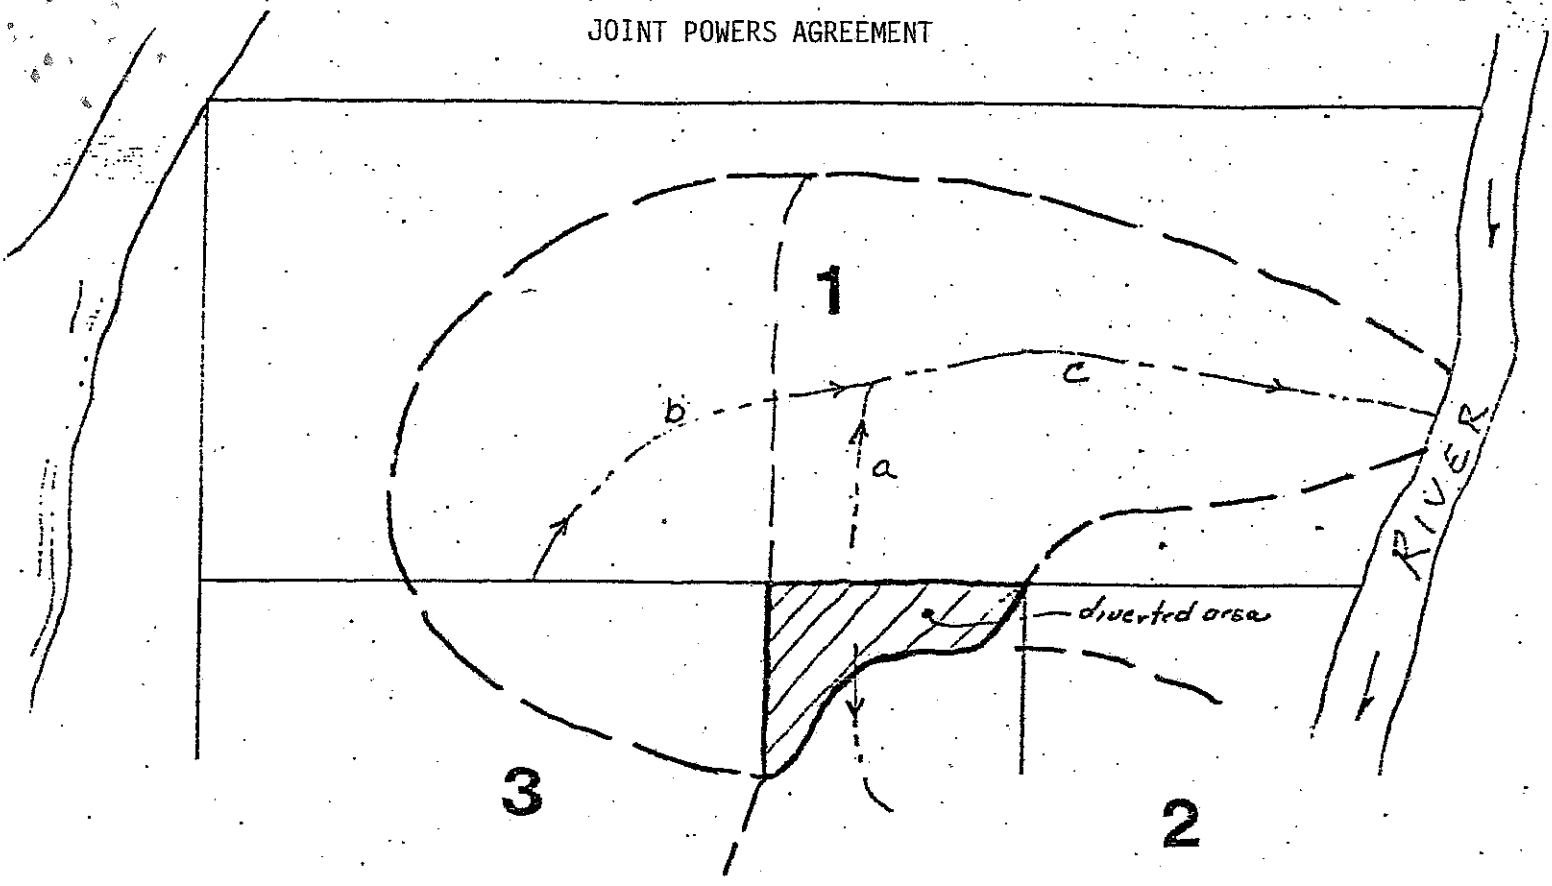
Cost Allocation:

City #3: Cost share $= \frac{Q_{E3}}{Q_T} \times$ Total project cost.

Where: $Q_{E3} = Q_{T3} - Q_{A3}$
And Q_{E3} is the design flow from City #3 as described in Example "A" plus all flows coming from the area diverted. All facilities within City #3 are constructed by City #3. Detention in City #3 can reduce Q_{E3};

Q_T and Q_A are as defined in Example "A".

Note: This case applies only where waters are diverted from one City to another City or from one major drainage district to another.



EXAMPLE "C" - TWO CITIES WITH DIVERSION OUT

Project: Construct Trunk Segments "a", "b", "c" in City #1 under fully developed conditions.

Cost Allocation:

City #3: Cost share for Segment "a" = Zero dollars (all flows have been diverted away)

Cost share for Segment "b" $= \frac{Q_{E3}}{Q_T} \times$ Total project cost for "b".

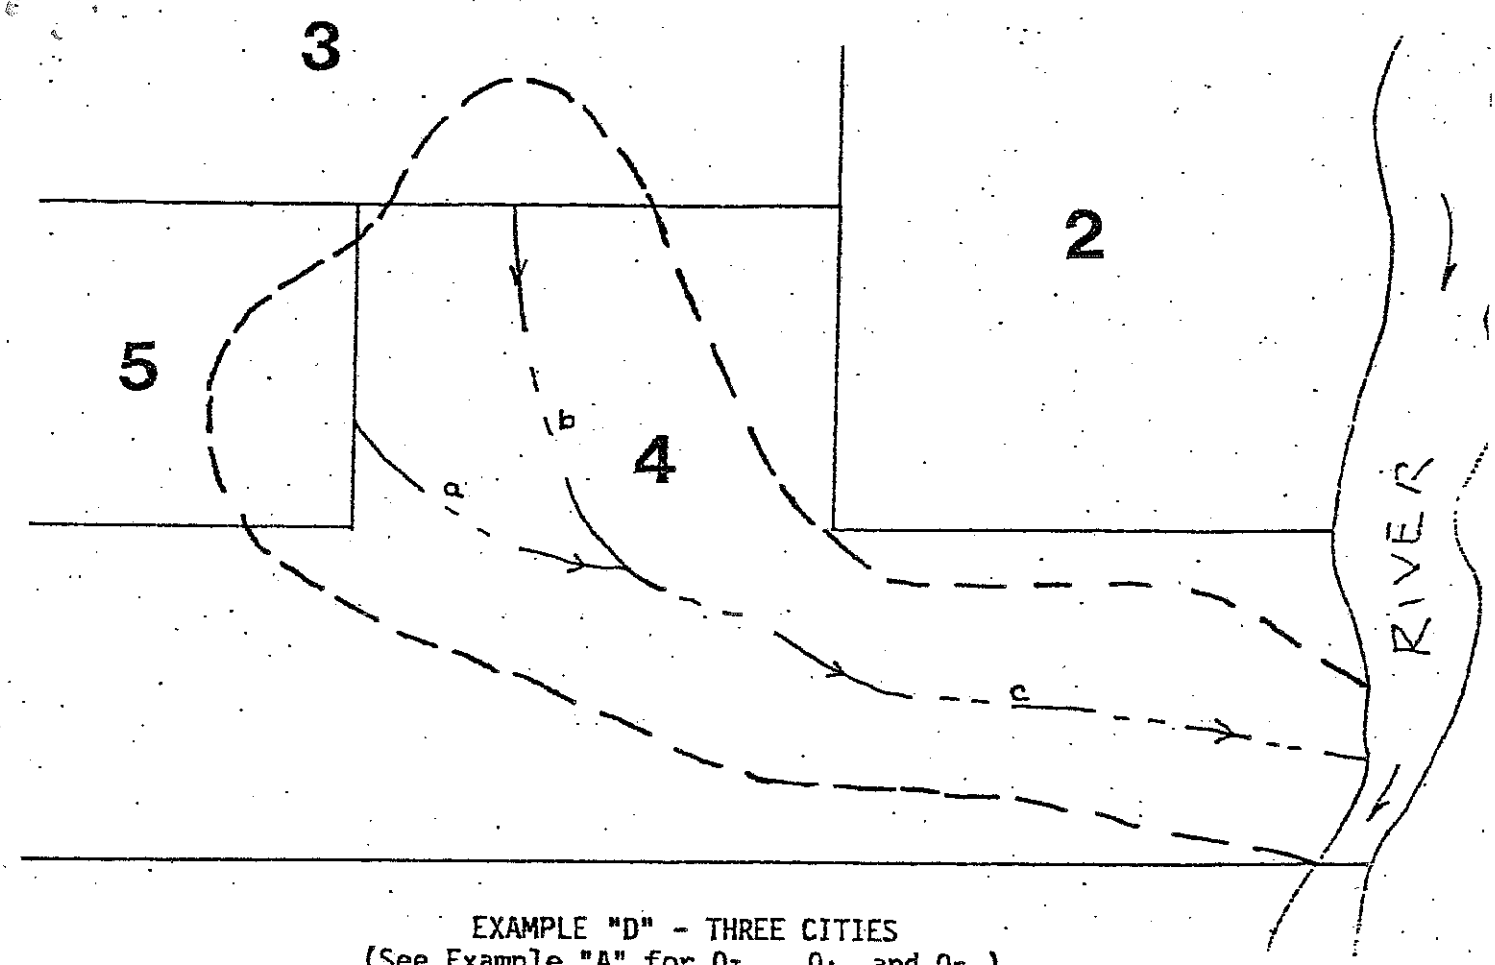
Where: Q_{E3} is the excess flow from City #3 that is tributary to Segment "b" only.

City #3: Cost share for Segment "c" $= \frac{Q_{E3}}{Q_T} \times$ Total project cost for "c".

Where: Q_{E3} is the excess flow from City #3 that is tributary to Segment "c" calculated as Q_{E3} tributary to "b" minus Q_{A3} that would have been tributary to "a" had there been no diversion out of the drainage district.

Q_T and Q_A are as defined in Example "A".

Note: This case applies only where waters are diverted from one City to another City or from one major drainage district to another.



EXAMPLE "D" - THREE CITIES
(See Example "A" for Q_T, Q_A and Q_E)

Project: Construct Project (Segments "a", "b" and "c") in City #4 to provide drainage for Cities #3, #4, and #5 under fully developed conditions.

Cost Allocations:

City #3: Cost share Segment "b" = $\frac{Q_{E3}}{Q_T}$ x Project cost for "b".

Cost share Segment "a" = Zero dollars (no tributary flow).

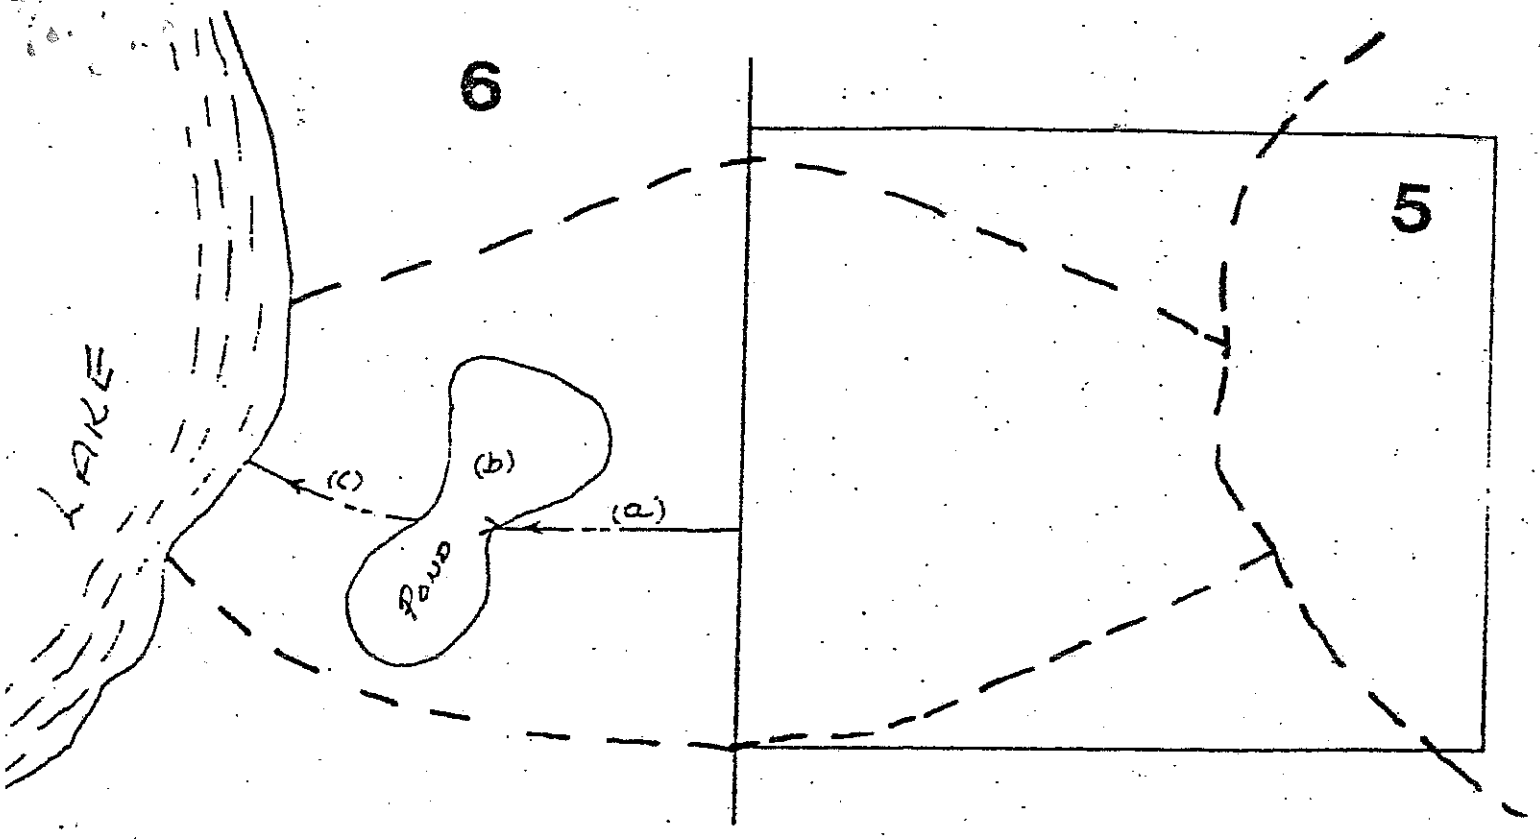
Cost share Segment "c" = $\frac{Q_{E3}}{Q_T}$ x Project cost for "c".

City #5 Cost share Segment "a" = $\frac{Q_{E5}}{Q_T}$ x Project cost for "a".

Cost share Segment "b" = Zero Dollars (no tributary flow).

Cost share Segment "c" = $\frac{Q_{E5}}{Q_T}$ x Project cost for "c".

Where: Q_T is the total flow rate for which each respective Segment is designed.



EXAMPLE "E" - ADDED PONDING
(See Example "A" for definition of Q_T , Q_A and Q_E)

Project: Construct Trunk "a", Detention Pond "b" and Outlet "c" for cities #5 and #6 under fully developed conditions.

Cost Allocation:

City #5 (Trunk "a"): Cost share $= \frac{Q_{E5}}{Q_T}$ x Project cost of Trunk "a".

Where: Q is the total flow rate in Trunk "a".

City #5 (Pond "b"): Cost share $= \frac{V_{E5}}{V_T}$ x Project cost of Pond "b".

Where: V_{E5} is the design Volume of runoff from City #5 which is in excess of the allowable Volume from City #5;

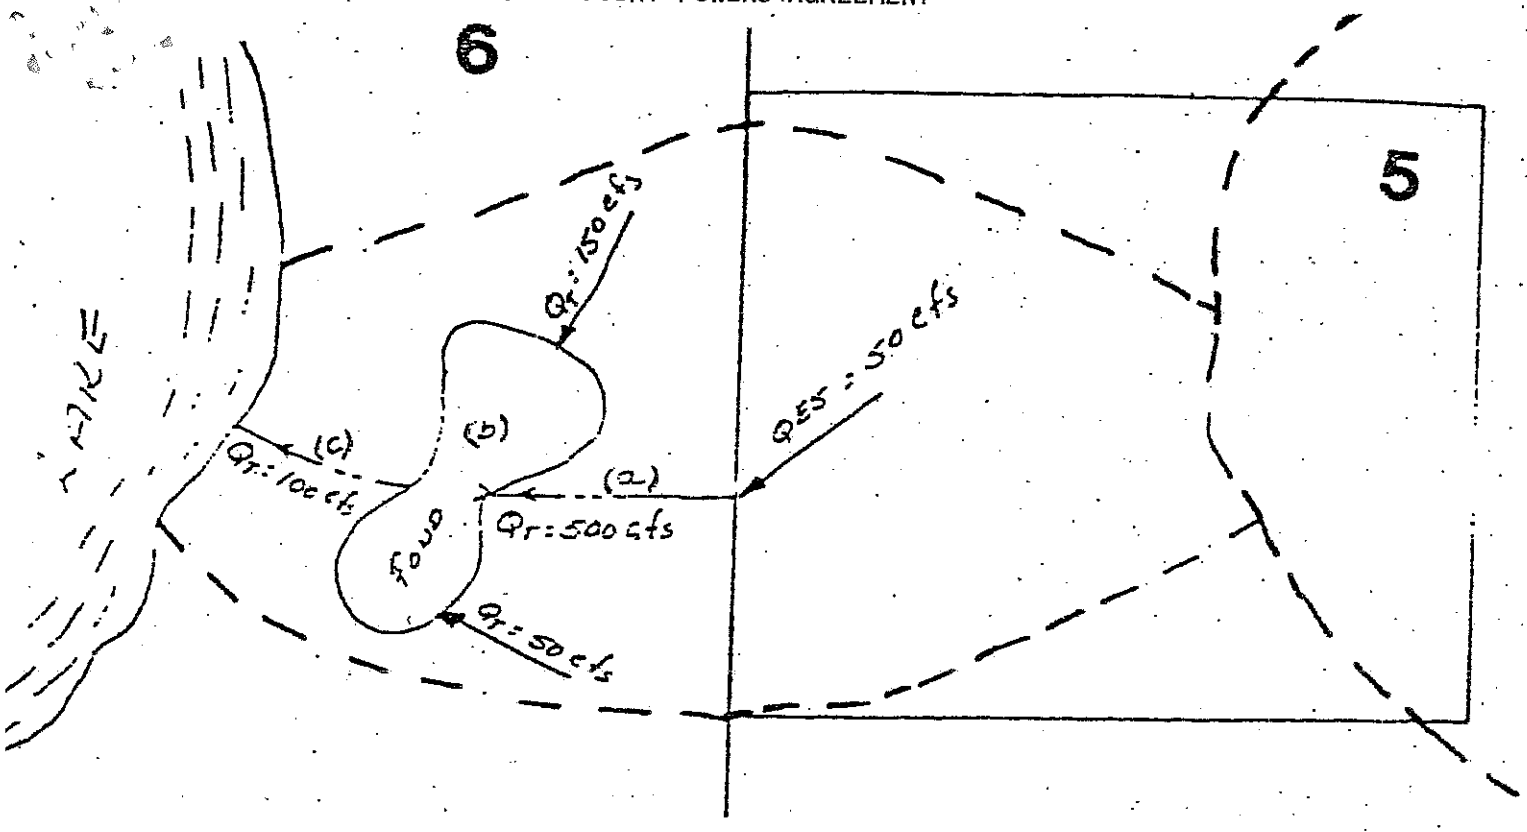
V_T is the total Volume used in the design of the detention pond.

City #5 (Outlet "c"): Cost share $= \frac{Q_{E5}}{Q_T}$ x Project cost of Outlet "c".

Where: Q_{E5} is reduced from Trunk "a" Inlet Q_{E5} by the ratio of $\frac{\text{Outlet } Q_T}{\text{Inlet } Q_T}$;

Inlet Q_T is the summation of all flows into the pond;
Outlet Q_T is the total flow rate out of the pond under design conditions.

Note: See Page 9 for sample calculations



EXAMPLE "E" - ADDED PONDING

Sample calculation for City #5 cost share for Outlet "c":

Assume:

Q_{E5} = 50 cfs

Q_T Pond inflow in Segment "a" = 500 cfs

Q_T Pond inflow from other areas = 200 cfs

ΣQ_T Pond inflow = 700 cfs

Q_T Pond Outlet "c" = 100 cfs

And:

$$Q_{E5\ (OUTLET)} = Q_{E5\ (INLET)} \times \frac{Q_{T\ (OUTLET)}}{\Sigma Q_{T\ (INLET)}}$$

$$\text{City \#5 cost share} = \frac{Q_{E5\ (OUTLET)}}{Q_{T\ (OUTLET)}} \times \text{Project cost of Outlet "c"}$$

Then:

$$Q_{E5}\ \text{(for Segment "c")} = \frac{100}{700} \times 50 = 7.14\ \text{cfs}$$

$$\text{City \#5 cost share} = \frac{7.14}{100} \times \text{Project cost of Outlet "c"}$$

MEMORANDUM

TO: Lower Mississippi River Watershed Management Organization Managers

FROM: James R. Langseth

SUBJECT: Allowable Flow - Summary of Understanding Based on the Discussions at the Informal Meeting Held February 1, 1988

DATE: March 9, 1988

Allowable Flow - Rate of Flow Calculation

Allowable flow is a set of conditions defined for the purposes of cost apportionment. Allowable flow is not a historic condition or a natural condition of the watershed. The application of the Joint Powers Agreement (JPA) provisions for allowable flow calculation was interpreted as described below.

1. The allowable flow calculation shall be based on the following watershed, land use, precipitation event, and drainage system definitions:

    a. Watershed: Consists of the entire tributary watershed, defined by natural flow pathways, overflow routes, and the drainage system existing as of the effective date of the JPA.

        1) Landlocked areas are included.

        2) Areas diverted in by the drainage system existing as of the effective date of the JPA are included.

        3) Areas diverted out by the drainage system existing as of the effective date of the JPA are not included.

4) Natural flow pathways and overflow routes are defined by the topography available as of the effective date of the JPA.

b. Land use: The entire tributary watershed is considered to contribute flow as if it were all in a "natural vegetation" state.

1) Regardless of past or present land use or vegetation, landlocked status, proportion covered by water surface, or other "natural condition" land use variables, all areas are treated as land surface.

2) All stormwater detention basins, including lakes, are considered as though they had been filled and are treated as land surface in the analysis.

3) The runoff coefficient "C" for the Rational Method is to be 0.15 for "natural conditions". Other computational methods shall select variables which provide similar representations of conditions (for example, the percent impervious for the Barr Hydrograph Method will probably be 0% for "natural conditions").

c. Precipitation event: critical 10-year frequency storm.

1) The Joint Powers agreement examples use the Rational Method and imply the critical frequency storm is a 10-year frequency rainfall intensity for a duration corresponding to the time of concentration of the watershed.

2) For hydrograph methods, the critical storm is that storm resulting in the highest peak flowrate. This will most likely be a storm having its peak rainfall rate at a time approximately equal to the watershed time of concentration.

d. Drainage system: A developed conveyance system is assumed to exist, that is, runoff is efficiently conveyed to the outlet in a system adequate to convey the 10-year runoff rates.

1) Times of concentration are to be appropriate to the typical slopes of the subwatersheds.

2) Flow velocities are to be appropriate to 10-year drainage system design.

3) No storage routing is considered because detention basins are considered not to exist.

2. To determine Excess Flow - Rate of Flow:

a. the allowable rate of flow shall be compared to the greater of:

1) The 10-year frequency critical storm design rate of flow.

2) Where there is a detention basin at the outlet of the upstream community's drainage system: the 100-year frequency critical storm design rate of flow.

b. The design condition will use:

1) Anticipated ultimate tributary watershed

2) Ultimate land use development, with appropriately applied runoff ("C") factors

3) Design storm - the critical duration 10-year or 100-year frequency event

4) Proposed drainage system, including detention basins and including the routing of runoff through those basins

Allowable Flow - Volume of Flow Calculation

1. The meaning of Allowable Flow - Volume of Flow, used for cost sharing on downstream detention basins, was not specifically discussed at this meeting. However, based on the discussion and reading the JPA, I have the following understanding:

   a. Watershed: as above (1.a.)

   b. Land use: as above (1.b.)

   c. Precipitation event: The 100-year frequency storm that is critical for the conveyance system design. (The JPA specifies the 100-year frequency 24-hour precipitation event as the criteria for detention basin design, but I interpret this to mean the critical duration storm.)

   d. Drainage system: as above (1.d.)

   e. Allowable flow: Volume of flow is the total runoff volume from the storm.

2. To determine Excess Flow - Volume of Flow: the allowable volume of flow shall be compared to the total runoff volume from the design storm, less the design volume of the upstream community's detention basins.

BARR ENGINEERING CO.

MEMORANDUM

TO: Jim Langseth/File
FROM: Dennis Palmer
SUBJECT: LMRWMO Cost Allocation Formula
DATE: August 18, 1988

The following paragraphs summarize my interpretation of the cost allocation formula based on my reading of the Joint Powers Agreement, the memorandum from the February 1, 1988 meeting, the memorandum of June 22, 1988 from SEH, the letter of June 22 from the WMO attorney, and what I believe to be a reasonable and workable solution.

In general, an upstream community will be permitted to discharge an "allowable flow" without being required to participate in the cost of the downstream conveyance system. The cost to be apportioned to an upstream community will be based upon flows which exceed the "allowable flow". Calculation of the allowable flow involves: 1) definition of the contributing watershed, and 2) application of hydrologic criteria for the calculation of flow from that watershed.

(1)

- The watershed should be that ". . . area within a line drawn around the extremities of all terrain whose surface drainage is tributary . . ." to the point at which the allowable flow is to be calculated.

  Comment: The quoted portion of the above definition comes from Section 3, Subdivision 10 of the Joint Powers Agreement, where it refers to the watershed of the WMO as being that area tributary to the Mississippi River. A similar definition would include landlocked areas in the watershed area when calculating allowable flow. However, the definition of "allowable flow" in Section 3,

Subdivision 3 could be strictly interpreted as excluding any landlocked areas which had not been provided an outlet as of the enactment date of the agreement. Thus, I believe the agreement is technically unclear as to consideration of landlocked areas.

The following thoughts are offered as a rationale for addressing landlocked basins. I have no personal knowledge of the intent of those who framed the Joint Powers Agreement; however, I believe that the tributary watershed should include any landlocked basins tributary to the point in question for the following reasons:

1) I believe we should presume that engineers and planners operating within and designing systems for an urban environment would have included within the design of any existing systems some allowance for future flow from presently landlocked areas. Thus, in Section 3, Subdivision 3 of the Joint Powers Agreement, I believe it would be appropriate to interpret that ". . . drainage system in place . . ." refers to a system which allows for ultimate discharge from such areas, whether or not they were landlocked as of the enactment date of the agreement. Note that I have no firsthand knowledge of discussions that took place between those who drafted this agreement - I am stating an opinion as to what my intent would have been.

2) When the effect of ponding in a landlocked area is considered, the contribution of the landlocked area to the allowable flow at the point in question will probably be negligible, and the inclusion of the landlocked area will therefore have little, if any, effect on cost allocation for the conveyance system or storage facilities downstream.

For landlocked basins entirely within a single community and when a landlocked basin occurs at a drainage boundary between communities, an allowable flow must be determined in order to apply the cost allocation formula in the agreement. I propose the following:

(2)

- The allowable flow from landlocked basins will be 0.0252 cfs per acre.

  Comment: Under natural conditions, the effective outflow is limited to seepage and is very small. Thus, it follows that a snowmelt event would be critical. The 100 year snowmelt is approximately 6 inches of runoff in 10 days. I propose that the allowable flow from a landlocked basin be defined as the 100 year runoff (6 inches of runoff in 10 days) or an average of 0.0252 cfs per acre. Note that this is much less than the flow which would be calculated using a rational coefficient of 0.15.

  An alternative procedure would be to permit discharge from landlocked basins at no cost to the discharging community unless their discharge required oversizing of downstream systems. In that case, the upstream community would pay for the actual cost of oversizing the downstream conveyor to accommodate discharge from the landlocked basin. In practice, this would mean that the upstream community would participate in the cost of a limited length of the downstream system since local peak discharges soon become the prevailing design criteria when compared with outflow rates from upstream storage basins. This alternative is not favored because it differs more greatly from the formula in the agreement than does the defined allowable flow above.

(3)

- Delineation of the watershed area should consider the conveyance system in place as of the date of the enactment of the agreement. The conveyance system should be interpreted to include (1) all detention areas which had been constructed as a part of the drainage system in place and (2) all detention areas which happened to occur because of ". . . the characteristics of the land on the date of enactment . . ." (from Section 3, Subdivision 12).

Comment: Storm sewer systems which existed as of the date of enactment may have altered the natural watershed divides. If an area is diverted away from the point where allowable flow is to be calculated, the agreement is clear; Section 3 subdivision 3 excludes any flow which is diverted away by the system in place. However, I believe that the agreement intends to include any water which may have been diverted into the watershed being considered by in-place systems. Likewise for calculating the allowable flow I believe the agreement intends to include any waters contributed by existing systems serving areas which were landlocked in their natural state.

Detention basins should be considered to be a "characteristic of the land on the date of enactment". As such, they are a part of the conveyance system and should be considered in the calculation of allowable flow. To ignore their effects would result in an allowable flow that was unreasonably high, just as to ignore landlocked basins could yield an allowable flow that was unreasonably low.

(4) • For calculation of allowable flow, the same criteria should be used as was employed for calculation of the design flow, except that runoff factors should be appropriately reduced (C=0.15) to represent undeveloped watershed conditions.

Comment: The design flow at a given point would be (1) that flow calculated to result from a 10-year rainfall event, or 2) the peak outflow from ponds immediately upstream of the point in question (which results from the critical 100-year runoff event), whichever is greater. The allowable flow should be calculated in exactly the same manner, assuming the drainage system at the time of enactment and non-urban conditions. It is conceivable that a well-designed storage basin could actually reduce the peak flow from an urban area to a level below that which would occur under natural conditions, as defined in the agreement. It is therefore

necessary to consider both the 10 year and 100 year events when calculating the allowable flow.

The use of a Rational Formula coefficient equal to 0.15 appears to be an agreed upon compromise developed by the technical advisors to those who drew the Agreement. It will adequately serve the purpose for which it was intended. It should not, however, be used to exclude the calculation of allowable flow by hydrograph methods and other standard engineering techniques.

BARR ENGINEERING CO.

MEMORANDUM

TO: File

FROM: Jim Langseth

SUBJECT: Allowable Flow

DATE: August 25, 1988

A meeting was held on August 11, 1988 to discuss the meaning of allowable flow as defined in the Joint Powers Agreement (JPA). This meeting was attended by Jim Langseth representing Barr Engineering, John Sachi representing Inver Grove Heights, Bill Price representing Sunfish Lake, Jim Danielson representing Mendota Heights, Skip Stephaniak representing West St. Paul, and Mark Loebermeyer from SEH and Bob Simon representing South St. Paul.

A letter inviting all members and alternates of the Lower Mississippi River Watershed Management Organization to the meeting had been mailed out prior to the meeting. Copies of the letter had also been distributed to all advisors to the LMRWMO. In that letter four topics were identified for discussion at the meeting. A copy of the letter is attached. For each of the topics, a series of reasonable interpretations of the agreement were presented in the letter. It was hoped that the group would agree on one set of interpretations.

Bill Price, Skip Stephaniak, and Jim Danielson had been involved at one level or another in the formulation of the allowable flow definitions in the JPA. Bill Price had been retained by the framers of the JPA to prepare the examples in the JPA. Bill Price explained some of the factors that went into the formulation of the allowable flow concept. First, the upstream communities have the right to discharge some flow downstream without cost. Second, the examples were simplified so that they would be easy to apply and would serve to illustrate the fundamental concepts. Third, the examples in the JPA must be used to interpret the language regarding these matters.

Skip Stephaniak explained that the "C" factor of 0.15 was a compromise number that was arrived at as a way to reduce the variability in the calculation of allowable flow.

Mark Loebermeyer, speaking for South St. Paul, suggested that if the examples defined allowable flow then they could also be used to define excess flow. One could simply change the "C" factor from natural conditions to developed conditions to arrive at the excess flow.

Bob Simon pointed out that the examples might be for illustration but were not definitive. A reference to the examples was found in the JPA. That reference occurs on page A-15 of the JPA in the Watershed Management Plan. Section 9, Subdivision 6(f) of the JPA states "The attached Exhibit A is incorporated by reference and serves as a compilation of general examples of cost allocation under this agreement for the hypothetical circumstances stated in the examples."

Bill Price pointed out that during the discussions leading to the JPA, the possibility was discussed that a community could hold back enough water so that they would not owe any cost sharing for downstream construction.

The position maintained by the representatives from South St. Paul through all of the discussions was that calculation of allowable flow and design flow should be commensurate. They should be done using the same watershed, the same drainage system, the same ponds, and so forth. That is, if allowable flow is calculated without ponds, excess flow should be calculated without ponds. If design flow is calculated including ponds, allowable flow should be calculated including ponds. The South St. Paul representatives maintained that the examples and the language of the Joint Powers Agreement provided no basis for calculation of allowable and excess flows by two different approaches.

After further discussion, the questions raised in the letter of August 5 were discussed directly. A summary of the discussion of those questions follows:

1. What is the allowable flow from landlocked areas (such as the watershed tributary to Sunfish Lake)?

   Three communities indicated that the allowable flow would be an amount determined by the methods in the examples incorporated in the Joint Powers Agreement. By this they meant that the allowable flow is determined by the rational method applying a "C" factor of .15, rainfall intensity according to the time of concentration of the watershed, and the full watershed area. Inver Grove Heights indicated that they would answer D, "other", by which they meant that the allowable flow would be related to the ultimate development drainage system (answer B from Question 2). South St. Paul indicated the answer was B: the allowable flow would depend upon the drainage system in place on October 1, 1985. This implied that if no drainage system were in place there would be no allowable flow in that landlocked area.

2. What is the drainage system in place and the definition of "allowable flow"?

   Four communities indicated that the answer would be C, a hypothetical system adequate to convey only the allowable flow with no ponding considered. One community elaborated to explain that this implied that there would be a whole new hypothetical drainage system in place sufficient to carry the allowable flow rate. South St. Paul indicated that the drainage system in place meant the system in place on October 21, 1985. West St. Paul pointed out that the date was meant to define when waters were considered diverted in or out of a watershed and was not intended to define ponds and detention basins and the drainage system that should be used in the calculation of allowable flow. Bill Price pointed out that the language regarding diversion was added because there was existing diversion even at that stage. Thus the diverted waters in Section 3, Subdivision 3 of the JPA refers to the waters diverted after the signing of the JPA.

There was some discussion of whether or not DNR-protected public waters could be ignored in calculating allowable flow.

3. What shall the allowable flow storm be?

This question was more or less skipped because with allowable flow being defined as incorporating the examples in the back of the JPA, the allowable flow from an upstream community is defined as the 10-year frequency discharge. The initial answers indicated by the parties were that the allowable flow storm should be the 10-year frequency for pipes and 100-year frequency only for open channels and pond volumes, but that the upstream community allowable flow is computed without ponds.

4. How are detention basins treated in calculation of allowable flow?

Four of the communities indicated that the answer is A. Detention basins are ignored as in Example "A" of Exhibit A of the JPA. South St. Paul indicated the answer would be either B, as defined by the topographic data available on October 21, 1985 or C, as defined by the drainage system in-place on October 21, 1985 or a combination of both.

Following this discussion, a vote was taken on what to tell the Board regarding the outcome of the meeting. What we agreed to report to the Board was that the Committee could not come to unanimous agreement on the meaning of allowable flow, but the majority supported the definition as explained in the memo from the February 1, 1988 meeting. The meeting concluded after this vote.

LMRW/322,0/tvo

MEMORANDUM

TO: Lower Mississippi River Watershed Management Organization

FROM: James R. Langseth

DATE: February 19, 1992

RE: Allowable Flow, Summary of Understanding Based on the Discussions at the Meeting Held December 13, 1991

This meeting was held to address three topics and a fourth topic was briefly discussed.

1. Allowable flow 100-year frequency storm design conveyance systems.

2. Allowable volume.

3. Cost apportionment downstream of ponds.

4. Cost allocation principles for diversions where more than one city contributes flow.

These interpretations use the definitions for watershed, land use, and drainage system set forth in the March 9, 1988 Allowable Flow memorandum. The current memorandum provides an interpretation of the allowable flow for cases where the design is not based on a 10-year storm.

1. Allowable Flow for 100-Year Frequency Storm Design Conveyance Systems

The Joint Powers Agreement, Section 3, Subd. 3, states that the allowable flow is a rate an volume of flow according to the design criteria in Section 8, Subd. 6. Section 8, Subd. 6 provides that detention basins and open channel conveyance systems be designed for a 100-year return frequency storm.

Consistent with these provisions, for drainage systems for which the design criteria are 100-year return frequency precipitation events, the allowable flow shall be computed as a 100-year rate and volume flow.

The allowable rate of flow shall be computed by $Q = CIA$
where:

Q is the allowable flow rate in cubic feet per second.

C is the runoff coefficient, defined to be 0.15.

I is the 100-year return frequency rainfall intensity appropriate to the watershed time of concentrations, in inches per hour.

A is the watershed area in acres.

Excess flow is the 100-year design flow less the 100-year allowable flow.

This approach shall be applied for conveyance systems where the design is governed by 100-year return frequency events. This includes [redacted], detention basin outlets, conveyance systems downstream of detention basins, open channels, and other conveyance that is designed for 100-year return frequency events. Similar logic would apply to any system for which the design criteria was neither 10-year or 100-year. See Example F for an illustration of a 100-year excess flow calculation.

2. Allowable Volume

The allowable volume is the total runoff volume from the design storm, for a watershed with the land use defined in the March 9, 1988 memorandum. Where the ponding in the upstream community is negligible, the allowable volume may be estimated as being in the same proportion to the design volume as the allowable flow is to the design flow.

In general, the allowable volume may be computed with the same techniques used to determine the design volume, provided the technique also accurately calculates the allowable discharge rate.

The excess volume is the difference between design and allowable volume.

Where there is upstream ponding, the volume of those ponds is deducted from the excess volume to the extent the upstream detention reduces the volume needed in downstream ponds. Thus, only the storage in upstream detention basin at the time of peak of the downstream detention basin may be used to reduce the excess volume from the upstream community. For instance, assume the peak elevation at a downstream community pond occurs at 6 hours. Assume the upstream community pond stores 10 acre-feet at its peak at 3 hours, but only 5 acre-feet at 6 hours. The "excess volume" from the upstream community would be reduced by 5 acre-feet to account for the storage. See Example G for an illustration of this case.

3. Cost Apportionment Downstream of Ponds

In the Joint Power Agreement, Exhibit A, page 9 of 9, the formula for adjustment to excess flow as a result of ponding is presented:

$$Q_{excess}(outlet) = Q_{excess}(inlet) \times \frac{Q_{total}(outlet)}{\Sigma\, Q_{total}(inlet)}$$

The proportioning $Q_{total}^{(outlet)}/\Sigma\, Q_{total}^{(inlet)}$ shall be computed on the same return frequency event used for the pond design. If the pond is designed for a 100-year event, the adjustment in excess flow through the pond shall be based on the 100-year outflow and inflow values. Thus, if a 10-year design governs cost sharing for construction downstream of a pond, the 10-year excess flow would be reduced as follows:

$$Q_{excess\ 10\text{-}year\,(outlet)} = Q_{excess\ 10\text{-}year\,(inlet)} \times \frac{Q_{total\ 100\text{-}year\,(outlet)}}{\Sigma\ Q_{total\ 100\text{-}year\,(inlet)}}$$

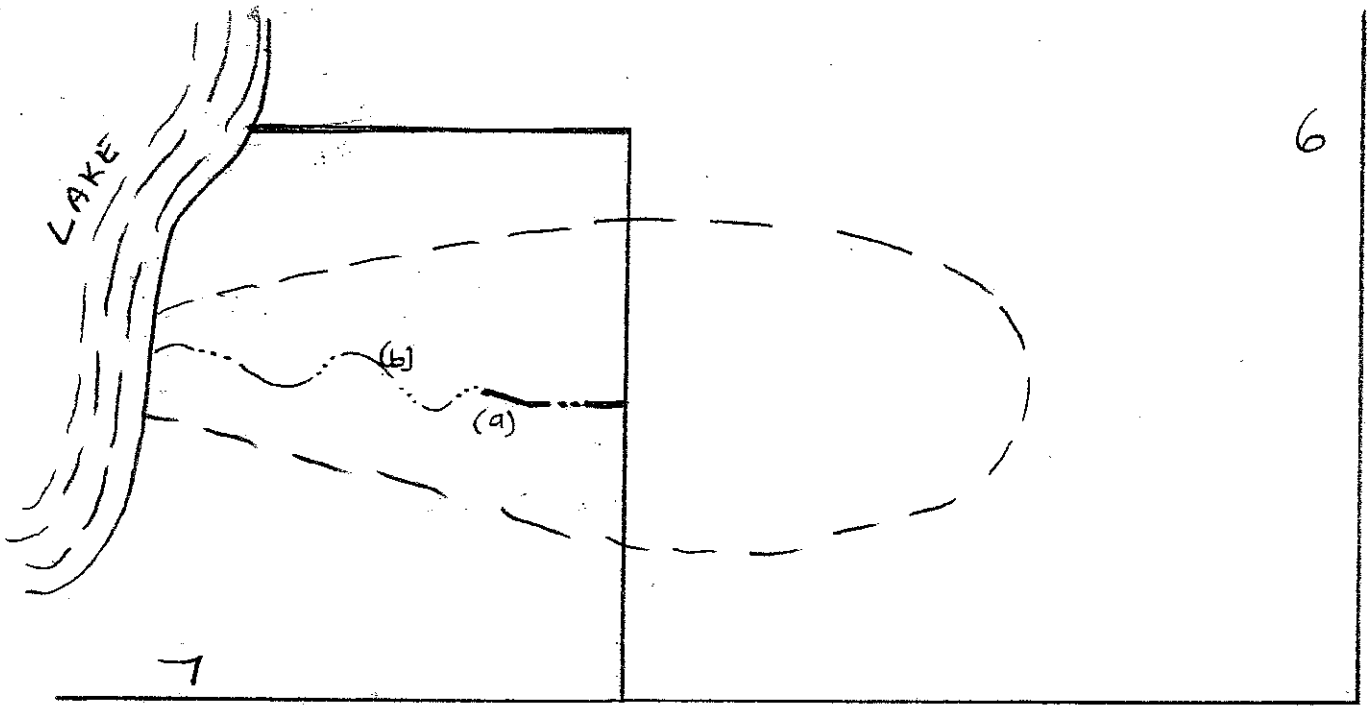
See Example H for an illustration of this case.

4. Cost Allocation Principles for Diversion Where More Than One City Contributes Flow

For diversion of water out of its current watershed, into a watershed to which it did not previously flow, there is no allowable flow associated with the diverted water. Consequently, the excess flow from the diverted area equals the design flow. If more than one city contributes water to the diversion, the excess flow from each community is their portion of the design flow from the diverted area. Thus, the cost allocation proportion for each city is their proportion of the design flow.

The "diversion in" is associated with an equal area of "diversion out" of another watershed. The cities retain their allowable flow in the watershed from which the area was "diverted out." This is illustrated for "diversion out" by one city on Page 6 of 9 of Exhibit A to the Joint Powers Agreement.

This principal was applied to the Lexington Avenue drainage case with Lilydale and Mendota Heights. The situation is illustrated conceptually in Example I.



Example F - Other than 10-year Design

Project: Construct storm sewer "a" and open channel "b" in City #7 to provide drainage for Cities #6 and #7 under fully developed conditions.

Cost Allocation:

City #6 Cost Share: $\frac{Q_{E6-10}}{Q_{D-10}}$ x Total Project Cost for "a"

$\frac{Q_{E6-100}}{Q_{D-100}}$ x Total Project Cost for "b"

Q_{E6-10} = 10 year excess flow from City #6 = $Q_{D6-10} - Q_{A6-10}$

Q_{D6-10} = 10 year design flow from City #6

Q_{A6-10} = 10 year allowable flow from City #6

Q_{D-10} = 10 year design flow for storm sewer "a"

Q_{E6-100} = 100 year excess flow from City #6 = $Q_{D6-100} - Q_{A6-100}$

Q_{D6-100} = 100 year design flow from City #6

Q_{A6-100} = 100 year allowable flow from City #6

Q_{D-100} = 100 year design flow for open channel "b"

Example F- Continued

City #7 Cost Share: Total Project Cost - (City #6 Cost Share)

Sample Calculations

City #6 - Watershed area = 100 acres

Q_{D6-10} = .40 x 2"/hr x 100 = 80 cfs

Q_{A6-10} = .15 x 2"/hr x 100 = 30 cfs

Q_{E6-10} = 80 - 30 = 50 cfs

1. City #6 cost share for storm sewer "a" = $\frac{50\text{ cfs}}{80\text{ cfs}}$ x "a" Project Cost =

= 0.625 x "a" Project Cost

2. City #6 cost share for open channel "b":

Q_{D6-100} = .40 x 4"/hr x 100 = 160 cfs

Q_{A6-100} = .15 x 4"/hr x 100 = 60 cfs

Q_{E6-100} = 160 - 60 = 100 cfs

Assume Q_{D-100} for channel "b" = 200 cfs

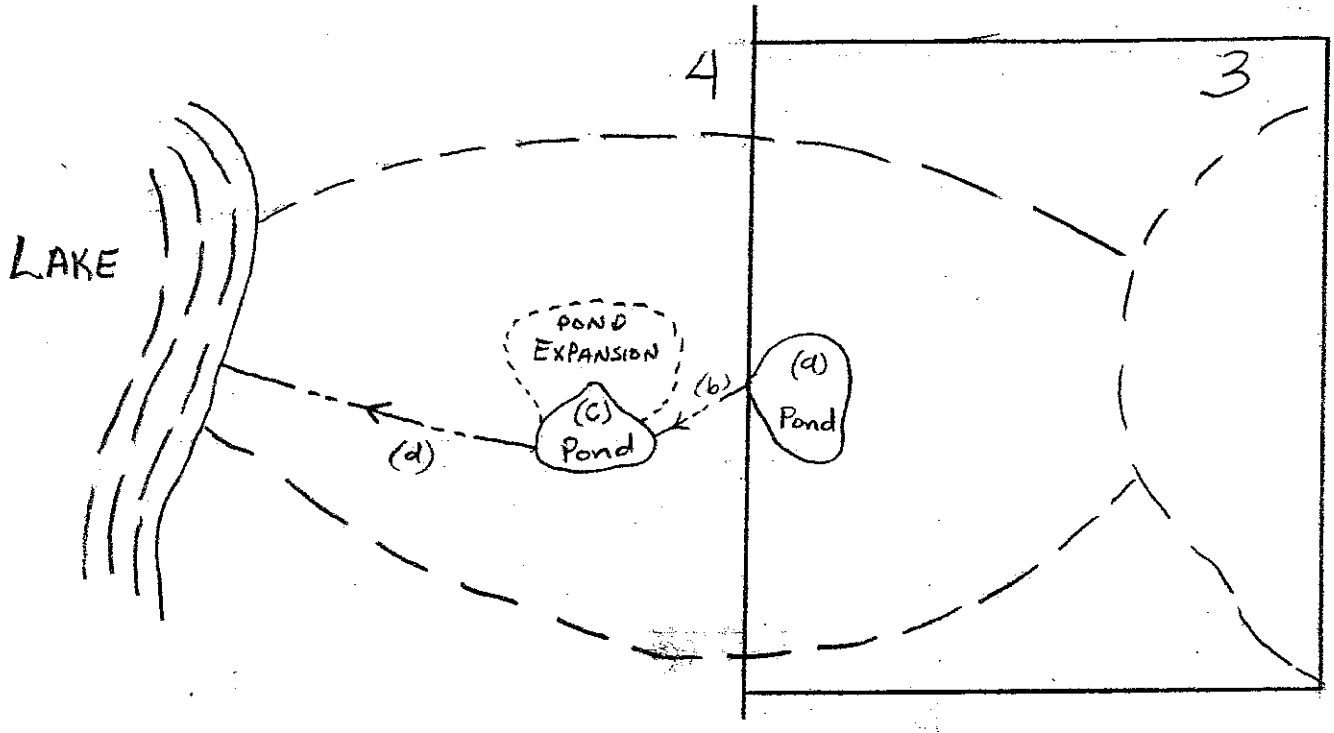
City #6 cost share = $\frac{100\text{ cfs}}{200\text{ cfs}}$ x "b" Project Cost

= 0.5 x "b" Project Cost

Summary of Costs:

Segment "a" (10 year design)	City #6 Cost Share =	0.625 x Project Cost for "a"
	City #7 Cost Share =	0.375 x Project Cost for "a"
Segment "b" (100 year design)	City #6 Cost Share =	0.5 x Project Cost for "b"
	City #7 Cost Share =	0.5 x Project Cost for "b"

EXAMPLE G



EXAMPLE G : ALLOWABLE VOLUME

Pond "c" is to be expanded from a 10 acre-foot (AF) storage capacity to a 50 AF storage capacity detention basin. The critical design storm for Pond "c" will be the 6-hour 100 year return frequency rainfall.

Background & Assumptions:

$Q_{D_b\text{-}100}$ = Design flow (100 year) in segment b = 50 cfs

$Q_{A_3\text{-}100}$ = Allowable flow (100 year) from City #3 = 60 cfs
i.e. .15 x 4 in/hr x 100 acres = 60 cfs

$Q_{E_3\text{-}100}$ = Excess flow (100 year) from City #3

$= Q_{D_{6\text{-}100}} - Q_{A_3\text{-}100} = 50 - 60 = -10$ cfs

(conveyance system)

Therefore there is no excess flow from City #3, and City #3 does not participate financially in conveyance system improvements and maintenance in the downstream community, City #4.

City #3 may nevertheless be obligated to share in

EXAMPLE "G" continued

the Pond expansion costs, & maintenance costs of entire Pond

Excess Volume Calculation

$$V_{E_3} = V_{D_3} - V_{A_3} - V_{P_3}$$

V_{E_3} = Excess volume, from City #3, for the Pond "c" critical design storm (i.e. 100year-6 hour storm)

V_{D_3} = Design volume of runoff from City #3 for the Pond "c" critical design storm.

V_{A_3} = Allowable volume of runoff from City #3 for the Pond "c" critical design storm.

V_{P_3} = Volume of runoff stored in ponds in City #3 at the time of the peak volume stored in Pond "c" for the Pond "c" critical design storm.

Assume:

V_{D_3} = 75 AF

V_{A_3} = 35 AF

V_{P_3} = 10 AF. Say Pond "a" was designed to store 30 AF for its critical storm - a 1-hour 100 year storm. But, say the time of peak at Pond "c" is 6 hours later, so only 10 AF remains stored in Pond "a" at the time of peak in Pond "c".

$$V_{E_3} = 75\,AF - 35\,AF - 10\,AF = 30\,AF$$

Thus, although there is no excess flow (flowrate) from City #3, there is excess volume from City #3.

The allowable volume should be calculated using the same methodology as used to calculate the design volume, but the land use should be converted to 100% turf or pasture in good condition.

Example "C" continued

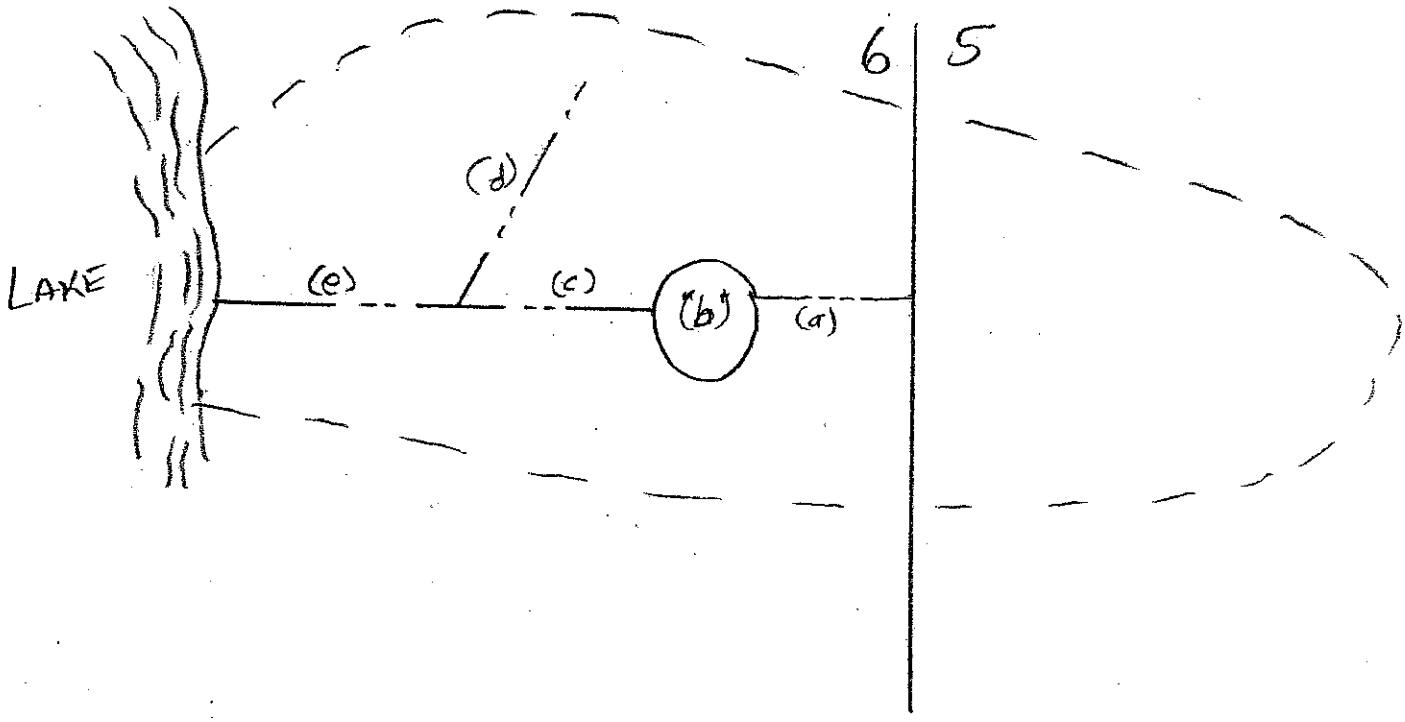
COST ALLOCATION

Cost share for Pond "c" expansion:

City #3 cost share: $\frac{V_{E_3}}{V_T}$ x Project Cost for Pond "c" expansion

where V_T = the design increase in storage volume of Pond "c" for the critical storm. Note- this does not include the former design volume of the pond. The former design volume of the pond (before expansion) should be computed as the volume of detention storage below the 'design level' for the former pond, for the Pond "c" expansion design storm at the time of peak for the Pond "c" expansion.

For instance, say former Pond "C" was designed for a 25-year storm, and held 10 AF. But in the 6-hour-100year design storm, the pond would overtop, cause flooding, and the storage at the pond and surrounding area would be 15 AF. Only the 10AF design volume is counted as the "former design volume" for V_T.



EXAMPLE H

Refer to Example E of the Joint Powers Agreement

Assume

Pond "b" reduces outflow to 10% of inflow.

i.e. $\frac{Q_T \text{ (outlet) } 100\text{year}}{\Sigma Q_T \text{ (inlet) } 100\text{year}} = 0.1$

$Q_{E_5\text{-}100}$ = 100-year excess flow from City #5 = 100cfs

$Q_{E_5\text{-}10}$ = 10-year excess flow from City #5 = 70cfs

Then, for segments "c" and "e":

c: 100 year design: $Q_{E_5\text{-}100} = 100 \times .1 = 10$ cfs

e: 10 year design: $Q_{E_5\text{-}10} = 70 \times .1 = 7$ cfs

Assume

$Q_{D_{100}}$ for segment c = 50 cfs

$Q_{D_{10}}$ for segment e = 70 cfs

EXAMPLE H continued

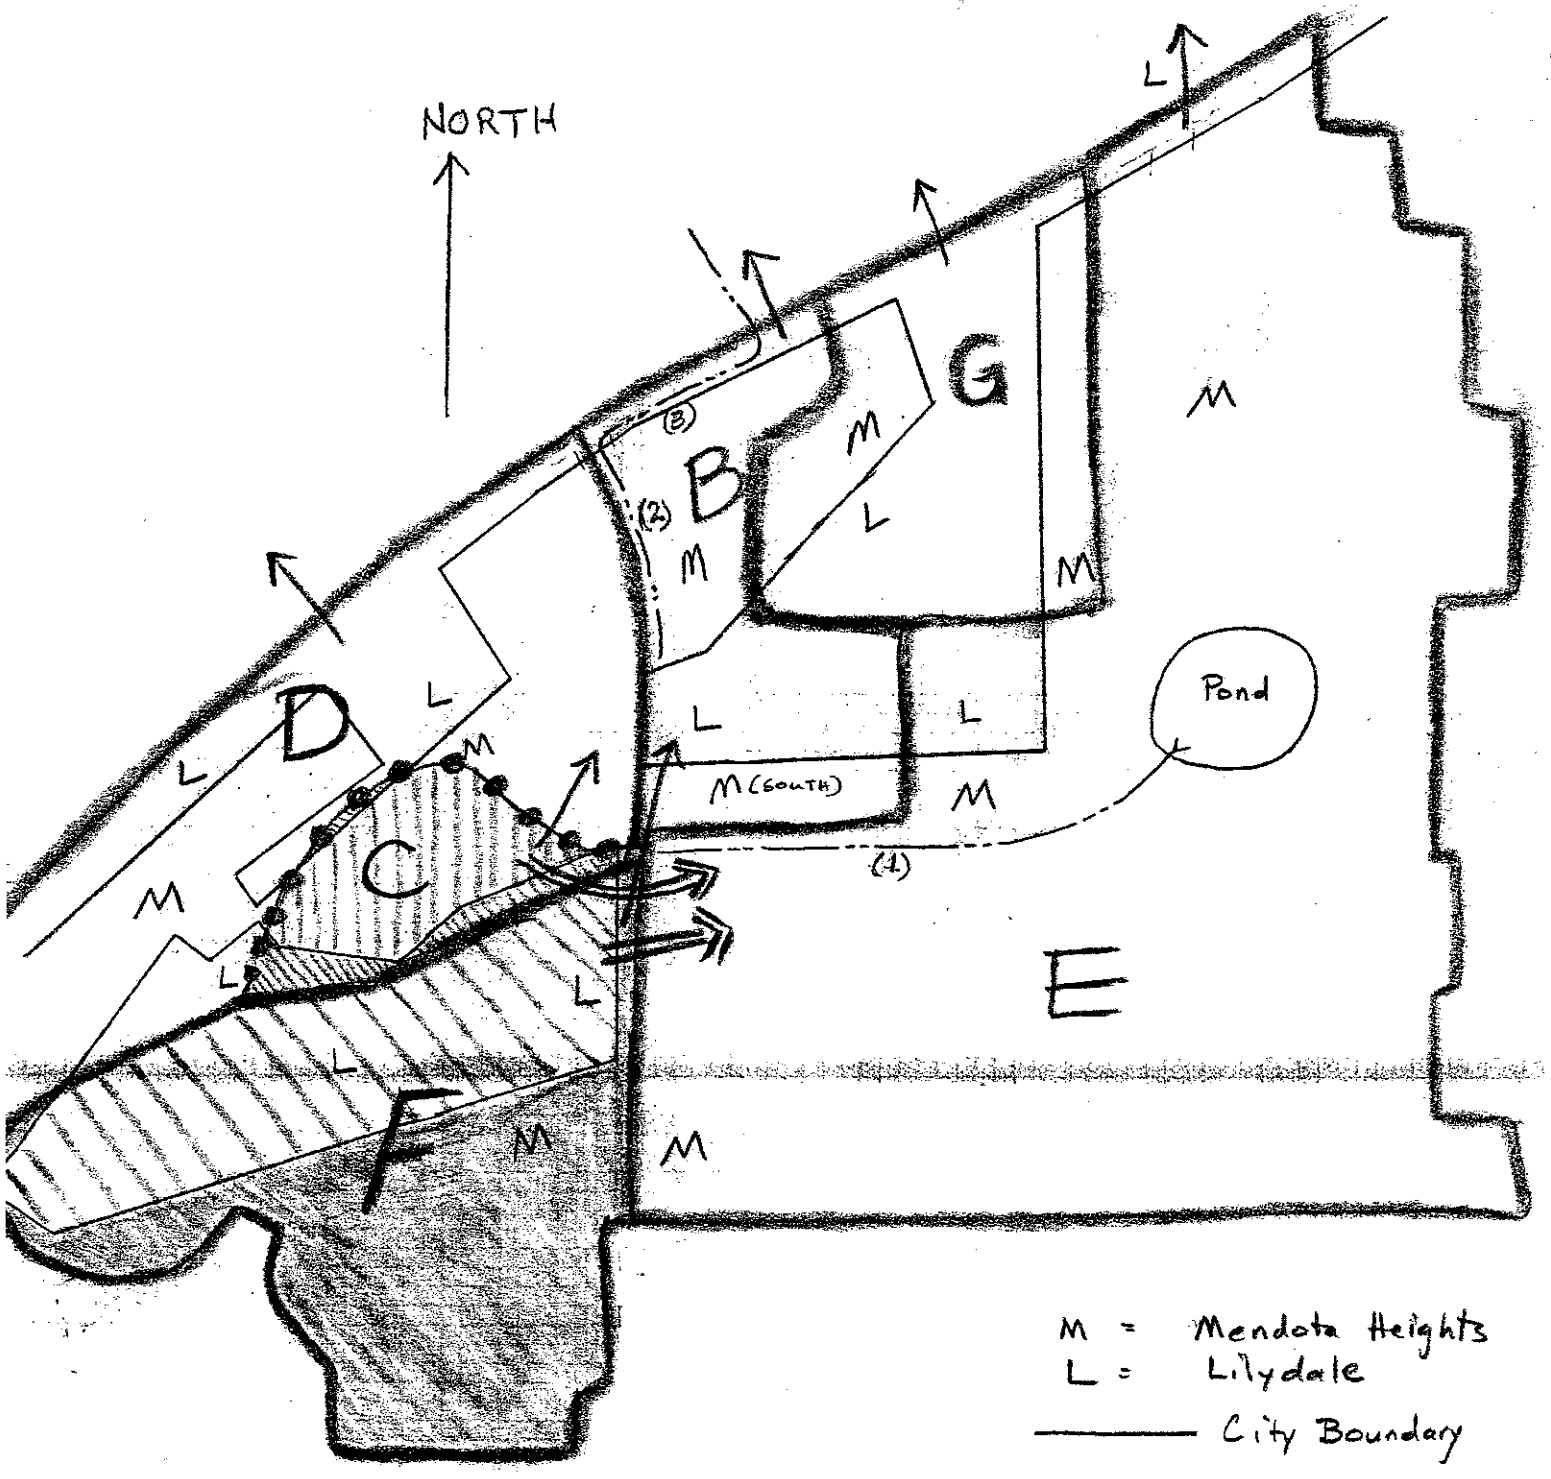
COST ALLOCATION

Segment "c", City #5 cost share = $\frac{10\,cfs}{50\,cfs}$ x Segment "c" Project Cost

= 0.20 x Segment "c" Project Cost

Segment "e", City #5 cost Share = $\frac{7\,cfs}{70\,cfs}$ x Segment "e" ProjectCost

= 0.10 x Segment "e" ProjectCost



M = Mendota Heights
L = Lilydale

——— City Boundary

Principal Watershed Divide

New Principal Watershed Divide as a result of Diversion

→ Original Flow Pattern

EXAMPLE "I" ⇒ Changed Flow Pattern as a result of

Portions of Lilydale diverted from B to E

Portions of Lilydale diverted from D to E

Portions of Mendota Heights diverted from B to E

Portions of Mendota Heights diverted from D to E

COST ALLOCATIONS, Segment "1" in Watershed E

Segment "1" serves Area C and Area F, which have been diverted into Area E. Because this is a diversion, there is no allowable flow attributable to any of Areas C or F diverted into Area E. The cost allocations for Segment "1" are in proportion to the flow contributions from the 2 communities from Areas C and F.

Q_{D_1} = design flow for segment "1" from Area C plus Area F.

$Q_{D_{1_L}}$ = design flow from Lilydale in Area C plus Area F.

$Q_{D_{1_M}}$ = design flow from Mendota Heights in Area C plus Area F.

$$\text{Lilydale Cost Share} = \frac{Q_{D_{1_L}}}{Q_{D_1}} \times \text{Project Cost for Segment "1"}$$

$$\text{Mendota Heights Cost Share} = \frac{Q_{D_{1_M}}}{Q_{D_1}} \times \text{Project Cost for Segment "1"}$$

COST ALLOCATIONS, Segment "2" in Watershed B

Area F (but not Area C) has been diverted out of Area B and into Area E. The allowable flow from Area F is still counted for cost allocation in Area B and the watersheds downstream of Area B. In addition, portions of both Mendota Heights and Lilydale contribute to Segment "2". Segment "2" is considered to be constructed entirely in Mendota Heights.

Q_{D_2} = design flow for segment "2"

$Q_{D_{M_S}}$ = design flow from the portion of Mendota Heights labeled "M (south)" in Area B

Q_{A_L} = allowable flow for Lilydale for segment "2"

Q_{E_L} = excess flow for Lilydale for segment "2"

EXAMPLE "I" continued

$Q_{E_L} = Q_{D_2} - Q_{D_{M_S}} - Q_{A_L}$

$Q_{A_L} = Q_{A_{F_L}} + Q_{A_{B_L}}$

$Q_{A_{F_L}}$ = allowable flow for that portion of Area F which is Lilydale.

$Q_{A_{B_L}}$ = allowable flow for that portion of Area B which is Lilydale

Assume: $Q_{D_2} = 20$ cfs

$Q_{D_{M_S}} = 6$ cfs

$Q_{A_{F_L}} = 12$ cfs

$Q_{A_{B_L}} = 6$ cfs

$Q_{E_L} = 20_{cfs} - 6\,cfs - (12\,cfs + 6\,cfs) = -4\,cfs$

Thus Lilydale has no excess flow in Segment "2".

Lilydale Cost Share = Zero Dollar.

Mendota Heights Cost Share = 100% of Project Cost for Segment "2".

(note - these are assumed values. The analysis of the actual case may lead to other conclusions.)

COST ALLOCATION, Segment "3" in Watershed B (and immediately downstream of Watershed B).

This case is similar to the cost allocation for Segment "2", except that Mendota Heights has an allowable flow, since segment "3" is constructed in Lilydale.

Q_{D_3} = design flow for segment "3",

Q_{D_L} = design flow for the portion of Lilydale in Area B.

Q_{A_M} = allowable flow for Mendota Heights for segment "3".

Q_{E_M} = excess flow for Mendota Heights for segment "3".

EXAMPLE "I" continued

$$Q_{E_m} = Q_{D_3} - Q_{D_L} - Q_{A_m}$$

$$Q_{A_m} = Q_{A_{F_m}} + Q_{A_{B_m}}$$

$Q_{A_{F_m}}$ = allowable flow for that portion of Area F which is Mendota Heights

$Q_{A_{B_m}}$ = allowable flow for that portion of Area B which is Mendota Heights

Assume:

$Q_{D_3} = 40$ cfs

$Q_{D_L} = 14$ cfs

$Q_{A_{F_M}} = 15$ cfs

$Q_{A_{B_m}} = 10$ cfs

Then:

$$Q_{A_M} = 15\text{cfs} + 10\text{cfs} = 25\text{cfs}$$

$$Q_{E_m} = 40\text{cfs} - 14\text{cfs} - 25\text{cfs} = 1\text{cfs}$$

$$\text{Lilydale Cost Share} = \frac{Q_{D_3} - Q_{E_M}}{Q_{D_3}} \times \text{Project Cost for Segment "3"}$$

$$= \frac{40-1}{40} \times \text{Cost} = \frac{39}{40} \times \text{Project Cost, Seg. "3"}$$

$$\text{Mendota Heights Cost Share} = \frac{Q_{E_M}}{Q_{D_3}} \times \text{Project Cost for Segment "3"}$$

$$= \frac{1}{40} \times \text{Project Cost for Segment "3"}.$$

(note - these are assumed values. The analysis of the actual case may lead to other conclusions)

M = Community M
L = Community L
X = Excess Flow
A = Allowable Flow

Section S: $M_S = C_S\left(\frac{X_{m1} + X_{m2}}{D_S}\right)$ $\quad L_S = C_S\left(\frac{D_S - X_{m1} - X_{m2}}{D_S}\right)$

MEMORANDUM

TO: Lower Mississippi River Watershed Management Organization

FROM: James R. Langseth

DATE: June 12, 1992

RE: Allowable Flow, Summary of Understanding Based on the Discussions at the Meetings Held December 13, 1991 and May 15, 1992

These meetings addressed four topics.

1. Allowable flow for conveyance systems designed for 100-year frequency storms.

2. Allowable volume.

3. Cost apportionment downstream of ponds (detention basins).

4. Cost allocation principles for diversions where more than one city contributes flow.

These interpretations use the definitions for watershed, land use, and drainage system set forth in the March 9, 1988 Allowable Flow memorandum. The current memorandum provides an interpretation of the allowable flow for cases where the design is not based on a 10-year storm, as well as amplifying the principles to be used for diversion of drainage.

1. Allowable Flow for 100-Year Frequency Storm Design Conveyance Systems

The Joint Powers Agreement, Section 3, Subd. 3, states that the allowable flow is a rate an volume of flow according to the design criteria in Section 8, Subd. 6. Section 8, Subd. 6 provides that detention basins and open channel conveyance systems be designed for a 100-year return frequency storm.

Consistent with these provisions, for drainage systems for which the design criteria are 100-year return frequency precipitation events, the allowable flow shall be computed as a 100-year rate and volume flow.

The allowable rate of flow shall be computed by $Q = CIA$
where:

Q is the allowable flow rate in cubic feet per second.

C is the runoff coefficient, defined to be 0.15.

I is the 100-year return frequency rainfall intensity appropriate to the watershed time of concentrations, in inches per hour.

A is the watershed area in acres.

Excess flow is the 100-year design flow less the 100-year allowable flow.

This approach shall be applied for conveyance systems where the design is governed by 100-year return frequency events. This includes detention basin outlets, conveyance systems downstream of detention basins, open channels, and other conveyance that is designed for 100-year return frequency events. Similar logic would apply to any system for which the design criteria was neither 10-year or 100-year. See Example F for an illustration of a 100-year excess flow calculation.

2. Allowable Volume

The allowable volume is the total runoff volume from the design storm, for a watershed with the land use defined in the March 9, 1988 memorandum. Where the ponding in the upstream community is negligible, the allowable volume may be estimated as being in the same proportion to the design volume as the allowable flow is to the design flow.

In general, the allowable volume may be computed with the same techniques used to determine the design volume, provided the technique also accurately calculates the allowable discharge rate.

The excess volume is the difference between design and allowable volume.

Where there is upstream ponding, the volume of those ponds is deducted from the excess volume to the extent the upstream detention reduces the volume needed in downstream ponds. Thus, only the storage in upstream detention basins at the time of peak of the downstream detention basin may be used to reduce the excess volume from the upstream community. For instance, assume the peak elevation at a downstream community pond occurs at 6 hours. Assume the upstream community pond stores 10 acre-feet at its peak at 3 hours, but only 5 acre-feet at 6 hours. The "excess volume" from the upstream community would be reduced by 5 acre-feet to account for the storage. See Example G for an illustration of this case.

3. Cost Apportionment Downstream of Ponds

In the Joint Power Agreement, Exhibit A, page 9 of 9, the formula for adjustment of excess flow as a result of ponding is presented:

$$Q_{excess}(\text{outlet}) = Q_{excess}(\text{inlet}) \times \frac{Q_{total}(\text{outlet})}{\Sigma\, Q_{total}(\text{inlet})}$$

The proportioning $Q_{total}(\text{outlet})/\Sigma\, Q_{total}(\text{inlet})$ shall be computed on the same return frequency event used for the pond design. If the pond is designed for a 100-year event, the adjustment in excess flow through the pond shall be based on the 100-year outflow and inflow values. Thus, if a 10-year design governs cost sharing for construction downstream of a pond, the 10-year excess flow would be reduced as follows:

$$Q_{excess\ 10\text{-}year\,(outlet)} = Q_{excess\ 10\text{-}year\,(inlet)} \times \frac{Q_{total\ 100\text{-}year\,(outlet)}}{\Sigma\ Q_{total\ 100\text{-}year\,(inlet)}}$$

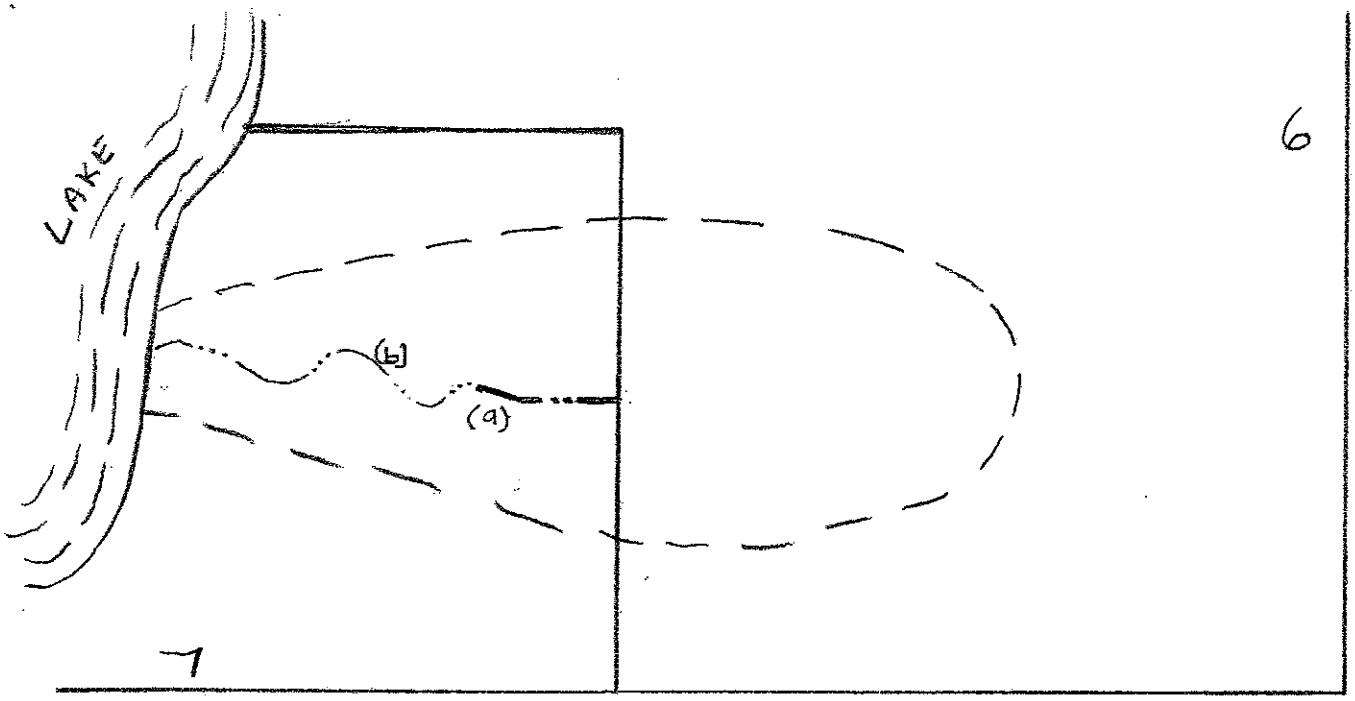
See Example H for an illustration of this case.

4. Cost Allocation Principles for Diversion Where More Than One City Contributes Flow

For diversion of water out of its current watershed, into a watershed to which it did not previously flow, there is no allowable flow associated with the diverted water. Consequently, the excess flow from the diverted area equals the design flow. If more than one city contributes water to the diversion, the excess flow from each community is their portion of the design flow from the diverted area. Thus, the cost allocation proportion for each city is their proportion of the design flow.

The "diversion in" is associated with an equal area of "diversion out" of another watershed. The cities retain their allowable flow in the watershed from which the area was "diverted out." This is illustrated for "diversion out" by one city on Page 6 of 9 of Exhibit A to the Joint Powers Agreement.

This principal was applied to the Lexington Avenue drainage case with Lilydale and Mendota Heights. The situation is illustrated conceptually in Example I.



Example F - Other than 10-year Design

Project: Construct storm sewer "a" and open channel "b" in City #7 to provide drainage for Cities #6 and #7 under fully developed conditions.

Cost Allocation:

City #6 Cost Share: $\frac{Q_{E6-10}}{Q_{D-10}}$ x Total Project Cost for "a"

$\frac{Q_{E6-100}}{Q_{D-100}}$ x Total Project Cost for "b"

Q_{E6-10} = 10 year excess flow from City #6 = $Q_{D6-10} - Q_{A6-10}$

Q_{D6-10} = 10 year design flow from City #6

Q_{A6-10} = 10 year allowable flow from City #6

Q_{D-10} = 10 year design flow for storm sewer "a"

Q_{E6-100} = 100 year excess flow from City #6 = $Q_{D6-100} - Q_{A6-100}$

Q_{D6-100} = 100 year design flow from City #6

Q_{A6-100} = 100 year allowable flow from City #6

Q_{D-100} = 100 year design flow for open channel "b"

City #7 Cost Share: Total Project Cost - (City #6 Cost Share)

Sample Calculations

City #6 - Watershed area = 100 acres

Q_{D6-10} = .40 x 2"/hr x 100 = 80 cfs

Q_{A6-10} = .15 x 2"/hr x 100 = 30 cfs

Q_{E6-10} = 80-30 = 50 cfs

1. City #6 cost share for storm sewer "a" = $\frac{50 \text{ cfs}}{80 \text{ cfs}}$ x "a" Project Cost =

= 0.625 x "a" Project Cost.

2. City #6 cost share for open channel "b":

Q_{D6-100} = .40 x 4"/hr x 100 = 160 cfs

Q_{A6-100} = .15 x 4"/hr x 100 = 60 cfs

Q_{E6-100} = 160 - 60 = 100 cfs

Assume Q_{D-100} for channel "b" = 200 cfs

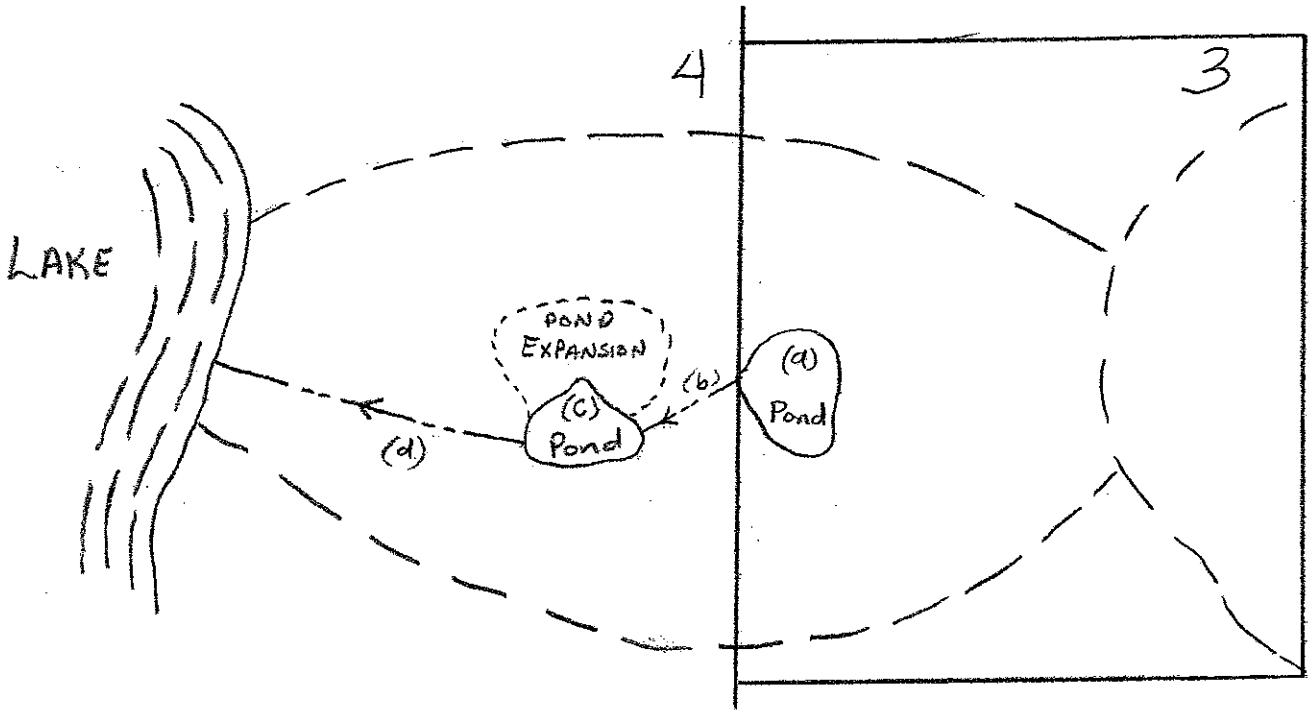
City #6 cost share = $\frac{100 \text{ cfs}}{200 \text{ cfs}}$ x "b" Project Cost

= 0.5 x "b" Project Cost

Summary of Costs:

Segment "a" (10 year design)	City #6 Cost Share =	0.625 x Project Cost for "a"
	City #7 Cost Share =	0.375 x Project Cost for "a"
Segment "b" (100 year design)	City #6 Cost Share =	0.5 x Project Cost for "b"
	City #7 Cost Share =	0.5 x Project Cost for "b"

EXAMPLE G



EXAMPLE G : ALLOWABLE VOLUME

Pond "c" is to be expanded from a 10 acre-foot (AF) storage capacity to a 50 AF storage capacity detention basin. The critical design storm for Pond "c" will be the 6-hour 100 year return frequency rainfall.

Background & Assumptions:

$Q_{D_b\text{-}100}$ = Design flow (100 year) in segment b = 50 cfs

$Q_{A_3\text{-}100}$ = Allowable flow (100 year) from City #3 = 60 cfs
i.e. .15 x 4 in/hr x 100 acres = 60 cfs

$Q_{E_3\text{-}100}$ = Excess flow (100 year) from City #3

$= Q_{D_6\text{-}100} - Q_{A_3\text{-}100} = 50 - 60 = -10$ cfs

Therefore there is no excess flow from City #3, and City #3 does not participate financially in conveyance system improvements or conveyance system maintenance in the downstream community, City #4.

City #3 may nevertheless be obligated to share in

EXAMPLE "G" continued

the Pond expansion costs and maintenance costs of the pond expansion (not of the whole pond).

Excess Volume Calculation

$$V_{E_3} = V_{D_3} - V_{A_3} - V_{P_3}$$

V_{E_3} = Excess volume, from City #3, for the Pond "c" critical design storm (i.e. 100year-6 hour storm)

V_{D_3} = Design volume of runoff from City #3 for the Pond "c" critical design storm.

V_{A_3} = Allowable volume of runoff from City #3 for the Pond "c" critical design storm.

V_{P_3} = Volume of runoff stored in ponds in City #3 at the time of the peak volume stored in Pond "c" for the Pond "c" critical design storm.

Assume:

V_{D_3} = 75 AF

V_{A_3} = 35 AF

V_{P_3} = 10 AF. Say Pond "a" was designed to store 30 AF for its critical storm - a 1-hour 100 year storm. But, say the time of peak at Pond "c" is 6 hours later, so only 10 AF remains stored in Pond "a" at the time of peak in Pond "c".

$$V_{E_3} = 75\,AF - 35\,AF - 10\,AF = 30\,AF$$

Thus, although there is no excess flow (flowrate) from City #3, there is excess volume from City #3.

The allowable volume should be calculated using the same methodology as used to calculate the design volume, but the land use should be converted to 100% turf or pasture in good condition.

COST ALLOCATION

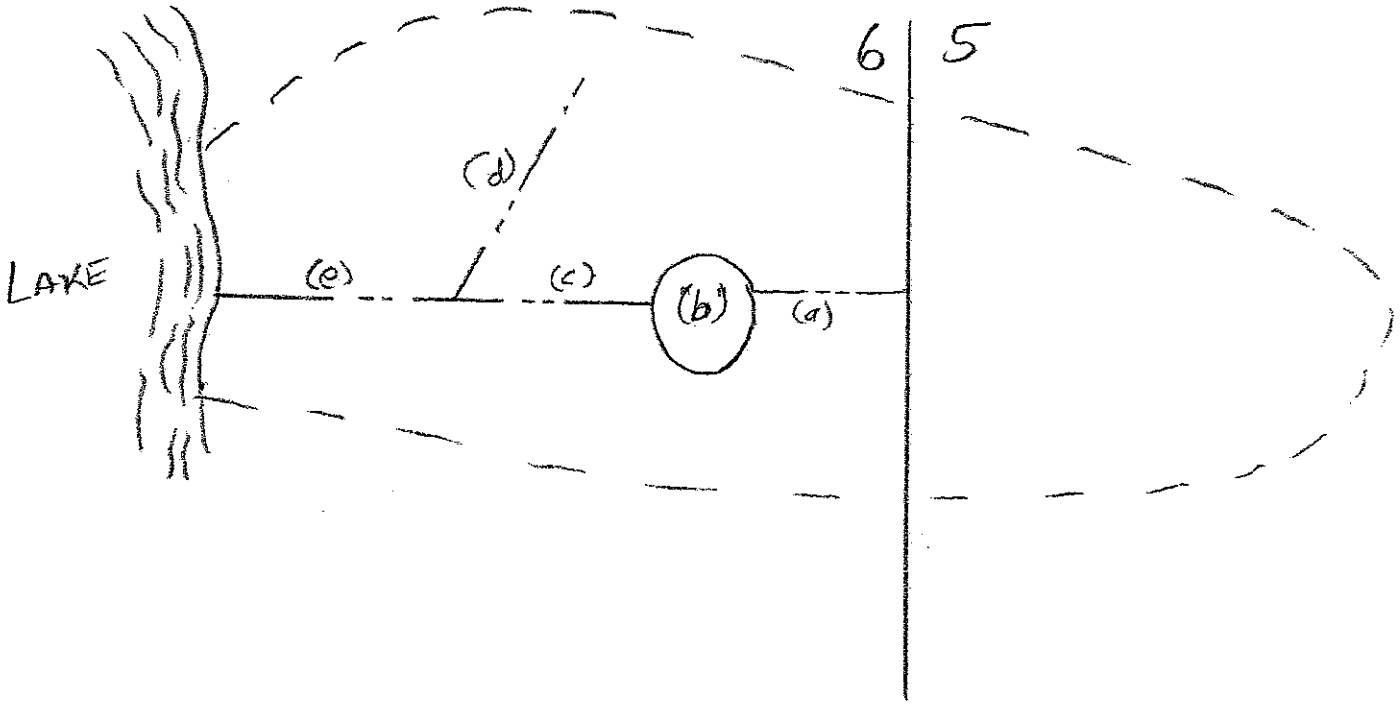
Cost share for Pond "c" expansion.

City #3 cost share : $\frac{V_{E_3}}{V_T}$ x Project Cost for Pond "c" expansion

where V_T = the design increase in storage volume of Pond "c" for the critical storm. Note- this does not include the former design volume of the pond. The former design volume of the pond (before expansion) should be computed as the volume of detention storage below the 'design level' for the former pond, for the Pond "c" expansion design storm at the time of peak for the Pond "c" expansion.

For instance, say former Pond "C" was designed for a 25-year storm, and held 10 AF. But in the 6-hour-100year design storm, the pond would overtop, cause flooding, and the storage at the pond and surrounding area would be 15 AF. Only the 10AF design volume is counted as the "former design volume" for V_T.

Note that for maintenance costs, the City #3 share applies only to the pond expansion, not to maintenance of the whole pond.



EXAMPLE H

Refer to Example E of the Joint Powers Agreement

Assume

Pond "b" reduces outflow to 10% of inflow.

i.e. $\frac{Q_T \text{ (outlet) } 100\text{year}}{\Sigma Q_T \text{ (inlet) } 100\text{year}} = 0.1$

$Q_{E_5\text{-}100}$ = 100-year excess flow from City #5 = 100cfs

$Q_{E_5\text{-}10}$ = 10-year excess flow from City #5 = 70cfs

Then, for segments "c" and "e":

c: 100 year design: $Q_{E_5\text{-}100} = 100 \times .1 = 10$ cfs

e: 10 year design: $Q_{E_5\text{-}10} = 70 \times .1 = 7$ cfs

Assume

$Q_{D_{100}}$ for segment c = 50 cfs

$Q_{D_{10}}$ for segment e = 70 cfs

EXAMPLE H continued

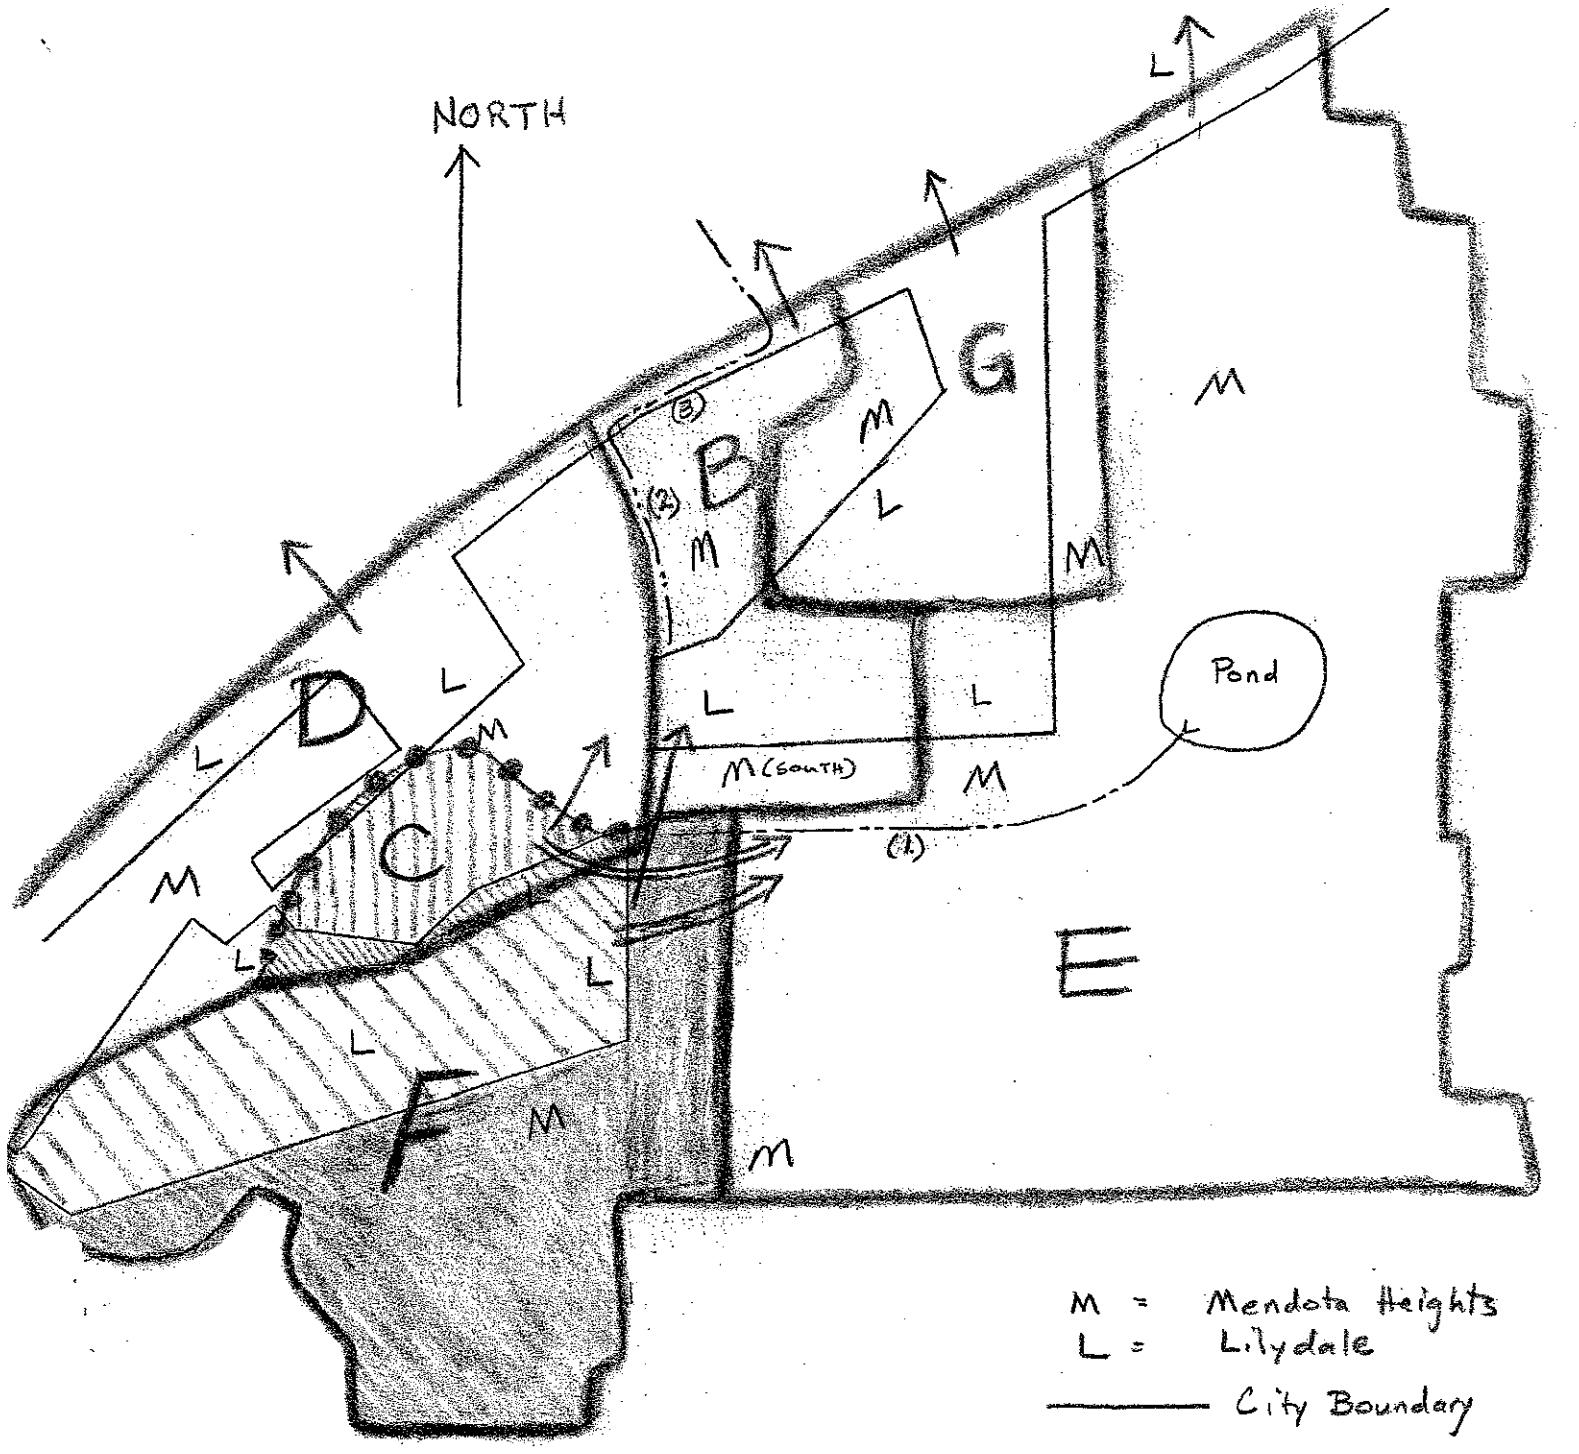
COST ALLOCATION

Segment "c", City #5 cost share = $\frac{10\,cfs}{50\,cfs}$ x Segment "c" Project Cost

= 0.20 x Segment "c" Project Cost

Segment "e", City #5 cost Share = $\frac{7\,cfs}{70\,cfs}$ x Segment "e" Project Cost

= 0.10 x Segment "e" Project Cost



M = Mendota Heights
L = Lilydale

——— City Boundary

Principal Watershed Divide

New Principal Watershed Divide as a result of Diversion

→ Original Flow Pattern

EXAMPLE "I" ⇒ Changed Flow Pattern as a result of Diversion

Portions of Lilydale diverted from B to E

Portions of Lilydale diverted from D to E

Portions of Mendota Heights diverted from B to E

Portions of Mendota Heights diverted from D to E

COST ALLOCATIONS, Segment '(1)' in Watershed E

Segment '(1)' serves Area C and Area F, which have been diverted into Area E. Because this is a diversion, there is no allowable flow attributable to any of Areas C or F diverted into Area E. The cost allocations for Segment '(1)' are in proportion to the flow contributions from the 2 communities from Areas C and F.

Q_{D_1} = design flow for segment '(1)' from Area C plus Area F.

$Q_{D_{1_L}}$ = design flow from Lilydale in Area C plus Area F.

$Q_{D_{1_M}}$ = design flow from Mendota Heights in Area C plus Area F.

$$\text{Lilydale Cost Share} = \frac{Q_{D_{1_L}}}{Q_{D_1}} \times \text{Project Cost for Segment '(1)'}$$

$$\text{Mendota Heights Cost Share} = \frac{Q_{D_{1_M}}}{Q_{D_1}} \times \text{Project Cost for Segment '(1)'}$$

COST ALLOCATIONS, Segment '(2)' in Watershed B

Area F (but not Area C) has been diverted out of Area B and into Area E. The allowable flow from Area F is still counted for cost allocation in Area B and the watersheds downstream of Area B. In addition, portions of both Mendota Heights and Lilydale contribute to Segment '(2)'. Segment '(2)' is considered to be constructed entirely in Mendota Heights.

Q_{D_2} = design flow for segment "2"

$Q_{D_{M_S}}$ = design flow from the portion of Mendota Heights labeled "M (south)" in Area B

Q_{A_L} = allowable flow for Lilydale for segment "2"

Q_{E_L} = excess flow for Lilydale for segment "2"

EXAMPLE "I" continued

$$Q_{E_L} = Q_{D_2} - Q_{D_{M_S}} - Q_{A_L}$$

$$Q_{A_L} = Q_{A_{F_L}} + Q_{A_{B_L}}$$

$Q_{A_{F_L}}$ = allowable flow for that portion of Area F which is Lilydale.

$Q_{A_{B_L}}$ = allowable flow for that portion of Area B which is Lilydale

Assume: $Q_{D_2} = 20$ cfs

$Q_{D_{M_S}} = 6$ cfs

$Q_{A_{F_L}} = 12$ cfs

$Q_{A_{B_L}} = 6$ cfs

$$Q_{E_L} = 20_{cfs} - 6\,cfs - (12\,cfs + 6\,cfs) = -4\,cfs$$

Thus Lilydale has no excess flow in Segment '(2)'.

Lilydale Cost Share = Zero Dollar.

Mendota Heights Cost Share = 100% of Project Cost for Segment '(2)'.

(note - these are assumed values. The analysis of the actual case may lead to other conclusions.)

COST ALLOCATION, Segment '(3)' in Watershed B (and immediately downstream of Watershed B).

This case is similar to the cost allocation for Segment '(2)', except that Mendota Heights has an allowable flow, since segment '(3)' is constructed in Lilydale.

Q_{D_3} = design flow for segment '(3)'.

Q_{D_L} = design flow for the portion of Lilydale in Area B.

Q_{A_M} = allowable flow for Mendota Heights for segment '(3)'.

Q_{E_M} = excess flow for Mendota Heights for segment '(3)'.

EXAMPLE "I" continued

$$Q_{E_m} = Q_{D_3} - Q_{D_L} - Q_{A_m}$$

$$Q_{A_m} = Q_{A_{F_m}} + Q_{A_{B_m}}$$

$Q_{A_{F_m}}$ = allowable flow for that portion of Area F which is Mendota Heights

$Q_{A_{B_m}}$ = allowable flow for that portion of Area B which is Mendota Heights

Assume:

$Q_{D_3} = 40$ cfs

$Q_{D_L} = 14$ cfs

$Q_{A_{F_m}} = 15$ cfs

$Q_{A_{B_m}} = 10$ cfs

Then:

$$Q_{A_m} = 15\text{cfs} + 10\text{cfs} = 25\text{cfs}$$

$$Q_{E_m} = 40\text{cfs} - 14\text{cfs} - 25\text{cfs} = 1\text{cfs}$$

$$\text{Lilydale Cost Share} = \frac{Q_{D_3} - Q_{E_m}}{Q_{D_3}} \times \text{Project Cost for Segment '(3)'}$$

$$= \frac{40-1}{40} \times \text{Cost} = \frac{39}{40} \times \text{Project Cost, Seg. '(3)'}$$

$$\text{Mendota Heights Cost Share} = \frac{Q_{E_m}}{Q_{D_3}} \times \text{Project Cost for Segment '(3)'}$$

$$= \frac{1}{40} \times \text{Project Cost for Segment '(3)'}.$$

(note - these are assumed values. The analysis of the actual case may lead to other conclusions)

The attached sheet, Appendix A, presents cost allocation for the case of no diversion, but flow re-entering communities after it has once left them.

APPENDIX E

WATER QUALITY MONITORING INFORMATION

Sunfish Lake [Sunfish Lake] (19-0050) *City of Sunfish Lake*

Sunfish Lake is located in the City of Sunfish Lake (Dakota County). The lake has a surface area of 49 acres and a maximum depth of 9.8 m (32 ft).

During each sampling event the lake was monitored for total phosphorus (TP), chlorophyll-a (CLA), and total kjeldahl nitrogen (TKN), and Secchi transparency, as well as the lake's perceived physical condition and recreational suitability.

2009 summer (May-September) data summary

Parameter	*Mean*	*Minimum*	*Maximum*	*Grade*
TP (µg/l)	24.6	12.0	36.0	B
CLA (µg/l)	13.3	1.6	43.0	B
Secchi (m)	2.6	1.1	5.5	B
TKN (mg/l)	0.78	0.58	1.00	
			Lake Grade	B

The lake received a lake grade of B for 2009, which is the best lake grade yet received in its limited monitoring history. Additional years of monitoring are suggested for continuing to build the water quality database so as to better understand the lake's water quality and determine potential water quality trends.

Throughout the monitoring period, the volunteer's opinions of the lake's physical condition and recreational suitability were ranked on a 1-to-5 scale. These user perception rankings are shown on the following page.

If you notice any errors in the lake's data or physical information, or are aware of any additional or missing information, please contact Brian Johnson of the Metropolitan Council at (651) 602-8743 or brian.johnson@metc.state.mn.us.

Lake Water Quality Assessment

This summary is based on available summer (June through September) data in STORET (STOF the national water quality data repository developed by the United States Environmental Protec Agency. All water quality data collected by MPCA or received from external groups is placed in STORET.) collected between 1999 and 2008.

Data Quality: excellent
Aquatic Recreation Use Support: Non-supporting Lakes are worse than (exceed) the aquatic recrea support thresholds with sufficient data to make an assessment for aquatic recreation use (at least 10 T Chl-a, and 10 Secchi). These lakes appear on the 303(d) Impaired Waters List.

Lake Water Quality Data Summary

Total Phosphorus Mean: 48.84615385 ppb (parts per billion)
Total Phosphorus Standard Error: 4.588511509 ppb
Total Phosphorus # of Observations: 26

Chlorophyll-a Mean: 31.52093023 ppb
Chlorophyll-a Standard Error: 3.437155392 ppb
Chlorophyll-a # of Observations: 43

Carlson Trophic Status for Secchi Disk: 56.26202728
Overall Trophic Status: E
(O=oligotrophic, M=mesotrophic, E=eutrophic, H=hypereutrophic)

See the Difference! **Oligotrophic** vs. **Hypereutrophic**

Watch how lakes change over the summer.

Compare this lake to reference lakes or all assessed lakes.

Transparency *Chlorophyll-a* *Total Phosphorus*

Horseshoe Lake [Sunfish Lake] (19-0051) *City of Sunfish Lake*

Horseshoe Lake is an approximate 16-acre lake located within the City of Sunfish Lake (Dakota County). There is very little morphological information available for the lake.

On each sampling day the lake was monitored for total phosphorus (TP), chlorophyll-a (CLA), total kjeldahl nitrogen (TKN), and Secchi transparency, as well as the lake's perceived physical condition and recreational suitability. The resulting data and graphs appear on the next page.

2009 summer (May-September) data summary

Parameter	*Mean*	*Minimum*	*Maximum*	*Grade*
TP (µg/l)	25.6	16.0	42.0	B
CLA (µg/l)	4.5	2.7	10.0	A
Secchi (m)	2.3	2.0	3.2	B*
TKN (mg/l)	0.69	0.55	0.88	
			Lake Grade	B

* see discussion below

The lake's 2009 lake water quality grade was a B, which was similar to last year's lake grade. However, the water clarity was better than the Secchi depth data would suggest since most of the measurements were made with the Secchi disk visible on the lake bottom. Therefore the Secchi depth mean and grade given above underestimate the actual water clarity. To better understand the lake's water quality and where it may be heading, additional years of data collection are needed.

Throughout the monitoring period, the volunteer's opinions of the lake's physical condition and recreational suitability were ranked on a 1-to-5 scale. These user perception rankings are shown on the following page.

If you notice any errors in the lake's data or physical information, or are aware of any additional or missing information, please contact Brian Johnson of the Metropolitan Council at (651) 602-8743 or brian.johnson@metc.state.mn.us.

Rogers Lake (19-0080) – *Lower Mississippi River Watershed Management Organization*

Rogers Lake lies within the City of Mendota Heights. The lake has a surface area of 94 acres and a maximum depth of 2.4 m (7.9 ft). The entire area of the lake is considered littoral zone which is the 0-15 feet depth zone of aquatic plant dominance. Furthermore, the lake does not maintain a thermocline, which is a density gradient caused by changing water temperatures throughout the water column.

On each sampling day the lake was monitored for total phosphorus (TP), chlorophyll-a (CLA), total kjeldahl nitrogen (TKN), and secchi transparency, as well as the lake's perceived physical condition and recreational suitability. The resulting data are summarized in tables and figures on the following page.

2009 summer (May-September) data summary

Parameter	*Mean*	*Minimum*	*Maximum*	*Grade*
TP (µg/l)	39.9	28.0	68.0	C
CLA (µg/l)	8.5	4.2	12.0	A
Secchi (m)	1.3	1.0	1.5	C
TKN (mg/l)	1.32	0.86	1.90	
			Lake Grade	B

The lake received a lake grade of B for 2009. Additional years of monitoring are suggested for continuing to build the water quality database so as to better understand the lake's water quality and determine potential water quality trends.

The water clarity grade of C does not correlate well with the chlorophyll-a grade of A. A possible explanation may be that the water clarity may be affected by higher levels of total suspended solids from surface runoff from the surrounding urbanized watershed. It is possible for higher suspend solids loadings to decrease water clarity which would decrease light penetration thereby inhibiting algal growth.

Throughout the monitoring period, the volunteer's opinions of the lake's physical condition and recreational suitability were ranked on a 1-to-5 scale. These user perception rankings are shown on the following page.

The Fisheries Section of the Minnesota Department of Natural Resources (MDNR) has conducted a fisheries survey on the lake. Information on the survey can be obtained through the MDNR Fisheries Section by calling (651) 259-5831 or by downloading the information off the Internet at http://www.dnr.state.mn.us/lakefind/.

If you notice any errors in the lake's data or physical information, or are aware of any additional or missing information, please contact Brian Johnson of the Metropolitan Council at (651) 602-8743 or brian.johnson@metc.state.mn.us.

CITY OF SAINT PAUL
INTERDEPARTMENTAL MEMORANDUM

October 3, 1984

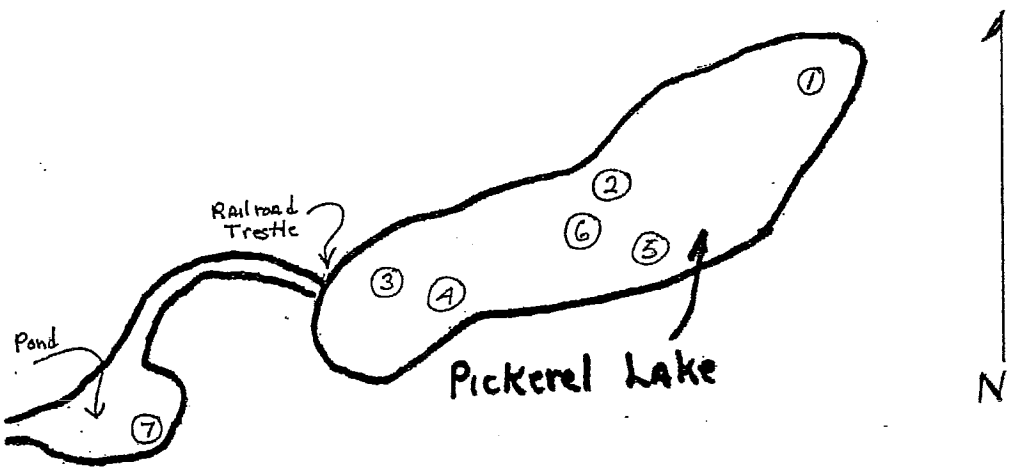
TO: Timothy M. Agness

FROM: William F. Gunther, Laboratory Director WFG
CITY OF ST. PAUL HEALTH DIVISION

SUBJECT: Test results from Pickerel Lake

The test results from the water samples taken from Pickerel Lake on Sept. 14, 1984 are as follows:

Location number	Fecal Coliform	Total Plate Count
1	43	220
2	93	750 est
3	9	160
4	< 3	430 est
5	< 3	320 est
6	3	170
7	240	1,080 est



The standard for natural water for swimming is less than 200 fecal coliforms and less than a 1,000 on the total plate count. All of the samples passed bacteriologically accept the pond sample #7.

The samples indicate that the lake water quality is bacteriologically safe for swimming.

APPENDIX F

Water Body Categories from 2001 Classification System

The 2001 plan required the member cities to manage the non-intercommunity water bodies to achieve the cities' goals, while the WMO was responsible for monitoring the intercommunity water bodies. The classifications were preliminary due to limited amounts of water quality information. Member cities classified their water bodies individually based on their level of use.

Category I - Water bodies in this category are typically used for swimming and other direct contact recreational activities. These water bodies have the highest/best water quality and are usually the most popular water bodies with the public.

- Rogers Lake – Mendota Heights
- Sunfish Lake – Sunfish Lake

Category II - Water bodies in this category are typically used for indirect contact recreational activities such as boating and fishing that involve incidental contact with surface water. These water bodies have poorer water quality than Category I water bodies, but are still popular with the public.

- Seidl's Pond – South St. Paul/Inver Grove Heights
- Thompson Lake – West St. Paul
- Marthaler Pond – West St. Paul
- 19-93 W – Mendota Heights
- Wood Duck Pond – Sunfish Lake
- Horseshoe Lake – Sunfish Lake

Category III - Water bodies in this category serve important functions for wildlife habitat and aesthetic enjoyment, and may also provide opportunities for warm-water fishing, provided winterkill does not occur. These water bodies have poorer water quality than Category I and II water bodies and typically are not viewed as swimmable.

- Dickman Lake/Loch Gregor – Inver Grove Heights/Sunfish Lake
- Bohrer Pond – Inver Grove Heights/South St. Paul
- Hornbean Lake – Sunfish Lake/Inver Grove Heights
- Pickerel Lake – Lilydale/St. Paul
- Schmitt Lake – Inver Grove Heights/Sunfish Lake/West St. Paul
- Lily Lake – West St. Paul
- Mud Lake – West St. Paul
- Dodge Nature Center Ponds – West St. Paul
- Friendly Marsh – Mendota Heights
- 19-103 P, 19-227 W, 19-228 W, 19-118 W, 19-108 W, 19-235 W, 19-232 W – Mendota Heights

Category IV - Nutrient Traps. Water bodies in this category are intended to reduce downstream loading of phosphorus and other nutrients that contribute to water pollution. These water bodies are designed to have phosphorus removal efficiencies of at least 50%.

- Golf Course Pond – Inver Grove Heights/West St. Paul
- LeVander Pond – South St. Paul
- Anderson Pond – South St. Paul
- 19-229 W, 19-234 W, 19-231 W, 19-233 W – Mendota Heights

Category V - Sediment Traps. These water bodies are similar to Category IV water bodies, but are too small to effectively remove a significant fraction of nutrients. These basins will generally have phosphorus removal efficiencies of less than 50%.

- 19-119 W, 19-104 W – Mendota Heights

The monitoring effort required for water bodies using this classification system is as follows:

Water Body Classification	**Type of Monitoring**
Category I	Survey Level – minimum requirement Management Level– only under certain conditions.
Category II/III	Secchi disk monitoring (i.e. MPCA's Citizen Lake Monitoring Program).
Category IV/V	As required by city maintenance plans and policies.

GENERAL NOTES:

1. CONTRACTOR TO STORE STONE AND SOIL THAT IS USEFUL ONSITE AT DESIGNATED AREA AS DIRECTED BY THE COR. LEGALLY DISPOSE OF ALL DEMOLISHED ASPHALT AND EXCESS STONE AND SOIL OFFSITE.
2. CONDUCT DEMOLITION AND CONSTRUCTION ACTIVITIES IN SUCH A MANNER TO PROVIDE MINIMAL TRAFFIC AND FACILITY DISRUPTION.
3. EXISTING UTILITIES SHALL REMAIN IN SERVICE DURING CONSTRUCTION.
4. FIELD VERIFY ALL DIMENSIONS ON THE SITE PRIOR TO CONSTRUCTION AND IDENTIFY DISCREPANCIES TO THE PRIME CONTRACTOR.
5. CONTRACTOR TO COMPLY WITH ALL LOCAL, STATE, AND FEDERAL LAWS AND REGULATIONS.
6. NOTIFY ALL UTILITIES 72 HOURS PRIOR TO START OF CONSTRUCTION TO VERIFY UTILITIES THAT MIGHT BE PRESENT ON SITE.
7. CAUTION! THERE MAY BE EXISTING UNDERGROUND UTILITIES OF WHICH THERE IS NO ABOVE GROUND EVIDENCE OBSERVED. EXACT LOCATION OR UTILITIES SHALL BE VERIFIED BY THE CONTRACTOR PRIOR TO CONSTRUCTION. CALL (888) 858 - 9830 BEFORE YOU DIG.

GENERAL NOTES:

1. ALL EXCAVATION, TRENCHING, SHEETING, SHORING, AND BRACING SHALL BE PROVIDED AS REQUIRED IN ACCORDANCE WITH LOCAL, STATE, AND FEDERAL REGULATIONS, INCLUDING OSHA (29 CFR 1925) AND EM 385-1-1 (U.S. ARMY CROPS OF ENGINEERS SAFETY MANUAL). SHORING, SHEETING, AND BRACING DESIGN SHALL BE PREPARED BY A PROFESSIONAL ENGINEER WITH SIGNED AND SEALED CALCULATIONS PROVIDED.
2. ALL ITEMS INDICATED TO BE REMOVED OR DEMOLISHED SHALL BECOME PROPERTY OF THE CONTRACTOR AND SHALL BE REMOVED FROM PROJECT SITE AND DISPOSED OF IN ACCORDANCE WITH ALL LOCAL, STATE, AND FEDERAL REGULATIONS. NO SALVAGE VALUE IS EXPRESSED OR IMPLIED BY THESE CONTRACT DOCUMENTS FOR ANY ITEMS TO BE REMOVED OR DEMOLISHED.
3. WHERE ACTUAL DIMENSIONS AND SIZES ARE PROVIDED IN THE DRAWINGS, THEY SHALL TAKE PRECEDENCE OVER SCALED DIMENSIONS. LARGE SCALE DRAWINGS SHALL TAKE PRECEDENCE OVER SMALL SCALE DRAWINGS.
4. IF CONTAMINATED MATERIAL IS ENCOUNTERED DURING PROJECT WORK NOTIFY THE CONTRACTING OFFICER IMMEDIATELY.
5. SEE SHEET S-001 FOR ADDITIONAL NOTES.
6. NEW PERIMETER FENCE AND GATE SHALL BE CONSTRUCTED PRIOR TO REMOVAL OR DEMOLITION OF EXISTING FENCE.
7. THE CONTRACTOR SHALL USE FLAGGER OPERATION ALONG AIRPORT ROAD DURING THE CONSTRUCTION OF THE NEW CONCRETE DRIVEWAY AND GATE #4.

DUCTILE IRON PIPE AND FITTINGS NOTES:

1. DUCTILE IRON PIPE SHALL CONFORM TO ANSI/AWWA C150/A21.50 AND ANSI/AWWA C151/A21.51. CLASS 53.
2. FITTINGS SHALL BE AWWA C110 AND RATED FOR 350 PSI.
3. DUCTILE IRON PIPE AND FITTINGS SHALL HAVE A CEMENT LINING PER AWWA C104 THAT IS NSF APPROVED. PIPE JOINTS SHALL HAVE NITRILE GASKET MEETING ALL REQUIREMENTS OF AWWA C111 FOR FUEL RESISTANT PROPERTIES.

CONCRETE FOR PAVEMENT NOTES:

1. CONCRETE PAVEMENT SHALL INCLUDE THE TRUCK CONTAINMENT PAD AND ALL NEW OR REPLACED PAVEMENT SLABS, UNLESS NOTED OTHERWISE. MATERIALS, CONSTRUCTION AND TESTING REQUIREMENTS FOR THE CONCRETE PAVEMENT SHALL BE IN ACCORDANCE WITH THE REQUIREMENTS INDICATED IN THE MNDOT STANDARD SPECIFICATIONS FOR CONSTRUCTION, 2016 EDITION, SECTION 2301 AND AS AMENDED HEREIN.

MINIMUM COMPRESSIVE STRENGTH	4500 PSI AT 28 DAYS
MINIMUM FLEXURAL STRENGTH	650 PSI AT 28 DAYS.

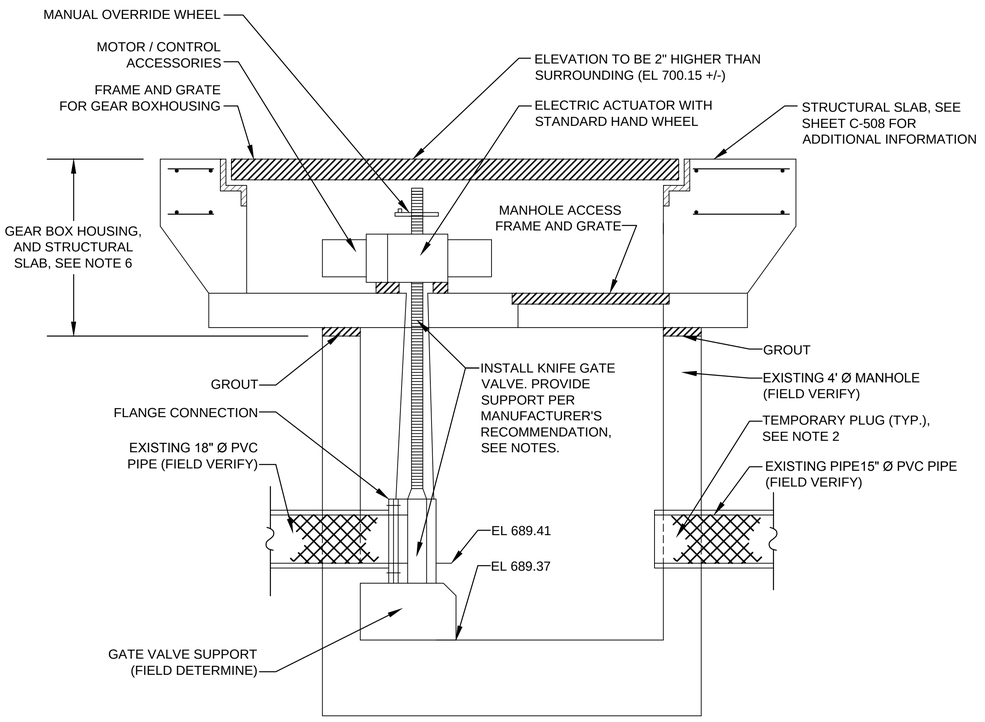
B1 DETAIL - MODIFIED EXISTING MAN HOLE
SCALE: NOT TO SCALE
C-402



B4 SECTION
SCALE: NOT TO SCALE
C-507

NOTES:

1. HISTORICAL DRAWINGS (PROJECT 97-165A, MINNESOTA DEPARTMENT OF MILITARY AFFAIRS, 4-11-2001, AS DESIGNED BY LOUCKS AND ASSOCIATES) INDICATE THE EXISTING CANAL GATE IS A WATERMAN CANAL GATE, MODEL C-20 OR APPROVED EQUAL. AS-BUILT DRAWING ARE NOT AVAILABLE AT THE THIS TIME. THE CONTRACTOR SHALL VISIT THE SITE TAKE NECESSARY MEASUREMENTS AND INSPECT THE CONDITIONS OF THE MANHOLE AND GATE PRIOR TO FABRICATING NEW VALVE AND SUPPORT STRUCTURES.

2. THE CONTRACTOR SHALL INSTALL TEMPORARY PLUGS TO ALL INCOMING AND OUT-GOING PIPES AT THIS MANHOLE AND AT THE PIPE OF THE IMMEDIATE UPSTREAM MAHHOLE, CATCH BASIN OR INLET THAT DRAINS TO THIS MANHOLE. SEE REFERENCE DRAWINGS FOR LOCATIONS OF THESE DRAINAGE STRUCTURES. THE TEMPORARY PLUGS SHALL BE IN PLACE TO ENSURE THE WORK ARE BEING PERFORMED IN THE DRY. REMOVE THE TEMPORARY PLUGS WHEN THE NEW VALVE AND ITS SUPPORTS ARE SECURELY INSTALLED. REMOVE THE TEMPORARY PLUGS WHEN INCLEMENT WEATHER IS APPROACHING OR WHEN DIRECTED BY THE FACILITY OPERATOR. PROVIDE MEANS TO PREVENT SURFACE WATER FROM ENTERING THE WORK AREA.

3. THE EXISTING MANHOLE SURFACE SHALL BE WATER BLASTED CLEAN AND ALL THE WATER SHALL BE REMOVED AND BE DISPOSED IN A LEGAL MANNER.

4. REMOVE THE EXISTING CANAL GATE. PROTECT THE EXISTING PIPE FLANGE, IF PRESENT. IN THE EVENT THE EXISTING PIPE FLANGE IS DAMAGED OR NOT PRESENT, PROVIDE A FLANGE ADAPTER COMPATIBLE WITH THE EXISTING PIPE MATERIAL AND TO THE SELECTED KNIFE GATE VALVE. ENSURE THE CONNECTIONS ARE WATER TIGHT.

5. THE KNIFE GATE VALVE AND MOTORIZED ACTUATOR (MOV) SHALL HAVE THE FOLLOWING DESIGN FEATURES:

   a. KNIFE GATE VALVE MEETING AWWA C520 OR MSS SP-81
   b. BONNETED KNIFE GATE VALVE WITH DRIP-TIGHT SHUTOFF.
   c. EXPLOSION-PROOF RATING ELECTRIC ACTUATOR.
   d. MAXIMUM ALLOWABLE TIME FOR OPENING OR CLOSING THE VALVE VIA THE ELECTRIC ACTUATOR IS 90 SECONDS.

6. REMOVE TOP OF THE EXISTING MANHOLE TO LIMITS NECESSARY FOR THE CONSTRUCTION OF THE COVERING STRUCTURAL SLAB AND THE MOV HOUSING. INSPECT AND REPAIR ANY DAMAGE TO THE EXISTING MANHOLE PRIOR TO CONSTRUCTING THE STRUCTURAL SLAB.

7. SEE SHEET C-508 FOR ADDITIONAL REQUIREMENTS.

SHEET IDENTIFICATION NUMBER
C-508

DRAWINGS AND SPECIFICATIONS:

1. DO NOT SCALE DRAWINGS FOR DIMENSIONS NOT GIVEN.
2. ADVISE ENGINEER OF DIMENSIONAL DISCREPANCIES.
3. VERIFY ALL EXISTING FIELD CONDITIONS AND DIMENSIONS PRIOR TO COMMENCING CONSTRUCTION.
4. THE CONTRACTOR SHALL PERFORM NO PORTION OF THE WORK AT ANY TIME WITHOUT CONTRACT DOCUMENTS OR, WHERE REQUIRED, APPROVED SHOP DRAWINGS, PRODUCT DATA OR SAMPLES FOR SUCH PORTION OF THE WORK.

CONSTRUCTION SAFETY:

1. THESE DRAWINGS DO NOT INCLUDE PROVISIONS TO SATISFY SAFETY REQUIREMENTS. CONTRACTOR IS SOLELY RESPONSIBLE FOR ENSURING SAFETY DURING CONSTRUCTION AND FOR CONFORMANCE TO ALL APPLICABLE OSHA STANDARDS AND OTHER APPLICABLE CODES. JOBSITE VISITS BY ENGINEER SHALL NOT CONSTITUTE APPROVAL, AWARENESS OR LIABILITY FOR ANY HAZARDOUS CONDITIONS.

SHORING AND SUPPORT:

1. WHEN REMOVAL OF STRUCTURAL ELEMENTS FOR MODIFICATIONS MAY CAUSE TEMPORARY WEAKNESS, EXCESSIVE DEFLECTIONS OR STRUCTURAL INSTABILITY, SHORING OR OTHER SUITABLE SUPPORTS SHALL BE PROVIDED UNTIL COMPLETION AND ADEQUATE CURING OF MODIFICATIONS.

FIELD MODIFICATIONS:

1. ANY CHANGES TO THE STRUCTURAL DRAWINGS SHALL HAVE BEEN REVIEWED AND APPROVED IN WRITING BY THE ENGINEER PRIOR TO COMMENCING WORK ON ITEMS AFFECTED.
2. CONTRACTOR SHALL PROVIDE SKETCHES, PHOTOGRAPHS AND WRITTEN DESCRIPTION OF EACH DEVIATION FROM THE PLANS FOR THE ENGINEER'S REVIEW.

FOUNDATIONS:

1. NOTIFY ENGINEER IF FOOTING EXCAVATION REVEALS UNSUITABLE OR UNSTABLE SOILS OR MATERIALS OR CONDITIONS NOT PREVIOUSLY ANTICIPATED.
2. CONTRACTOR SHALL CONSIDER THE POSSIBLE IMPACT OF GROUNDWATER ON CONSTRUCTION TECHNIQUES, SEASONAL VARIATIONS, AND ANY OTHER SITE INDICATORS AT HIS OWN JUDGMENT.
3. SOIL DIRECTLY BELOW FOUNDATIONS AND SLAB ON GRADE SHALL BE COMPACTED TO 95% OF THE ASTM D 1557 (MODIFIED PROCTOR) MAXIMUM DRY DENSITY.

GENERAL FUELING NOTES

1. DRAWINGS ARE IN GENERAL DIAGRAMMATIC IN NATURE. NOT ALL COMPONENTS ARE SHOWN IN ALL VIEWS. THE CONTRACTOR SHALL MAKE USE OF THE ENTIRE SET OF DRAWINGS AND REQUIREMENTS IN SPECIFICATIONS IN ORDER TO INCLUDE ALL COMPONENTS NECESSARY TO CONSTRUCT A FULLY OPERATIONAL FUELING SYSTEM.
2. WRITTEN DIMENSIONS ON DRAWINGS SHALL HAVE PRECEDENCE OVER SCALED DIMENSIONS.
3. THE CONTRACTOR AND SUB CONTRACTORS SHALL COORDINATE ALL WORK WITH ALL OTHER TRADES BEFORE ANY INSTALLATION IS MADE.
4. AT START OF CONSTRUCTION, THE CONTRACTOR AND EACH OF HIS SUBCONTRACTORS SHALL PREPARE TYPED LISTS OF ALL EQUIPMENT THAT THEY ARE SUPPLYING WHICH REQUIRE ELECTRICAL WORK AND SEND LISTS TO THE ELECTRICAL CONTRACTOR FOR HIS REVIEW AND COORDINATION.
5. ALL EQUIPMENT SHALL BE INSTALLED IN ACCORDANCE WITH MANUFACTURER'S APPROVED PUBLISHED LITERATURE.
6. INSTALLATION OF EQUIPMENT SHALL PERMIT ACCESSIBILITY FOR SERVICE AND/OR REPLACEMENT.
7. MATERIALS AND EQUIPMENT SHALL BE A STANDARD PRODUCT OF A MANUFACTURER REGULARLY ENGAGED IN THE MANUFACTURE OF THE PRODUCT AND SHALL HAVE BEEN IN SATISFACTORY USE FOR A MINIMUM OF 2 YEARS.
8. EQUIPMENT INSTALLED SHALL BE CAPABLE OF BEING SERVICED BY AN ORGANIZATION THAT IS, IN THE OPINION OF THE CONTRACTING OFFICER, REASONABLY CONVENIENT TO THE SITE. MATERIALS AND EQUIPMENT SHALL BE INSTALLED IN ACCORDANCE WITH RECOMMENDATIONS OF THE MANUFACTURER.
9. MAJOR COMPONENTS OF EQUIPMENT SHALL HAVE THE MANUFACTURER'S NAME, ADDRESS, TYPE OR STYLE, AND CATALOG NUMBER ON A NON-CORROSIVE AND NON-HEAT SENSITIVE PLATE, SECURELY ATTACHED TO THE EQUIPMENT. THIS PLATE SHALL REMAIN VISIBLE. ALL PIPES SHALL BE MARKED IN ACCORDANCE WITH MIL-STD-161 AND THESE DRAWINGS.
10. ALL EQUIPMENT DELIVERED AND PLACED IN STORAGE PRIOR TO INSTALLATION SHALL BE PROTECTED FROM WEATHER, HUMIDITY AND TEMPERATURE VARIATION, DIRT AND DUST, AND ANY OTHER CONTAMINANTS.
11. THE CONTRACTOR SHALL KEEP ONE EXISTING FUELING SKID IN OPERATION DURING THE INSTALLATION OF THE FUEL EQUIPMENT SKID, PIPING AND TRUCK CONTAINMENT PAD PROVIDED UNDER THIS CONTRACT. IF FUELING OUTAGES ARE REQUIRED, COORDINATE AND MAKE PROVISIONS FOR TEMPORARY FUELING WITH THE BASE PERSONNEL FOR THOSE OUTAGE PERIODS.

FOR REVIEW ONLY
CORRECTED 100% DESIGN
"NOT FOR CONSTRUCTION"

PROJECT PHASING NOTES:

1. PHASE 1- REMOVE AND DISPOSE OF F-24 DISPENSING SKID NO. 1 AND ASSOCIATED PIPING. SKID SHALL BE PURGED OF FUEL PRIOR TO DISPOSAL. CONCRETE SKID ISLAND SHALL REMAIN. THE REMAINING DISPENSING SKID NO. 2 SHALL REMAIN ACTIVE. DISPOSE OF SKID NO. 1 AND ASSOCIATED PIPING OFF GOVERNMENT PROPERTY.

2. PHASE 2- INSTALL FUEL EQUIPMENT SKID AS SHOWN ON DWG. M-401.

3. PHASE 3- THE UNDERGROUND SUCTION PIPING SHALL BE DISCONNECTED FROM THE STORAGE TANK AND FLUSHED WITH 2 PIPE VOLUMES OF WATER. DISPOSE OF ALL WATER USED IN THE FLUSHING OPERATION AND WASTE FUEL OFF OF GOVERNMENT PROPERTY. DRAIN, FLUSH , AND GAS FREE THE UNDERGROUND SUCTION PIPING. REMOVE UNDERGROUND FUEL SUCTION PIPING TO EDGE OF FUEL SKID PADS. CUT PIPE, SLURRY FILL THE REMAINING PIPE. REMOVE DISPENSING SKID NO. 2 AND ASSOCIATED TRUCK FILL PIPING, LOADING HOSE, AND HOSE TROUGH. WHEN THE FUEL SYSTEM IS OUT OF COMMISSION DURING CONSTRUCTION, THE CONTRACTOR SHALL MAKE PROVISIONS FOR THE BASE TO BE ABLE TO FUEL THEIR TRUCKS VIA THE LOCAL FUELING STATION OFFSITE.

4. PHASE 4- INSTALL REPLACEMENT TANK SUMP, MANWAY COVER, OVERFILL FLOAT, SUCTION PIPING , AND TRANSITION SUMP. REMOVE TANK FILL PORT AND SPILL CONTAINER. INSTALL TANK SUCTION AND FILL PIPING AND SUPPORTS. INSTALL SUMP FOR TANK FILL LINE AND TRANSITION SUMP. SEE DRAWINGS M-401 AND M-501 FOR WORK DESCRIBED IN PHASE 4.

5. ONCE INSTALLATION IS COMPLETE, THE CONTRACTOR SHALL PERFORM TESTING AND COMMISSIONING OF ALL MECHANICAL PIPING AND EQUIPMENT. COMMISSIONING SHALL BE WITNESSED AND SIGNED OFF BY THE ENGINEER OF RECORD AND THE CONTRACTING OFFICER. ALL TESTING AND COMMISSIONING SHALL BE IN ACCORDANCE WITH REQUIREMENTS LISTED IN THE PROJECT SPECIFICATIONS.

FUELING SYSTEM REPAIRS
AASF ST. PAUL HOLMAN FIELD, MN

FUELING SYSTEM SCHEMATIC FLOW DIAGRAM

SHEET IDENTIFICATION NUMBER
M-601

GENERAL NOTES:

1. THE CONTRACTOR SHALL DESIGN AND CONSTRUCT ALL ELECTRICAL COMPONENTS FOR THE VARIOUS FUELING PROJECTS AT ST PAUL HOLMAN FIELD. THIS INCLUDES DESIGN, CONSTRUCTION, ALL NECESSARY LABOR, EQUIPMENT, AND MATERIALS FOR A FULLY FUNCTIONAL ELECTRICAL SYSTEM REQUIRED FOR SATISFACTORY OPERATION OF THIS PROJECT.
2. THE ELECTRICAL WORK MUST BE PROVIDED IN ACCORDANCE WITH THE LATEST ADOPTED EDITION OF THE NATIONAL ELECTRICAL CODE, NFPA 101 LIFE SAFETY CODE, NFPA 780, API 500, AND UFC 3-460-01 "PETROLEUM FUEL FACILITIES."
3. THE DESIGN AND CONSTRUCTION OF THE ELECTRICAL SYSTEM SHALL INCLUDE, BUT NOT BE LIMITED TO:
   A. PROVIDE GROUNDING SYSTEM FOR THE LOADING/OFFLOADING SKID.
   B. PROVIDE EFSO CONTROLS AND SIGNAGE
   C. PROVIDE MODIFICATIONS TO ELECTRICAL SKID
   D. PROVIDE AREA LIGHTING FOR LOADING/OFFLOADING SKID.
4. ALL MATERIALS USED MUST BE IN COMPLIANCE WITH ASTM STANDARDS OR UNDERWRITERS LABORATORIES INC. (UL) LISTED MATERIALS. EQUIPMENT ENCLOSURE TYPES MUST BE IN COMPLIANCE WITH THE NATIONAL ELECTRICAL MANUFACTURER'S ASSOCIATION (NEMA). MATERIAL AND EQUIPMENT INSTALLED MUST BE FOR THE APPROPRIATE APPLICATION.
5. MATERIALS AND EQUIPMENT MUST BE A STANDARD PRODUCT OF A MANUFACTURER REGULARLY ENGAGED IN THE MANUFACTURE OF THE PRODUCT AND MUST ESSENTIALLY DUPLICATE ITEMS THAT HAVE BEEN IN SATISFACTORY USE FOR AT LEAST 2 YEARS. EQUIPMENT INSTALLED MUST BE CAPABLE OF BEING SERVICED BY AN ORGANIZATION THAT IS, IN THE OPINION OF THE CONTRACTING OFFICER, REASONABLY CONVENIENT TO THE SITE.
6. MATERIALS AND EQUIPMENT MUST BE INSTALLED IN ACCORDANCE WITH MANUFACTURER RECOMMENDATIONS. MAJOR COMPONENTS OF EQUIPMENT MUST HAVE THE MANUFACTURER'S NAME, ADDRESS, TYPE OR STYLE, VOLTAGE AND CURRENT RATING, AND CATALOG NUMBER ON A NON-CORROSIVE AND NON-HEAT SENSITIVE PLATE, SECURELY ATTACHED TO THE EQUIPMENT.
7. ALL EQUIPMENT DELIVERED AND PLACED IN STORAGE, PRIOR TO INSTALLATION, MUST BE PROTECTED FROM THE WEATHER, HUMIDITY, AND TEMPERATURE VARIATIONS, DIRT AND DUST, AND ANY OTHER CONTAMINANTS.
8. ALL ELECTRICAL EQUIPMENT, FIXTURES AND COMPONENTS USED AND INSTALLED WITHIN HAZARDOUS AREAS AS DEFINED BY THE NEC SHALL BE SUITABLE FOR THOSE LOCATIONS.
9. ALL WIRING AND CABLES MUST BE COPPER, INSULATION MUST BE RATED TYPE THWN-2, MARKED "GASOLINE AND OIL RESISTANT" AND INSTALLED IN CONDUITS. MINIMUM WIRE SIZE, EXCEPT FOR CONTROL CABLES, MUST BE #12 AWG.
10. EXTERIOR WIRING AND CABLES MUST BE INSTALLED IN PVC (SCHEDULE 40, MIN) CONDUITS UNO.
11. PROVIDE GROUNDING IN ACCORDANCE WITH THE 2014 NEC, IN PARTICULAR ARTICLE 250. GROUND RESISTANCE MUST NOT EXCEED 25 OHMS. PROVIDE EQUIPMENT GROUNDING CONDUCTOR FOR ALL POWER AND CONTROL RACEWAYS.
12. ALL RACEWAYS MUST BE CONCEALED IN FINISHED SLAB OR GRADE. ALL RACEWAYS MUST BE INSTALLED PARALLEL AND PERPENDICULAR TO CEILINGS.
13. ALL CONDUCTOR SPLICING MUST BE PERFORMED IN JUNCTION OR PULL BOXES; MINIMIZE SPLICING OF CONDUCTORS. PROPER WIRE NUTS/CONNECTORS MUST BE UTILIZED FOR SPLICING WIRE. DO NOT PROVIDE TWIST WIRE CONNECTORS OR ELECTRICAL TAPE WRAPPED AROUND THE WIRE.
14. PROVIDE SCHEDULE 40 PVC CONDUIT (MINIMUM THICKNESS) FOR ALL UNDERGROUND CONDUITS AND RIGID GALVANIZED STEEL CONDUITS INCLUDING ELBOW RISERS AND CONDUITS EXPOSED TO THE WEATHER. BURY CONDUITS AT A MINIMUM DEPTH OF 24 INCHES BELOW GRADE OR PAVEMENT OR GRASS UNO.
15. PROVIDE PULL WIRE FOR ALL EMPTY CONDUITS.
16. CABLE WARNING TAPE SHALL BE PROVIDED 6 INCHES ABOVE ALL UNDERGROUND CONDUITS.
17. CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING HAND-HOLES, MANHOLES AND/OR PULL BOXES, WHEREVER DEEMED NECESSARY.
18. PROVIDE SEPARATE NEUTRAL CONDUCTOR FOR EACH 120V BRANCH CIRCUIT WHEN CIRCUITS ARE COMBINED INTO A SINGLE CONDUIT PER NEC FOR MULTIWIRE CIRCUITS.
19. ALL EMPTY CONDUITS MUST BE PROVIDED WITH A PULL ROPE. ALL PULL ROPES MUST BE SECURELY ATTACHED AT THE END OF EACH CONDUIT OR PULL BOX.
20. GRANT THE GOVERNMENT JOINT OCCUPANCY OF ALL ELECTRICAL, COMMUNICATIONS AND CONTROLS ENCLOSURES 14 DAYS PRIOR TO COMPLETION OF THE FACILITY.
21. ALL COMMUNICATIONS & CONTROL CABLES MUST BE CONTINUOUS WITHOUT SPLICES FROM TERMINATION POINT TO TERMINATION POINT.
22. ALL CONDUCTORS AND CABLES MUST BE INSTALLED IN CONDUIT.
23. FOR 20A, 1P, 120V CKT LESS THAN 60 FT, PROVIDE #12 CONDUCTORS FOR PH, NEUT., AND EQUIP GND. FOR DISTANCE EXCEEDING 60 FT, PROVIDE #10 CONDUCTORS FOR PH, NEUT, AND EQUIP GND. PROVIDE SEPARATE NEUT CONDUCTOR FOR EA CKT.
24. PROVIDE A MINIMUM OF 8 HOURS OF NORMAL WORKING TIME TO TRAIN THE OPERATING STAFF OF ALL ASPECTS OF THE ELECTRICAL POWER DISTRIBUTION, FIRE ALARM SYSTEM, AND THE FUELING CONTROL SYSTEMS. ALL SYSTEMS MUST BE TESTED IN THE PRESENCE OF THE CONTRACTING OFFICER FOR SATISFACTORY OPERATION PRIOR TO ACCEPTANCE.
25. EMERGENCY FUEL SHUT-OFF (EFSO) STATION HOUSING SHALL BE A GALVANIZED STEEL ENCLOSURE WITH A HINGED GLASS FRONT AND AN OPEN BOTTOM. PAINT THE ENCLOSURE RED. MOUNTING HARDWARE SHALL BE CORROSION RESISTANT. MOUNT AN EMERGENCY PUSHBUTTON INSIDE THE STATION HOUSING. PUSHBUTTON SHALL BE ACCESSIBLE THROUGH THE HINGED FRONT. PUSHBUTTON SHALL BE A SINGLE UNIT WITH A JUMBO MUSHROOM OPERATOR, 1-NC AND 1-NO CONTACT. DURING ACTIVATION, THE PUSHBUTTON SHALL MAINTAIN CONTACT UNTIL DEACTIVATED BY A KEY RELEASE. MOUNT A CAUTION SIGN BESIDE THE EMERGENCY SHUTDOWN STATION, WITH RED 50 MM 2 INCH LETTERS STATING "EMERGENCY SHUTDOWN". THE SIGN SHALL HAVE WHITE BACKGROUND AND BE OF NONCORROSIVE CONSTRUCTION.

1 ED101 ELECTRICAL SITE PLAN - EXISTING CONDITIONS & DEMOLITION
SCALE: 1" = 10'-0"

GENERAL NOTES:

1. THE CONTRACTOR SHALL USE CARE DURING REMOVAL PROCESSES TO AVOID DAMAGING NEARBY FACILITIES TO REMAIN.
2. DISPOSAL OF ALL REMOVED MATERIALS SHALL BE OUTSIDE THE LIMITS OF GOVERNMENT-CONTROLLED LANDS IN ACCORDANCE WITH FEDERAL, STATE, AND LOCAL REGULATIONS.
3. THE CONTRACTOR SHALL NOTIFY THE CONTRACTING OFFICER REPRESENTATIVE IF ANY MATERIAL TO BE DISPOSED OF IS FOUND TO CONTAIN HAZARDOUS, TOXIC, BIOLOGICAL OR RADIOLOGICAL SUBSTANCES.
4. RUBBISH AND DEBRIS SHALL BE REMOVED FROM GOVERNMENT PROPERTY DAILY TO AVOID ACCUMULATION AT THE PROJECT SITE.
5. PROPERLY DISPOSE OF EXISTING CONTROL PANEL, CONTROL WIRING, BRANCH CIRCUIT CONDUCTORS AND CONDUITS. CONDUITS CAN BE ABANDONED IN-PLACE IF IT IS INACCESSIBLE. HOWEVER, CONDUIT SHALL BE PLUGGED AND CAPPED. CUT CONDUIT FLUSH WITH FINISHED GRADE. EXISTING CONDUIT MAYBE RE-USED AT CONTRACTOR RISK AND EXPENSE.
6. EXISTING UNDERGROUND FEEDER CONDUCTORS AND CONDUITS FOR DEMOLISHED MOTOR TO REMAIN FOR RE-USE. TERMINATE CONDUCTORS AND CONDUITS AT JB WITH UNISTRUT SUPPORT. MOUNT JB AT 24" AFF TO BOTTOM.
7. ALL EXISTING ELECTRICAL EQUIPMENT ARE FUNCTIONAL AND OPERATIONAL. CONTRACTOR SHALL NOTIFY CONTRACTING OFFICER REPRESENTATIVE IMMEDIATELY IF EQUIPMENT, BRANCH CIRCUITS ARE FOUND TO BE DEFECTIVE.

KEY NOTES (#):

1. REMOVE EXISTING MOTION SENSOR AND WIRING BACK TO NEAREST JUNCTION BOX FOR FENCING WORK. RE-INSTALL MOTION SENSOR AFTER GATE INSTALLATION IS COMPLETED. INSTALL CONDUCTORS IN 3/4" C.
2. PROVIDE JUNCTION BOX AND INTERCEPT EXISTING RECEPTACLE CIRCUIT (2#12 & 1#12 GND IN 3/4" C.). AND EXTEND CIRCUITS VIA UNDERGROUND TO JUNCTION BOX AS INDICATED.
3. EXISTING RECEPTACLE CIRCUIT (2#12 & 1#12 GND IN 3/4" C.) SURFACE MOUNTED ON PERIMETER FENCE TO REMAIN.

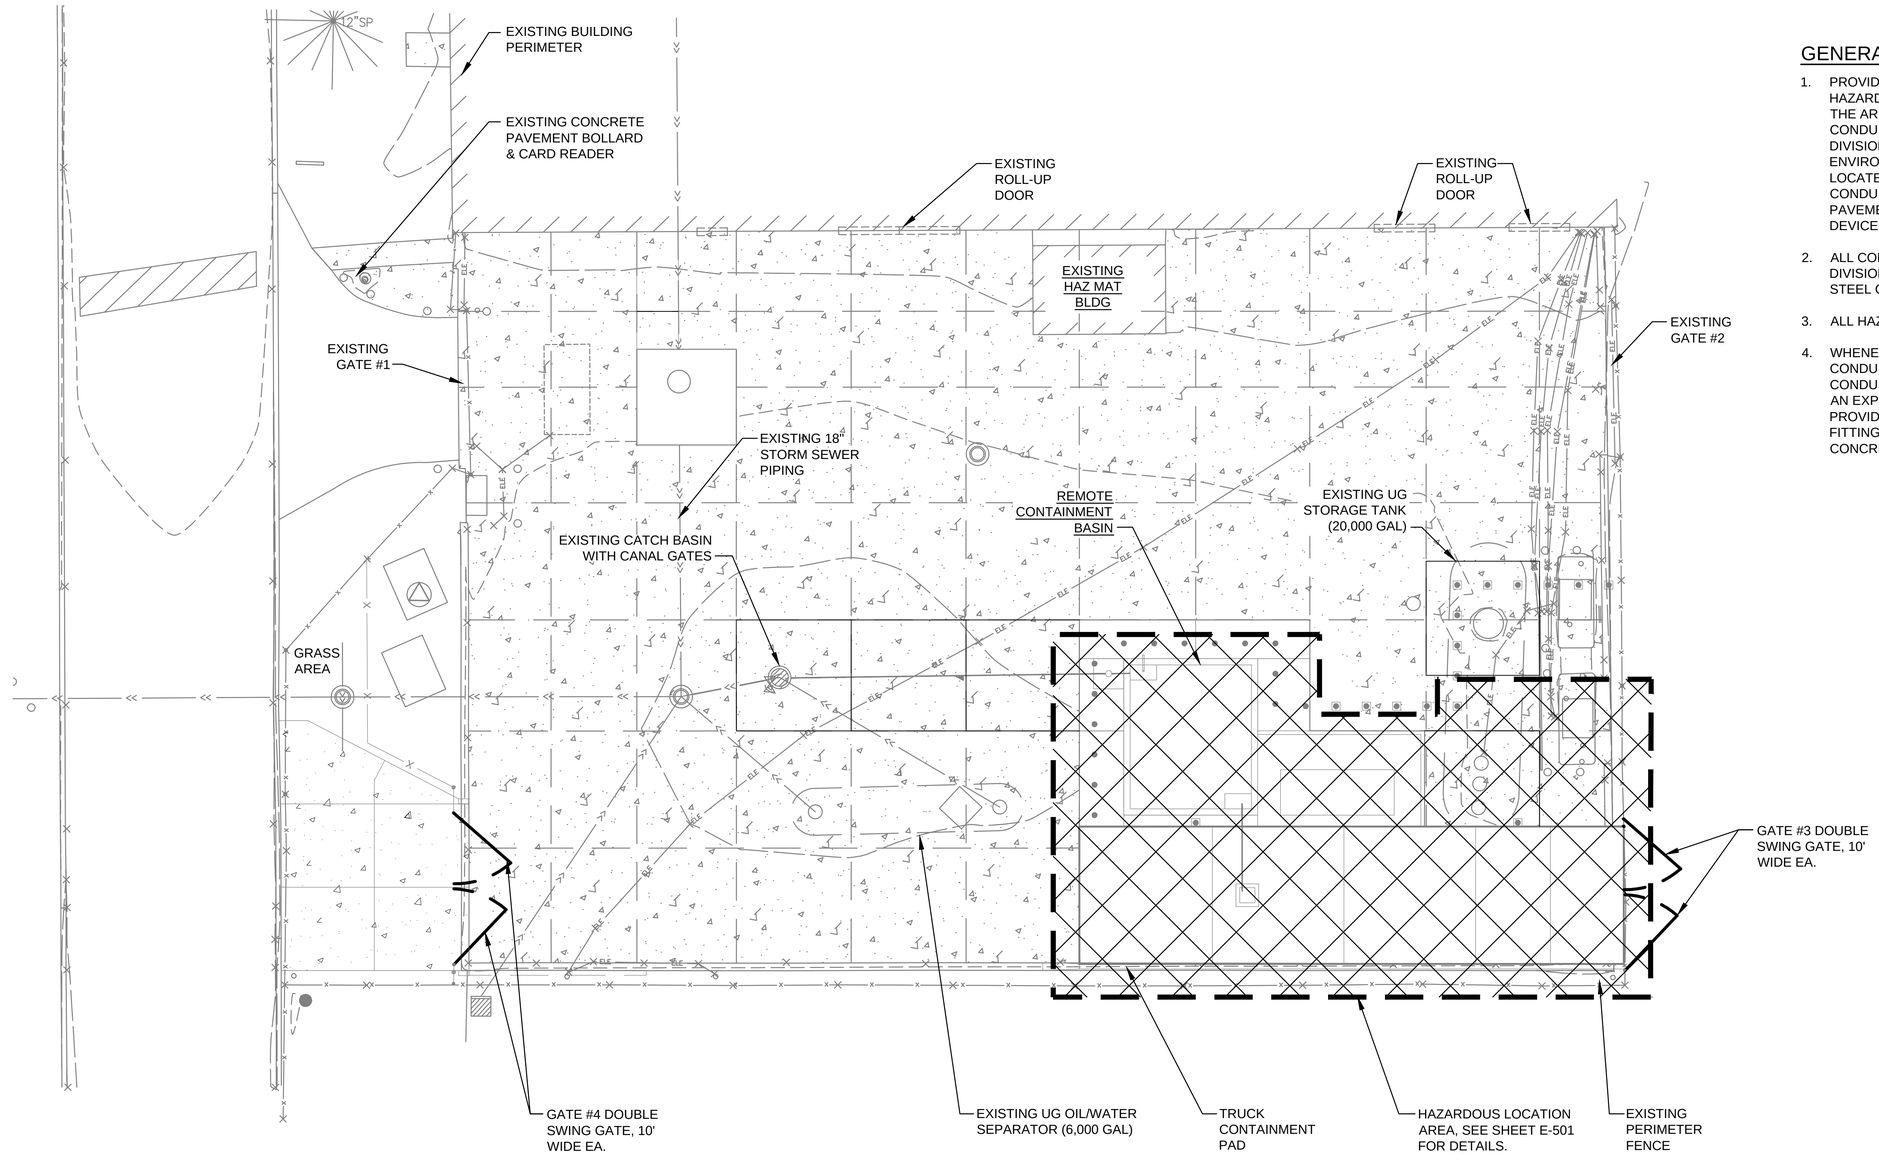
FOR REVIEW ONLY
CORRECTED 100% DESIGN
"NOT FOR CONSTRUCTION"



GENERAL NOTES:

1. PROVIDE RIGID GALVANIZED STEEL CONDUIT FOR HAZARDOUS AREAS. ALL CONDUITS ENTERING OR EXITING THE AREAS MUST BE PROVIDED WITH EXPLOSION PROOF CONDUIT SEAL FITTINGS, UL LISTED FOR USE IN CLASS I, DIVISION 1 & 2, GROUPS A,B,C&D, CLASSIFIED HAZARDOUS ENVIRONMENTS, CROUSE HINDS "EYS" SERIES OR EQUAL. LOCATE FITTINGS AT 18" ABOVE FINISHED SLAB WHERE CONDUITS EMERGE FROM EARTH OR CONCRETE SLAB OR PAVEMENT AND WITHIN 18" OF CONDUIT TERMINATION AT DEVICE OR EQUIPMENT AT EACH END OF CONDUITS.
2. ALL CONDUITS ROUTED WITHIN OR THROUGH A CLASS 1, DIVISION 1 & 2 AREA MUST BE THREADED RIGID GALVANIZED STEEL CONDUIT.
3. ALL HAZARDOUS LOCATION SEALS MUST BE ACCESSIBLE.
4. WHENEVER POSSIBLE, INSTALL ALL DEVICES AND ROUTE ALL CONDUITS OUTSIDE OF THE DEFINED HAZARDOUS AREA. IF CONDUITS MUST BE ROUTED THROUGH HAZARDOUS AREAS, AN EXPLOSION PROOF CONDUIT SEAL FITTING MUST BE PROVIDED AT EACH END OF THE CONDUIT WHERE THE FIRST FITTING AFTER THE CONDUIT EMERGES FROM THE EARTH OR CONCRETE.

"NOT FOR CONSTRUCTION"

GENERAL NOTES:

1. PROVIDE 1Ø, 2P, 120/208V, 125A, 22KAIC, 30 CIRCUIT PANELBOARD "F" WITH SHUNT TRIP UPSTREAM MAIN CIRCUIT BREAKER. TIE SHUNT TRIP MAIN CIRCUIT BREAKER TO EFSO CONTROL PANEL. INTERCEPT FEEDER TO EXISTING PANELBOARD "B", SPLICE FEEDER IN JUNCTION BOX TO FEED PANEL "F".
2. PROVIDE 480V, 90 AMP, 3P DUAL ELEMENT TIME DELAY CIRCUIT BREAKER IN EXISTING SPACE TO FEED OFF LOAD PUMP MOTOR. CIRCUIT BREAKER SHALL MATCH EXISTING PANEL CIRCUIT BREAKERS IN STYLE AND AIC RATING.
3. PROVIDE RELAY IN EXISTING FACP FOR CONNECTION TO EFSO CONTROL PANEL. COORDINATE WITH COR FOR CONNECTIONS TO EXISTING FACP.
4. PROVIDE 1Ø, 1P, 120V, 20A, CIRCUIT BREAKER IN SPACE IN ADJACENT PANELBOARD "M" MATCHING EXISTING CIRCUIT BREAKERS IN STYLE AND AIC RATING. RUN 2 #12 AWG & 1 #12 GND IN 3/4" CONDUIT FROM PANEL "M" TO FEED EFSO CONTROL PANEL.

KEY NOTES: (#)

1. 3 #8 AWG & 1 #10 AWG GND IN 1" CONDUIT FOR 208V MOV FEEDER CIRCUIT
2. (2) 3 #12 AWG EFSO CONTROL CIRCUITS IN 3/4" CONDUIT FOR EFSO PUSH BUTTON AND FOR MOV #2 SHUNT TRIP
3. (4) 2 #8 AWG & 1 #8 AWG GND IN 1-1/2" CONDUIT FOR THE FOLLOWING 120V FEEDER CIRCUITS: OFF LOADING MOTOR HEATER, LIGHTING CIRCUIT, AIR ELIMINATOR, SCULLY SYSTEM
4. 4 #3 AWG & 1 #4 AWG GND IN 1-1/2" CONDUIT FOR 480V 3ϕ OFF LOAD PUMP FEEDER CIRCUIT
5. (4) 3 #12 AWG EFSO CONTROL CIRCUITS IN 1" CONDUIT FOR: OFF LOADING PUMP MOTOR STARTER, EFSO PUSH BUTTON #2, EFSO PUSH BUTTON AND MOV #2 SHUNT TRIP
6. (2) 3 #12 AWG EFSO CONTROL CIRCUITS IN 1" CONDUIT FOR OFF LOADING PUMP MOTOR STARTER AND EFSO PUSH BUTTON #2
7. (3) 3 #12 AWG EFSO CONTROL CIRCUITS IN 1" CONDUIT FOR EXISTING FACP TIE-IN, EXISTING MOV #1 AND PANEL "F" SHUNT TRIP CIRCUIT BREAKER.
8. (2) 3 #12 AWG EFSO CONTROL CIRCUITS IN 1" CONDUIT FOR EXISTING FACP TIE-IN AND EXISTING MOVE #1
9. (1) 3 #12 AWG EFSO CONTROL CIRCUIT IN 3/4" FOR EXISTING FACP TIE-IN IN 3/4" CONDUIT
10. (1) 3 #12 AWG EFSO CONTROL CIRCUIT IN 3/4" CONDUIT FOR EXISTING MOVE #1
11. (1) 3 #12 AWG EFSO CONTROL CIRCUIT IN 3/4" CONDUIT FOR 120/208V PANELBOARD "F" SHUNT TRIP BREAKER

LUMINAIRE REQUIREMENTS:

1. HOUSING - DIE CAST ALUMINUM WITH INTEGRAL PASSIVE COOLING MECHANISM. HEAT SINK SHALL BE INCORPORATED DIRECTLY INTO HOUSING TO ENSURE MAXIMUM HEAT TRANSFER AND DISSIPATION.
2. FINISH - MULTI-STAGE PRE-TREATMENT, FINISHED WITH BAKED-ON POLYESTER POWDER COAT. FINISH SHALL PASS 2500 HOUR SALT SPRAY TEST PER ASTM B117. DARK BRONZE FINISH COLOR IS STANDARD.
3. POWER SUPPLY/LED DRIVER - CLASS 1 ELECTRONIC DRIVER SHALL OPERATE AT 120/277 VOLTS, 50/60 HZ, WITH OTHER VOLTAGES OPTIONAL. POWER FACTOR SHALL BE GREATER THAN 0.9 AND THD LESS THAN 20% AT FULL LOAD. MINIMUM EFFICACY SHALL BE 60 LM/W AT MAXIMUM 600mA OPERATING CURRENT.
4. LED OPTICAL ASSEMBLY - MULTI-LED ARRAY OPTIMIZED FOR SPECIFIC DISTRIBUTION PATTERN AS INDICATED. MINIMUM COLOR RENDERING INDEX (CRI) OF 70 FOR CORRELEATED COLOR TEMPERATURE OF 4000-4500 DEGREES K.
5. LENS - TEMPERED GLASS IN DIE-CAST ALUMINUM FRAME WITH SILICONE GASKET.
6. SURGE PROTECTION - 6 KV MINIMUM, COMPLIANT WITH ANSI C62.41.2.
7. CERTIFICATION - UL AND/OR ETL LISTED FOR WET LOCATIONS AND 2G VIBRATION STANDARD PER ANSI C136.32. OPTICAL ASSEMBLY SHALL BE MINIMUM IP65 PER ANSI/IEC 60529.
8. OPTIONS - PHOTOCELL, FINISH COLOR, OUTPUT DISTRIBUTION TYPE AND TRUNNION OR SLIPFITTER TYPE MOUNTING.
9. OTHER - THE ABOVE SKETCH IS A NON-PROPRIETARY GRAPHIC REPRESENTATION OF A LUMINAIRE THAT MAY MEET THE SPECIFICATION REQUIREMENTS AND IS NOT INTENDED TO INDICATE A CERTAIN MANUFACTURER'S PREFERENCE. ALL DIMENSIONS ARE NOMINAL AND VARY PER MANUFACTURER.

CONTROLS WIRING DIAGRAMS I

SHEET IDENTIFICATION NUMBER
E-602

SEQUENCE OF OPERATIONS

1. WHEN THE RESET BUTTON IS ACTIVATED (ASSUMING THAT ALL EFSO PUSHBUTTON STATIONS ARE IN THE DEACTIVATED STATE):
   - A. THE EFSO RELAY IS ENERGIZED.
   - B. THE "SYSTEM ON" GREEN PILOT LIGHT IS ENERGIZED.
   - C. THE N.O. EFSO HOLDING CONTACT (EFSO-1) WILL CLOSE AND INTERLOCK THE EFSO SYSTEM.
   - D. THE N.C. EFSO CONTACT (EFSO-2) WILL OPEN AND TURN-OFF THE "EFSO ACTIVATION LIGHT."
   - E. THE N.C EFSO CONTACT (EFSO-3) WILL OPEN AND TURN-OFF THE "ALARM HORN".
2. WHEN AN EMERGENCY OCCURS, AN EFSO PUSH BUTTON STATION IS ACTIVATED:
   - A. THE EFSO RELAY WILL BE DE-ENERGIZED.
   - B. THE N.O. EFSO CONTACT (EFSO-1) WILL OPEN.
   - C. THE N.C. EFSO CONTACT (EFSO-2) WILL CLOSE AND TURN-ON THE "EFSO ACTIVATION LIGHT."
   - D. THE N.C. EFSO CONTACT (EFSO-3) WILL CLOSE AND TURN-ON THE "ALARM HORN".
   - E. THE N.C. EFSO CONTACT (EFSO-4) WILL CLOSE AND SHUT THE HANGER BUILDING MOV #1.
   - F. THE N.O. EFSO CONTACT (EFSO-5) WILL CLOSE GENERATING EFSO ALARM CONDITION INPUT TO THE FIRE ALARM CONTROL PANEL (FACP).
   - G. THE N.O. EFSO CONTACT (EFSO-6) WILL OPEN AND STOP THE FUEL OFFLOAD PUMP. REFER TO SHEET E-604, "TYPICAL OFFLOAD PUMP WIRING DIAGRAM".
   - C. THE N.C. EFSO CONTACT (EFSO-7) WILL CLOSE AND ENERGIZE THE SHUNT TRIP RELAY AND SHUT DOWN THE POWER TO PANEL "F" AND THE OFFLOAD PUMP.
   - E. THE N.C. EFSO CONTACT (EFSO-8) WILL CLOSE AND SHUT MOV #2.
3. WHEN THE ALARM SILENCE BUTTON, ABS, IS ACTIVATED:
   - A. THE ASR RELAY IS ENERGIZED.
   - B. THE N.O. ASR HOLDING CONTACT (ASR-2) WILL CLOSE AND INTERLOCK THE ASR SYSTEM.
   - C. THE N.C. ASR CONTACT (ASR-1) WILL OPEN AND TURN-OFF THE "ALARM HORN".
4. WHEN THE BYPASS KEY SWITCH IS ACTIVATED:
   - A. THE BYPASS RELAY IS ENERGIZED.
   - B. THE BYPASS PILOT LIGHT IS ENERGIZED.
   - C. THE N.C. BYPASS CONTACT WILL OPEN AND DE-ENERGIZE THE SHUNT TRIP RELAY AND PREVENT RE-ACTIVATION OF THE SHUNT TRIP RELAY. THE USER WILL HAVE TO MANUALLY RESET THE SHUNT TRIPPED CIRCUIT BREAKER FOR PANEL "F" TO RESTORE PUMP POWER.
   - D. THE N.O. BYPASS CONTACT WILL CLOSE AND PROVIDE POWER TO RE-ENERGIZE THE SHUNT TRIP RELAY AND PREVENT FURTHER DE-ACTIVATION OF THE SHUNT TRIP RELAY. THE USER WILL HAVE TO MANUALLY RESET THE SHUNT TRIPPED CIRCUIT BREAKER FOR PANEL "F" AND THE SHUNT TRIPPED CIRCUIT BREAKER FOR THE OFFLOAD PUMP.

DESCRIPTION OF PROPERTY SURVEYED
(Per Ramsey County Tax Information)

A portion of Lot 12, Section 5, Township 28, Range 22, Ramsey County, Minnesota.

SURVEY REPORT

1. The purpose of this survey is to show partial topography and existing improvements for the requested area of the property. No boundary work was performed for this survey.
2. The address is 206 Airport Road W., St. Paul, Minnesota.
3. Benchmark: Holman MnDOT Monument GSID Station No. 25068. Located west of the north end of Airport Road. Elevation = 711.22 ft. (NAVD 88)
   Site Benchmarks:
   Control Point 7: Elevation = 699.61 ft. (NAVD 88)
   Control Point 8: Elevation = 714.80 ft. (NAVD 88)
4. We have shown underground utilities on and/or serving the surveyed property per field location.

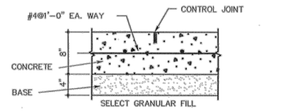
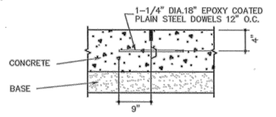
UNSTABLE OR WET CONDITIONS

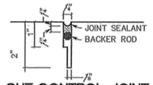
STORM SEWER BEDDING



TYPICAL PAVEMENT SECTION DETAIL



KEYED JOINT DETAIL



SAW-CUT CONTROL JOINT DETAIL

FORMED GROOVE CONSTRUCTION JOINT DETAIL

1. Concrete shall have a minimum compressive strength of 4000 PSI at 28 days and also meet the following criteria:

Cement	Type I, Normal Portland
Air Content	4% to 6% by volume
Water/Cement Ratio	0.50 max.
Maximum Aggregate Size	1-1/2 inch
Cement Content	520 lbs./Cu. Yd. min.

2. Concrete mix designs shall be proportioned in accordance with ACI 301. Mix designs shall be prepared by an independent testing agency acceptable to the engineer.

   Compressive strength of the concrete shall be verified by concrete cylinder tests taken from trial batches. The contractor shall provide descriptive data for all materials and admixtures used in the proposed concrete mixes.

   All test data and information shall be submitted to the engineer for approval prior to delivering any concrete to the project.

3. Reinforcing bars shall be ASTM A615 GR. 60. Reinforcement Fabric shall be placed at mid-depth of the slab and extend to within six inches of slab edges or construction joints. Reinforcement shall be continuous through control joints.

4. Control joints shall be spaced at 15'-0" maximum in each direction. Saw cuts shall be made no more than 24 hours after the pour.

5. Construction joints shall be located no more than 15 feet from parallel control joints. Mandatory construction joints are shown on plan. Otherwise, construction joints shall be provided at the edge of pours or where placement of concrete will be temporarily suspended for 1-1/2 hours or more.

6. Joint sealant shall be polyurethane based, multi-component, self-curing, self-leveling type. Acceptable manufactures are Mameco, Sika, Sonneborn or Tremco.

7. "Borrow material shall not consist of recycled material. Source must be approved by the Engineer. Granular borrow and topsoil borrow shall conform with the following Minnesota DOT Specifications."

EDR PUR-IQ® Report

"the intelligent way to conduct historical research"

for
Holman Field
206 Airport Road
Saint Paul, MN 55107
Lat./Long. 44.939868 / 93.069707
EDR Inquiry # 5454377.2s

The EDR PUR-IQ report facilitates historical research planning required to complete the Phase I ESA process. The report identifies the *likelihood* of prior use coverage by searching proprietary EDR-Prior Use Reports® comprising nationwide information on: city directories, fire insurance maps, aerial photographs, historical topographic maps, flood maps and National Wetland Inventory maps.

Potential for EDR Historical (Prior Use) Coverage - Coverage in the following historical information sources may be used as a guide to develop your historical research strategy:

1. Building Permits: Building Permits are available for 'SAINT PAUL', MN (1991 - 2017).

2. City Directory: Coverage may exist for portions of Ramsey County, MN.

3. Fire Insurance Map: When you order online any EDR Package or the EDR Radius Map with EDR Sanborn Map Search/Print, you receive site specific Sanborn Map coverage information at no charge.

4. Aerial Photograph: Coverage exists for portions of Ramsey County for the following decades: 1940s, 1950s, 1980s, 1990s, 1930s, 1960s, 1970s Shipping time 3-5 business days.

5. Topographic Map: The USGS 7.5 min. quad topo sheet(s) associated with this site:

Historical: Coverage exists for RAMSEY County

Current: Target Property: TP | 2013 | 5964255 Saint Paul East, MN

6. Flood Prone Maps : Coverage is available for Ramsey County

7. NWI Wetland Maps: Coverage exists for Ramsey County

EDR's network of professional researchers, located throughout the United States, accesses the most extensive national collections of city directory, fire insurance maps, aerial photographs, wetland map resources and historical topographic map resources available for Saint Paul, MN. These collections may be located in multiple libraries throughout the country. To ensure maximum coverage, EDR will often assign researchers at these multiple locations on your behalf. Please call or fax your EDR representative to authorize a search.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by AECOM were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # B355-40DF-81AE

PO # NA

Project Holman Field

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: B355-40DF-81AE

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

AECOM (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

206 AIRPORT ROAD
SAINT PAUL, MN 55107

COORDINATES

Latitude (North):	44.9398680 - 44° 56' 23.52''
Longitude (West):	93.0697070 - 93° 4' 10.94''
Universal Tranverse Mercator:	Zone 15
UTM X (Meters):	494500.1
UTM Y (Meters):	4976056.0
Elevation:	700 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/17/2018 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are

8 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

MN SHWS: The Superfund Site Information Listing records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Minnesota Pollution Control's Superfund Permanent List of Priorities.

A review of the MN SHWS list, as provided by EDR, and dated 06/01/2018 has revealed that there are 3 MN SHWS sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

MN SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Minnesota Pollution Control's Permitted Solid Waste Disposal Facilities list.

A review of the MN SWF/LF list, as provided by EDR, and dated 08/02/2018 has revealed that there is 1

MN SWF/LF site within approximately 0.5 miles of the target property.

State and tribal Brownfields sites

MN BROWNFIELDS: Purchasing, selling, or developing property can present a special set of obstacles if the property is contaminated with chemicals. The Petroleum Brownfields Program is one of several programs within the Minnesota Pollution Control Agency (MPCA) designed to help people address these obstacles. The purpose of the Petroleum Brownfields Program is to provide the technical assistance and liability assurance needed to expedite and facilitate the development, transfer, investigation and/or cleanup of property that is contaminated with petroleum.

A review of the MN BROWNFIELDS list, as provided by EDR, and dated 08/24/2018 has revealed that there are 42 MN BROWNFIELDS sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: The EPA's listing of Brownfields properties from the Cleanups in My Community program, which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

A review of the US BROWNFIELDS list, as provided by EDR, and dated 06/18/2018 has revealed that there is 1 US BROWNFIELDS site within approximately 0.5 miles of the target property.

MN DEL PLP: This generally means that either no more cleanup at a site is needed or that no state superfund funding is needed for long term monitoring activities.

A review of the MN DEL PLP list, as provided by EDR, and dated 08/24/2018 has revealed that there are 2 MN DEL PLP sites within approximately 1 mile of the target property.

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 12 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

MN WIMN: Since 2003, the PCA's "What's in My Neighborhood?" database provides information about air quality, hazardous waste, remediation, solid waste, tanks and leaks, and water quality around Minnesota.

A review of the MN WIMN list, as provided by EDR, and dated 07/07/2018 has revealed that there are 120 MN WIMN sites within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within approximately 1 mile of the target property.

Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Site 8 of 17 in cluster A

Actual:
700 ft.

FINDS:

Registry ID: 110003794234

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D000
. Waste name: Not Defined

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D008
. Waste name: LEAD

. Waste code: X001
. Waste name: WASTE OILS

Violation Status: No violations found

RCRA-CESQG:

Date form received by agency:	04/16/1992
Facility name:	FEDERAL EXPRESS CORP - ST PAUL
Facility address:	261 CHESTER ST ST. PAUL, MN 55107
EPA ID:	MND985738780
Contact:	BARBARA HENNING
Contact address:	261 CHESTER ST ST. PAUL, MN 55107
Contact country:	US
Contact telephone:	651-291-7747
Contact email:	Not reported
EPA Region:	05
Classification:	Conditionally Exempt Small Quantity Generator
Description:	Handler: generates 100 kg or less of hazardous waste per calendar month, and accumulates 1000 kg or less of hazardous waste at any time; or generates 1 kg or less of acutely hazardous waste per calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely

FEDERAL EXPRESS CORP - ST PAUL (Continued) **1004733058**

hazardous waste during any calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste

Owner/Operator Summary:

Owner/operator name:	FEDERAL EXPRESS CORP
Owner/operator address:	2005 CORPORATE AVE MEMPHIS, TN 38132
Owner/operator country:	US
Owner/operator telephone:	651-291-7747
Owner/operator email:	Not reported
Owner/operator fax:	Not reported
Owner/operator extension:	Not reported
Legal status:	Private
Owner/Operator Type:	Operator
Owner/Op start date:	10/14/1999
Owner/Op end date:	Not reported

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

. Waste code: D000
. Waste name: Not Defined

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE

FEDERAL EXPRESS CORP - ST PAUL (Continued) **1004733058**

DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D008
. Waste name: LEAD

. Waste code: D039
. Waste name: TETRACHLOROETHYLENE

Violation Status: No violations found

Historical Generators:
Date form received by agency: 03/19/1998
Site name: VERSACOLD USA INC
Classification: Conditionally Exempt Small Quantity Generator

. Waste code: D000
. Waste name: Not Defined

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D009
. Waste name: MERCURY

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

FINDS:

Registry ID: 110003779661

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
