RL - Reporting limit

LCL-UCL- Lower control limit - upper control limit
Results reported to RL.
When reported, PFHxS, PFOA and PFOS include both linear and branched isomers.
Only the linear isomer is reported for all other analytes.

DATA QUALIFIERS & ABBREVIATIONS

B	**This compound was also detected in the method blank.**
D	**Dilution**
E	**The associated compound concentration exceeded the calibration range of the instrument.**
H	**Recovery and/or RPD was outside laboratory acceptance limits.**
I	**Chemical Interference**
J	**The amount detected is below the Reporting Limit/LOQ.**
M	**Estimated Maximum Possible Concentration. (CA Region 2 projects only)**
*****	**See Cover Letter**
Conc.	**Concentration**
NA	**Not applicable**
ND	**Not Detected**
TEQ	**Toxic Equivalency**
U	**Not Detected (specific projects only)**

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

Vista Work Order No. 1701392

Ms. Ashleigh Fines
Apex Companies, LLC
3015 SW First Avenue
Portland, OR 97201

Dear Ms. Fines,

Enclosed are the results for the sample set received at Vista Analytical Laboratory on October 04, 2017. This sample set was analyzed on a standard turn-around time, under your Project Name 'PDX Fire Training Facility'.

Vista Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at mmaier@vista-analytical.com.

Thank you for choosing Vista as part of your analytical support team.

Sincerely,

Karen J. Volpendesta for

Martha Maier
Laboratory Director

Vista Analytical Laboratory certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Vista.

Vista Work Order No. 1701392
Case Narrative

Sample Condition on Receipt:

One soil sample was received in good condition and within the method temperature requirements. The sample was received and stored securely in accordance with Vista standard operating procedures and EPA methodology.

Analytical Notes:

Modified EPA Method 537

The sample was extracted and analyzed for a selected list of PFAS using Modified EPA Method 537. The results for PFHxS, PFOA and PFOS include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The sample was extracted and analyzed within the method hold times.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected in the Method Blank above the Reporting Limit. The percent recovery in the OPR for PFTrDA was above the acceptance limit at 139%; this analyte was not detected in the sample. All other OPR recoveries were within the method acceptance criteria.

The labeled standard recoveries outside the acceptance criteria are listed in the table below.

QC Anomalies

LabNumber	SampleName	Analysis	Analyte	Flag	%Rec
B7J0080-BLK1	B7J0080-BLK1	VAL - PFAS	13C2-PFUnA	H	52.2

H = Recovery was outside laboratory acceptance criteria.

RL - Reporting limit

LCL-UCL- Lower control limit - upper control limit
The results are reported in dry weight.
The sample size is reported in wet weight.
Results reported to RL.
When reported, PFHxS, PFOA and PFOS include both linear and branched isomers.
Only the linear isomer is reported for all other analytes.

Sample ID: OPR **VAL - PFAS**

NELAP Accredited Test Methods

MATRIX: Air	
Description of Test	**Method**
Determination of Polychlorinated p-Dioxins & Polychlorinated Dibenzofurans	EPA 23

MATRIX: Biological Tissue	
Description of Test	**Method**
Tetra- through Octa-Chlorinated Dioxins and Furans by Isotope Dilution GC/HRMS	EPA 1613B
Brominated Diphenyl Ethers by HRGC/HRMS	EPA 1614A
Chlorinated Biphenyl Congeners in Water, Soil, Sediment, and Tissue by GC/HRMS	EPA 1668A/C
Pesticides in Water, Soil, Sediment, Biosolids, and Tissue by HRGC/HRMS	EPA 1699
Perfluorinated Alkyl Acids in Drinking Water by SPE and LC/MS/MS	EPA 537
Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans by GC/HRMS	EPA 8280A/B
Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) by GC/HRMS	EPA 8290/8290A

MATRIX: Drinking Water	
Description of Test	**Method**
2,3,7,8-Tetrachlorodibenzo- p-dioxin (2,3,7,8-TCDD) GC/HRMS	EPA 1613
Perfluorinated Alkyl Acids in Drinking Water by SPE and LC/MS/MS	EPA 537

MATRIX: Non-Potable Water	
Description of Test	**Method**
Tetra- through Octa-Chlorinated Dioxins and Furans by Isotope Dilution GC/HRMS	EPA 1613B
Brominated Diphenyl Ethers by HRGC/HRMS	EPA 1614A
Chlorinated Biphenyl Congeners in Water, Soil, Sediment, and Tissue by GC/HRMS	EPA 1668A/C
Pesticides in Water, Soil, Sediment, Biosolids, and Tissue by HRGC/HRMS	EPA 1699
Perfluorinated Alkyl Acids in Drinking Water by SPE and LC/MS/MS	EPA 537
Dioxin by GC/HRMS	EPA 613
Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans by GC/HRMS	EPA 8280A/B
Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) by GC/HRMS	EPA 8290/8290A

MATRIX: Solids	
Description of Test	**Method**
Tetra-Octa Chlorinated Dioxins and Furans by Isotope Dilution GC/HRMS	EPA 1613
Tetra- through Octa-Chlorinated Dioxins and Furans by Isotope	EPA 1613B

Dilution GC/HRMS	
Brominated Diphenyl Ethers by HRGC/HRMS	EPA 1614A
Chlorinated Biphenyl Congeners in Water, Soil, Sediment, and Tissue by GC/HRMS	EPA 1668A/C
Perfluorinated Alkyl Acids in Drinking Water by SPE and LC/MS/MS	EPA 537
Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans by GC/HRMS	EPA 8280A/B
Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) by GC/HRMS	EPA 8290/8290A

Vista Work Order No. 1701412

Ms. Ashleigh Fines
Apex Companies, LLC
3015 SW First Avenue
Portland, OR 97201

Dear Ms. Fines,

Enclosed are the results for the sample set received at Vista Analytical Laboratory on October 05, 2017. This sample set was analyzed on a standard turn-around time, under your Project Name 'PDX Fire Training Facility'.

Vista Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at mmaier@vista-analytical.com.

Thank you for choosing Vista as part of your analytical support team.

Sincerely,

Karen J. Volpendesta for

Martha Maier
Laboratory Director

Vista Analytical Laboratory certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Vista.

Vista Work Order No. 1701412
Case Narrative

Sample Condition on Receipt:

Three groundwater samples and two soil samples were received in good condition and within the method temperature requirements. The samples were received and stored securely in accordance with Vista standard operating procedures and EPA methodology.

Analytical Notes:

Modified EPA Method 537/VAL-PFAS

The samples were extracted and analyzed for a selected list of PFAS using Modified EPA Method 537. The results for PFHxS, PFOA and PFOS include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The samples were extracted and analyzed within the method hold times.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected in the Method Blank above the Reporting Limit. The OPR recoveries were within the method acceptance criteria.

The labeled standard recoveries outside the acceptance criteria are listed in the table below.

QC Anomalies

LabNumber	SampleName	Analysis	Analyte	Flag	%Rec
B7J0160-BLK1	B7J0160-BLK1	VAL - PFAS	13C2-PFUnA	H	58.0
B7J0160-BLK1	B7J0160-BLK1	VAL - PFAS	13C2-PFTeDA	H	15.7
B7J0160-BS1	B7J0160-BS1	VAL - PFAS	13C2-PFTeDA	H	13.8

H = Recovery was outside laboratory acceptance criteria.

RL - Reporting limit

LCL-UCL- Lower control limit - upper control limit
Results reported to RL.

When reported, PFHxS, PFOA and PFOS include both linear and branched isomers.
Only the linear isomer is reported for all other analytes.

RL - Reporting limit

LCL-UCL- Lower control limit - upper control limit
Results reported to RL.

When reported, PFHxS, PFOA and PFOS include both linear and branched isomers.
Only the linear isomer is reported for all other analytes.

RL - Reporting limit

LCL-UCL- Lower control limit - upper control limit
The results are reported in dry weight.
The sample size is reported in wet weight.
Results reported to RL.

When reported, PFHxS, PFOA and PFOS include both linear and branched isomers.
Only the linear isomer is reported for all other analytes.

Sample ID: B-M-2 (9.5-10)

VAL - PFAS

Qualifiers

LCMS

Qualifier	Qualifier Description
*	Isotope Dilution analyte is outside acceptance limits.
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 320-32175-1

Laboratory: TestAmerica Sacramento

Narrative

Job Narrative
320-32175-1

Receipt
The sample was received on 10/5/2017 10:10 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.6º C.

LCMS
Method(s) 537 (modified): The labeled analyte M2-4:2FTS is employed in this analysis as a "Reverse Surrogate". It is used to monitor the oxidation efficiency of the TOP assay. This compound is fortified into all sample fractions prior to any processing. The recovery of this compound should be close to 100% in Pre-Treatment fractions, as this fraction is not oxidized, and 0% in Post-Treatment fractions, indicating complete oxidation of the sample.

Method(s) 537 (modified): The compound M2-4:2FTS is converted to PFBA during the oxidation step of the TOP assay. The Post-Treatment method blank's PFBA result indicates roughly how much of any field sample's Post-Treatment PFBA result is contributed by the oxidation process.

Method(s) 537 (modified): The oxidation process converts precursor PFAS compounds to end product PFCA (Per or Poly-fluorinated carboxylic acids). As the LCS/LCSD associated to this data set was fortified with precursor PFAS compounds their conversion to PFCA is demonstrated by zero recovery of these compounds (6:2 FTS, 8:2 FTS, FOSA, MeFOSAA and EtFOSAA) yet enhanced recoveries of PFCA relative to the pre-oxidation LCS/LCSD results.

Method(s) 537 (modified): Due to the sporadic recovery performance for the labeled analyte 13C8-FOSA, we are temporarily increasing the reporting limit (RL) for the target analyte FOSA in order to provide better confidence in its reported value. The RL for FOSA has been increased so the same concentration as that fortified into the laboratory control sample (LCS). At this concentration, the LCS demonstrates acceptable FOSA recovery regardless of the recovery of it labeled analog, 13C8-FOSA, which is used to quantitate FOSA. Thus, indicating sufficient analytical performance to support this RL increase. Techniques to improve the recovery performance of 13C8-FOSA are currently underway.

Method(s) 537 (modified): The Isotope Dilution Analyte (IDA) recovery associated with the following samples is below the method recommended limit for 13C8 FOSA: MW-4 (320-32175-1) and (MB 320-188740/1-A). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the samples.

Method(s) 537 (modified): The method blank for preparation batch 320-188740 and analytical batch 320-191243 contained Perfluorobutanoic acid (PFBA) above the reporting limit. This target analyte concentration was greater than 10x the blank concentration; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method(s) TOPS Post Prep: Due to expected high levels sample MW-4 (320-32175-1) was measured out at 1.00 mL and diluted to 100.00 mL with reagent water for extraction.
Batch; 188740
TOPS_Post_Prep
Aqueous

Method(s) TOPS Pre - Prep: Due to expected high levels sample MW-4 (320-32175-1) was measured out at 1.00 mL and diluted to 100.00 mL with reagent water for extraction.
Batch: 188738
TOPS_Pre_Prep
Aqueous

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Vista Work Order No. 1701147

Ms. Ashleigh Fines
Apex Companies, LLC
3015 SW First Avenue
Portland, OR 97201

Dear Ms. Fines,

Enclosed are the results for the sample set received at Vista Analytical Laboratory on August 25, 2017. This sample set was analyzed on a standard turn-around time, under your Project Name '2333-02'.

Vista Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at mmaier@vista-analytical.com.

Thank you for choosing Vista as part of your analytical support team.

Sincerely,

Martha Maier
Laboratory Director

Vista Analytical Laboratory certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Vista.

Vista Work Order No. 1701147
Case Narrative

Sample Condition on Receipt:

One water sample was received in good condition and within the method temperature requirements. The sample was received and stored securely in accordance with Vista standard operating procedures and EPA methodology.

Analytical Notes:

Modified EPA Method 537

The sample was extracted and analyzed for a selected list of 14 PFAS using Modified EPA Method 537. The results for PFHxS, PFOA and PFOS include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The sample was extracted and analyzed within the method hold times. The sample was re-extracted and the extract was concentrated to a lower volume to reach a Reporting Limit of 1.05 ng/L. The re-extract was performed outside the hold time.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with each preparation batch. No analytes were detected in the Method Blanks above the Reporting Limits. The OPR recoveries were within the method acceptance criteria.

The recoveries of all internal standards in the QC and field samples were within the acceptance criteria.

DATA QUALIFIERS & ABBREVIATIONS

B	**This compound was also detected in the method blank.**
D	**Dilution**
E	**The associated compound concentration exceeded the calibration range of the instrument.**
H	**Recovery and/or RPD was outside laboratory acceptance limits.**
I	**Chemical Interference**
J	**The amount detected is below the Reporting Limit/LOQ.**
M	**Estimated Maximum Possible Concentration. (CA Region 2 projects only)**
*****	**See Cover Letter**
Conc.	**Concentration**
NA	**Not applicable**
ND	**Not Detected**
TEQ	**Toxic Equivalency**
U	**Not Detected (specific projects only)**

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

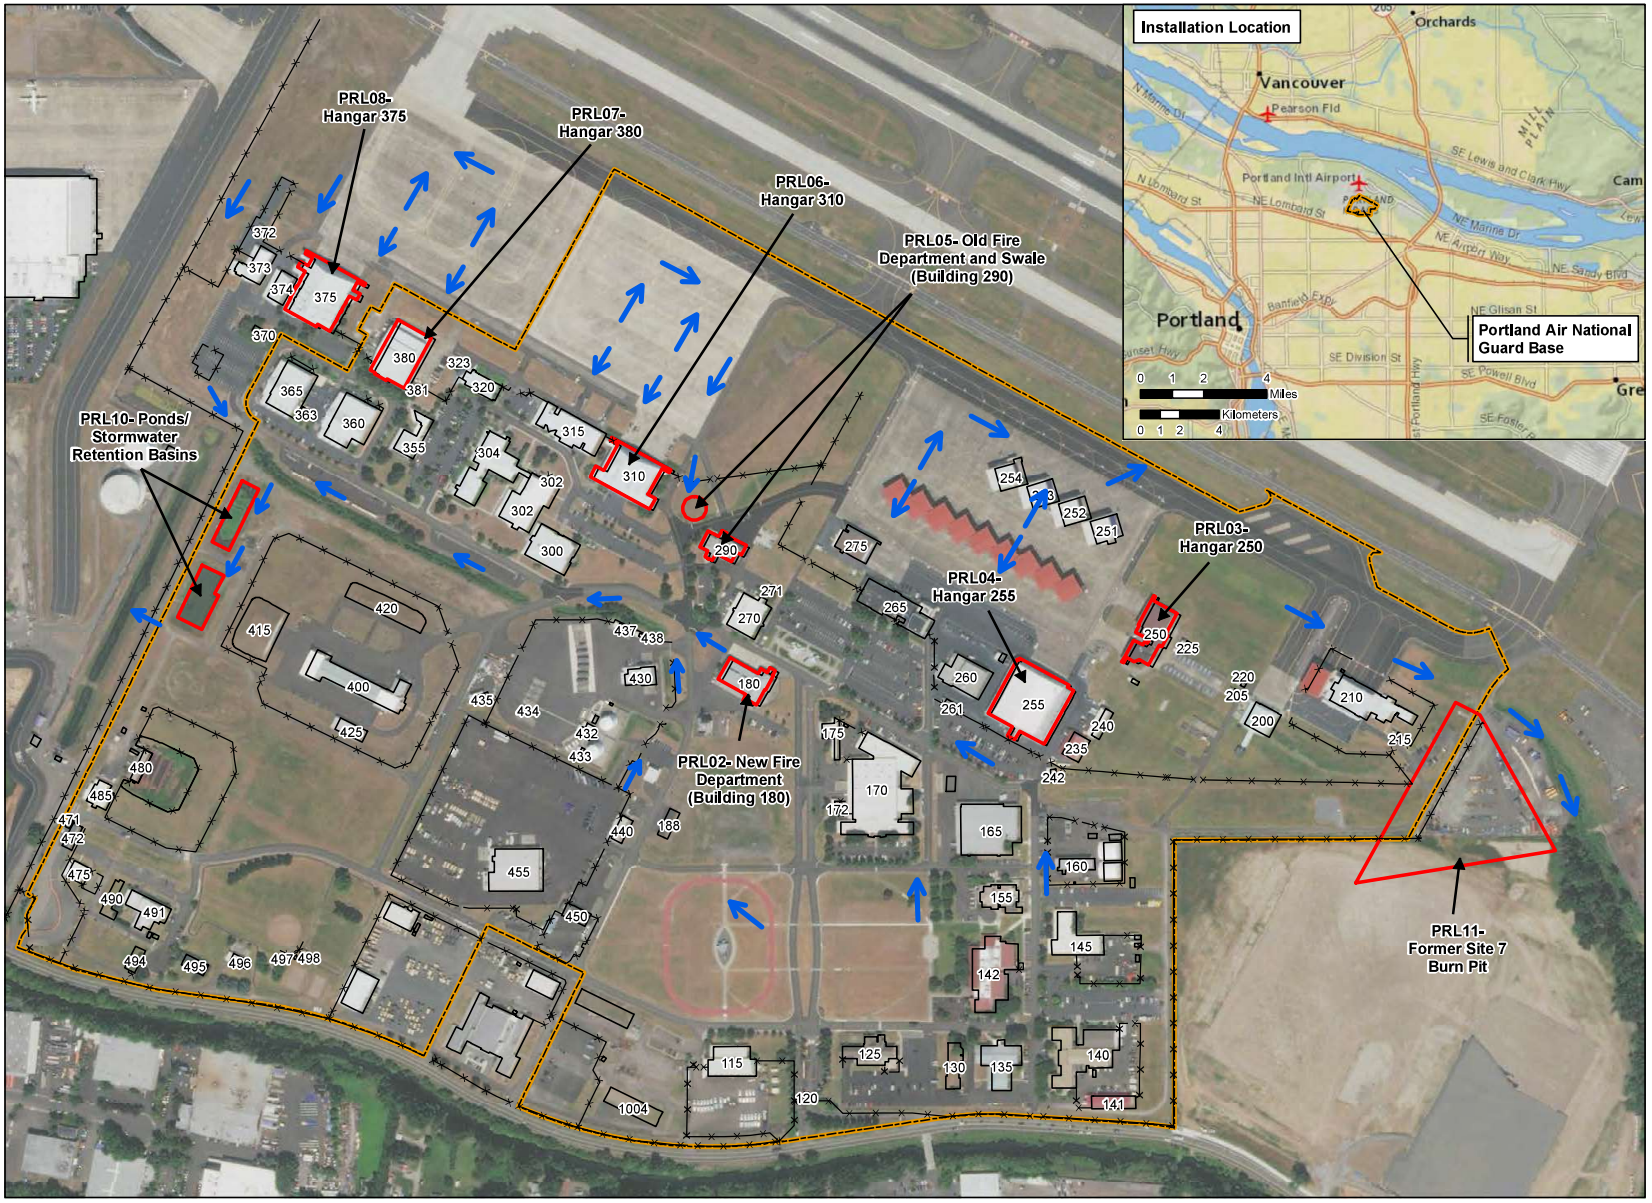
1.0 INTRODUCTION

Leidos was contracted by the National Guard Bureau (NGB) to conduct site inspections (SIs) for perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA) at multiple Air National Guard (ANG) Installations. The scope of work at the Portland ANG at Portland International Airport (PDX), Portland, Oregon, herein referred to as Portland Air National Guard Base (ANGB), includes preparation of this Work Plan (WP) to conduct an SI at potential release locations (PRLs) identified at Portland ANGB. This SI WP defines the procedures and strategies for sample collection to determine the presence or absence of PFOS and PFOA in environmental media at the PRLs on Base identified during the preliminary assessment (PA) (BB&E 2016). Sampling will only be performed on the Port of Portland currently being leased by ANG (with the exception of Hangar 375 and Former Installation Restoration Program (IRP) Site 7 Burn Pit). Figure 1-1 presents the Installation location and locations of the PRLs at Portland ANGB. Leidos has prepared this SI WP to satisfy the requirements of Task Order 0011 of NGB Contract Number W9133L-14-D-0007. Project management and quality control (QC) procedures are documented in the Quality Control Plan for Fiscal Year 2017 Phase III Regional Site Inspections for Perfluorinated Compounds at Multiple Air National Guard Installations (Leidos 2017a). An Installation kickoff meeting was held with the project stakeholders on September 6, 2017, and the meeting minutes were submitted on October 6, 2017 (Leidos 2017b).

1.1 PROJECT OBJECTIVES AND SCOPE

An SI will be conducted for each of the PRLs to determine the presence or absence of PFOS/PFOA in surface and subsurface soil, groundwater, and sediment and surface water (sampled media at each PRL will be dependent on the type of PRL); determine if contaminated groundwater has reached the Base boundary; and provide a defensible no further action (NFA) decision, development of data quality objectives (DQOs) for follow-on remedial investigation (RI) activities for PRLs not meeting the NFA criteria, or an interim response action if appropriate.



The scope of work consists of four inter-related tasks: (1) prepare an SI WP, (2) conduct SI and data collection activities, (3) conduct data validation and laboratory oversight activities, and (4) evaluate data from the field effort and applicable historical information to produce an SI Report.

Laboratory analyses will be conducted in accordance with project quality assurance (QA)/QC requirements, as specified in the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) (Appendix A). The field activities will follow site-specific sampling and health and safety protocols, as identified in the Site Safety and Health Plan (SSHP) (Appendix B). All SI activities will be conducted using established methodologies under U.S. Environmental Protection Agency (EPA) protocols for PFOS/PFOA investigations and meet laboratory reporting requirements. SI activities also will be conducted in accordance with the Supporting Technical Information provided in Attachment 1 of the *Air Force Interim Guidance on Perfluorinated Compounds* (U.S. Air Force [USAF] 2012), *SAF/IE Policy on Perfluorinated Compounds (PFCs) of Concern* (USAF 2016), and the *Air National Guard Environmental Restoration Program Investigation Guidance* (ANG 2009).

1.2 REGULATORY FRAMEWORK

The U.S. Department of Defense (DoD) prefers to conduct environmental restoration activities under the framework established by the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) when possible because the CERCLA process satisfies the objectives of most cleanup programs: protect human health and the environment, include the public in the decision-making process, and attain environmental restoration objectives (DoD 2012). Under the CERCLA framework, the first two phases of investigation for observed and/or potential sources of contamination are the PA and SI.

THIS PAGE INTENTIONALLY LEFT BLANK.

PFOS/PFOA are emerging contaminants that have not historically been analyzed during site characterization activities; for that reason, minimal sampling data exist for most sites. Currently, no legally enforceable federal standards exist for PFOS/PFOA in water. However, under the Safe Drinking Water Act, EPA issued a series of health advisories (HAs) for PFOS/PFOA, as follows.

In 2009, EPA issued preliminary HA levels for PFOS (0.2 µg/L) and PFOA (0.4 µg/L).

In 2012, EPA published the third Unregulated Contaminant Monitoring Rule (UCMR3), which required public water supplies across the country to sample for a list of 30 unregulated contaminants, including 6 chemicals relevant to this SI (PFOS, PFOA, perfluorobutanesulfonate [PFBS], perfluorononanoic acid [PFNA], perfluoroheptanoic acid [PFHpA], and perfluorohexanesulfonate [PFHxS], collectively referred to as PFOS/PFOA herein). Results of UCMR3-required sampling indicated detections of these compounds at numerous locations, including several near DoD facilities. PFOS/PFOA detections at DoD facilities are often linked to the use of Aqueous Film-Forming Foam (AFFF), which may contain one or more of these chemicals. AFFF is a firefighting agent used to suppress fires involving petroleum hydrocarbons.

Samples collected during the SI will be analyzed for the six UCMR3 chemicals by EPA Method 537 revision 1.1, in accordance with the 2012 Air Force Interim Guidance and the *U.S. Department of Defense Quality Systems Manual for Environmental Laboratories*, Version 5.1 (DoD 2017). Analytical results for PFOS, PFOA, and PFBS will be compared to the screening levels presented in the following paragraphs. No screening levels are currently available for PFNA, PFHpA, and PFHxS.

In May 2016, EPA set a combined drinking water lifetime HA for PFOS and PFOA of 70 ng/L (replacing the 2009 values). This is the level below which adverse health effects are not anticipated to occur over a lifetime of exposure. For PFBS, the residential risk-based screening level for tap water from the November 2017 regional screening level (RSL) table is 400,000 ng/L.

There are also no legally enforceable federal standards for PFOS/PFOA in soil or sediment. Following the process utilized at other ANG Installations around the country, Leidos proposes using residential risk-based screening levels for soil determined using the EPA RSL calculator and the November 2017 RSL tables. The calculated screening levels are as follows:

- PFOS = 1,260 µg/kg;
- PFOA = 1,260 µg/kg; and
- PFBS = 1,260,000 µg/kg.

As of the preparation of this SI WP, no site-specific soil screening levels have been developed in Oregon. Furthermore, no surface water or sediment screening criteria have been established by EPA or the Oregon Department of Environmental Quality (ODEQ) at this time. Leidos will use the EPA 2016 drinking water lifetime HA levels (PFOS and PFOA) and residential risk-based screening level for tap water (PFBS) for groundwater and surface water screening and the residential risk-based soil screening levels determined using the EPA RSL calculator (https://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search) and the November 2017 EPA RSL tables (https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables-november-2017) for soil and sediment. The most current RSL values will be used as the screening levels in the SI Report.

THIS PAGE INTENTIONALLY LEFT BLANK.

2.0 INSTALLATION BACKGROUND INFORMATION

2.1 INSTALLATION DESCRIPTION

Portland ANGB is the home of the 142nd Fighter Wing (FW) in Portland, Oregon. Portland ANGB is located immediately adjacent and south of the PDX and occupies approximately 245 acres of land leased from the Port of Portland (Port) (BB&E 2016). PDX covers roughly 3,000 acres; has three runways; and is located 6 miles northeast of downtown Portland, Oregon in Multnomah County. The site location is shown in Figure 1-1.

2.2 HISTORY AND CURRENT OPERATIONS

PDX started as a municipal airport in the early 1940s. The 123rd Observation Squadron (OS) of Portland ANG was organized at the Portland-Columbia Airport on July 30, 1940, then renamed the 142nd FW when it deployed overseas during World War II. Post war, in 1950, most of the area currently occupied by Portland ANG was converted into an active U.S. Air Force Base, until Portland ANG resumed control again in 1964 (Hazardous Materials Technical Center [HMTC] 1987). Since the Base was established, Portland ANG has leased or occupied space within the PDX facility. Today, PDX is the busiest commercial airport for passenger and air cargo traffic in the State of Oregon. It is a civil-military airport that serviced roughly 18.3 million passengers in 2016. The 142nd FW is currently an air reserve component of the U.S. Air Force and flies F-15C/D Eagle fighters (ANG 2010a).

2.3 HISTORY OF CONTAMINATION

Base operations that could have contributed to contamination of soil, groundwater, sediment, and surface water include fire training areas (FTAs) and non-FTAs. FTA PRLs are sites where AFFF was likely used for fire suppression during training activities. Non-FTA PRLs are sites where AFFF was stored, released, and/or likely to have been released, such as crash sites, hangars, fuel spill areas, hazardous waste storage facilities, firefighting equipment testing areas, stormwater and/or surface water drainage features, outfalls, wastewater treatment plants, or AFFF ponds.

When AFFF is released to the environment, PFOS/PFOA can migrate into soil and groundwater. The amount of PFOS/PFOA that migrates to groundwater depends on the type and amount of AFFF used, where it was used, the type of soil, and other factors. PFOS/PFOA may migrate readily from soil to groundwater. As stated in Section 1.2, EPA has not established screening levels for PFOS/PFOA in soil. The primary exposure pathway for PFOS/PFOA is the ingestion of contaminated drinking water.

BB&E's *Perfluorinated Compounds Preliminary Assessment Site Visit Report, Portland Air National Guard, 142nd Fighter Wing, Portland, Oregon* (BB&E 2016) evaluated a total of 10 PRLs and recommended 9 of these for further investigation under an SI (Table 2-1). During the September 2017 site visit, stakeholder discussions resulted in deviation from the PA with respect to the PRLs being evaluated in the SI. It was determined that investigation at the POL Storage – Building 431 would be replaced with investigation at former IRP Site 7. No documentation was available showing that soil, groundwater, sediment, and surface water at Portland ANGB have been tested for PFOS/PFOA; therefore, these compounds could be present in media at any of these PRLs. The sections below briefly describe the operational history and waste characteristics of the PRLs, as presented in the PA Report. Some of the descriptions have been updated based on information obtained during the Installation site visit. PRL numbers correspond to the area of concern designation used in the PA Report.

Table 2-1. Preliminary Assessment Report Summary and Recommendations

No.	Potential AFFF PRL	Rationale	Recommendation
1	Base Supply – Building 170	The station has stored AFFF at this location for at least the past 10 years. According to Base personnel, no AFFF was spilled in the building.	NFA
2	New Fire Department – Building 180	FD personnel indicated that there were minor spills, which occurred during filling the vehicles over the years from onsite containers and minor leaks from the equipment. Additionally, at least three occurrences of AFFF being discharged to the stormwater sewer system were documented in the Annual Storm Water Reports.	Proceed to SI. Focus on groundwater.
3	Hangar 250	Minor leaks of AFFF have occurred in the mechanical room. There are no records of inadvertent releases in the hangar; however, if releases did occur, they may have potentially impacted the adjacent ramp.	Proceed to SI. Focus on soil and groundwater at the downgradient edges of the ramp based on surface drainage patterns.
4	Hangar 255	Minor leaks of AFFF have occurred in the mechanical room, with one inadvertent release in the main hangar. It is likely that most of the inadvertent release of AFFF was hosed off into the trench drain that connects to the sanitary sewer systems, with some of the AFFF making its way onto the ramp, and then into the storm sewer system.	Proceed to SI. Focus on soil and groundwater at the downgradient edges of the ramp based on surface drainage patterns.
5	Old Fire Department and Swale – Building 290	FD personnel indicated that there were minor spills, which occurred during filling the vehicles over the years from onsite containers and minor leaks from the equipment. Additionally, at least one occurrence of AFFF being discharged to the stormwater sewer system is documented in the Annual Storm Water Reports. Reports of AFFF making its way to the drainage swale also have been documented.	Proceed to SI. Focus on soil, sediment, surface water, and groundwater.
6	Hangar 310	Minor leaks of AFFF have occurred in the mechanical room, with an inadvertent release in the main hangar. It is likely that most of the inadvertent release of AFFF was hosed off into the trench drain that connects to the sanitary sewer systems, with some of the AFFF making its way onto the ramp, and then into the storm sewer system.	Proceed to SI. Focus on soil and groundwater at the downgradient edges of the ramp based on surface drainage patterns.
7	Hangar 380	AFFF was stored in fire suppression equipment in the mechanical room of Hangar 380. The fire suppression system's tanks are no longer present and were reportedly removed in 2005. There were no known discharges in the room or in the main hangar; however, if releases did occur, they may have potentially impacted the adjacent ramp.	Proceed to SI. Focus on soil and groundwater at the downgradient edges of the ramp based on surface drainage patterns.
8	Hangar 375	Minor leaks of AFFF have occurred in the mechanical room, with an inadvertent release in the main hangar. It is likely that most of the inadvertent release of AFFF was hosed off into the trench drain that connects to the sanitary sewer systems, with some of the AFFF making its way onto the ramp, and then into the storm sewer system.	Proceed to SI. Focus on soil and groundwater at the downgradient edges of the ramp based on surface drainage patterns.
9	POL Storage – Building 431	This building formerly contained the AFFF system tank that provided fire protection for the fuel tanks.	Proceed to SI. Focus on soil and groundwater.
10	Ponds/Storm Water Retention Basins	These two ponds receive 95% of the Base's stormwater discharges. All of the previously aforementioned releases to the stormwater system eventually made their way to these two ponds.	Proceed to SI. Focus on sediment, surface water, and groundwater.

AFFF = Aqueous film-forming foam.
NFA = No further action.
FD = Fire department.
SI = Site investigation.
POL = Petroleum, oils, and lubricants.
PRL = Potential release point.

2.3.1 Fire Training Areas

Based on the PA Report, there is no evidence that an FTA is or was located within the footprint of the Base's boundary. Portland ANG fire training was conducted from 1957 to 1978 at former IRP Site 7, which is currently PDX property (BB&E 2016). This location was previously investigated during an SI, RI, and feasibility study (FS). The overall site conclusion was that NFA was required for soil and that the constituents detected in groundwater are isolated detections not indicative of persistent groundwater contamination (Environmental Resources Management [ERM] 2001). The investigations did not include PFAS/PFOA analysis. During the September 2017 Installation site visit, the stakeholders agreed to include the Former IRP Site 7 (PRL 11) in this SI despite the site's location off Base. A brief site history is provided below.

2.3.1.1 PRL 11 – Former IRP Site 7 Burn Pit

The former burn pit area is southeast of Buildings 210 and 215 and is mostly outside of the Portland ANGB boundary. The majority of IRP Site 7 lies on Port of Portland property. The burn pit was used for fire training exercises between 1957 and 1978. Several thousand gallons of flammable liquids, including waste oil, jet propulsion fuel No. 4 (JP-4) jet fuel, and solvents, reportedly were burned each year in the pit (HMTC 1987). The former burn pit area has since been filled with gravel and compacted (ERM 2001).

2.3.2 Non-Fire Training Areas

2.3.2.1 PRL 1 – Building 170 – Base Supply

The Base Supply Building – Building 170 was built in 1990 and is located in the central portion of the Base. The building has stored AFFF for at least the last 10 years but likely has stored AFFF since its first use on the Base. According to Base supply personnel, no AFFF has been spilled in the building. At the time of the PA, 27, 55-gal drums of AFFF manufactured by 3M and National were stored at this location (BB&E 2016). The PA (BB&E 2016) recommended NFA, and this PRL will not be discussed further or evaluated in the SI WP.

2.3.2.2 PRL 2 – Building 180 – New Fire Department

The new Fire Department (FD) Building 180 was constructed in 2005. According to personnel that have worked at the Base FD since the late 1980s, the AFFF stored at this location is currently in Fire/Crash Response vehicles, including three crash trucks (two 25-gal trucks and one 250-gal truck), one fire engine (250 gal), and one foam trailer (2,000 gal). One former crash truck, awaiting disposal at the motor pool, contained 130 gal. FD personnel indicated that there were minor spills, which occurred during filling the vehicles over the years from onsite containers (now removed), and minor leaks from the equipment. Additionally, at least three occurrences of AFFF being discharged to the stormwater sewer system were documented in the Annual Storm Water Reports (BB&E 2016).

2.3.2.3 PRL 3 – Hangar 250

Hangar 250 was built in 1985. AFFF is stored in fire suppression equipment in the mechanical room of this hangar. According to the label, the tank has a design capacity of 200 gal but the net contents are 55 gal of AFFF. There have been minor leaks of AFFF in this room, with no reported inadvertent releases in the hangar. Currently, no AFFF is present in the hangar, although one empty 55-gal barrel is currently present. No records of spills are reported to have occurred at this location (BB&E 2016).

2.3.2.4 PRL 4 – Hangar 255

Hangar 255 was constructed in 1956. AFFF is stored in fire suppression equipment in the mechanical room of this hangar. The placard on the tank states that it contains 600 gal of AFFF manufactured in 1994. There have been minor leaks of AFFF in this room, with an inadvertent release in the main hangar (BB&E 2016).

On October 19, 2005, Environmental Management personnel noticed foam on the pavement near Hangar 255 and questioned the local office personnel. The investigation indicated that the AFFF system in the hangar had been tested earlier that day as part of an annual testing program and 0.5 gal of pure AFFF mixed with 49.5 gal of water that overflowed the system and was rinsed off the pavement into a storm drain located on the south side of Hangar 255. Environmental Management personnel reported the incident to the ODEQ and further AFFF testing that day was suspended. Environmental Management personnel inspected the stormwater ditches and stormwater detention ponds to look for evidence of foam. On October 20, 2005, the ditches and ponds were again inspected and no foam was evident. A sample was collected at Outfall 10 and analyzed for biochemical oxygen demand 5 (BOD5). The actual BOD5 result was greater than 300 mg/L, since the high oxygen concentrations saturated the test and could not yield a true value. On October 21, 2005, the stormwater ditch feeding the north pond showed evidence of foam. Six aerators in the north pond and eight aerators in the south pond kicked up small patches of persistent foam covering an estimated area of 16 sq ft. By the afternoon that day, the foam had dissipated. A sample was again collected and analyzed for BOD5, which yielded a concentration of 10 mg/L. The problem was discussed with Civil Engineering (CE) management personnel. CE personnel redesigned the plumbing configuration to prevent future annual AFFF testing at Hangar 255 from discharging to the storm sewer system (BB&E 2016).

2.3.2.5 PRL 5 – Building 290 – Old Fire Department and Swale

Building 290 was built in 1986 and housed the old FD from approximately 1986 to 2005. According to personnel that have worked in this building since the late 1980s, AFFF was historically stored at this location in Fire/Crash Response vehicles. FD personnel indicated that there were minor spills, which occurred during the filling of vehicles over the years from onsite containers (now removed), and minor leaks from the equipment. Additionally, personnel indicated at least one spill of AFFF of unknown quantity discharged to the drainage swale northwest of the building (BB&E 2016).

2.3.2.6 PRL 6 – Hangar 310

Hangar 310 was built in 1988. AFFF is stored in fire suppression equipment in the mechanical room of this building. There are three tanks in the room, very similar in size to the tanks in Hangar 375, although there were no volumes listed on the tanks. It is presumed that two of the tanks contain 800 gal and one contains 600 gal. The date of manufacture listed on the tanks is 1987. There have been minor leaks of AFFF in the room, with an inadvertent release in the main hangar. It is likely that most of the inadvertent release of AFFF was hosed off into the floor drain within the hangar, which is connected to the sanitary sewer system. Some of the AFFF would also likely have made its way onto the ramp to the north of Hangar 310, and then into the storm sewer system (BB&E 2016).

2.3.2.7 PRL 7 – Hangar 380

Hangar 380 was built in 1986. AFFF was stored in fire suppression equipment in the mechanical room of this building. There currently are no tanks in the room. It is reported that the tanks were removed in 2005. Personnel interviewed did not know of any discharges in the room or in the main hangar (BB&E 2016).

2.3.2.8 PRL 8 – Hangar 375

Hangar 375 was built in 1988. AFFF was stored in fire suppression equipment in the mechanical room of this building. There are three tanks in the room with no labels listing their volumes. It is presumed that two of the tanks contain 800 gal and one contains 600 gal. There have been minor leaks of AFFF in the room, with an inadvertent release in the main hangar. It is likely that most of the inadvertent release of AFFF was hosed off into the floor drain within the hangar, which is connected to the sanitary sewer system. Some of the AFFF would also likely have made its way onto the ramp to the north of Hangar 375, and then into the storm sewer system (BB&E 2016).

2.3.2.9 PRL 9 – Building 431 – POL Storage

Petroleum, oils, and lubricants (POL) are stored in Building 431, which was constructed in 1994. This building formerly contained the AFFF system tank that provided fire protection for the fuel tanks. No leaks or inadvertent discharges were reported and the system was removed in 2013 (BB&E 2016). During the September 2017 Installation site visit/kick-off meeting with Portland ANG and ODEQ, the stakeholders concluded that PRL 9 – Building 431 would not be carried over to the SI for further investigation. This conclusion is based on an inspection of AFFF storage/use at this location, an interview with an ANG employee during the SI, and supporting information presented in the PA.

2.3.2.10 PRL 10 – Ponds/Stormwater Retention Basins

There are two man-made, shallow ponds located in the west central portion of the Base that receive 95% of the Base's stormwater discharge. These ponds are fed by ditches that converge just north of the ponds where the stormwater is discharged into the ponds through a pipe. All of the previously aforementioned releases to the storm sewer system eventually made their way to these two ponds (BB&E 2016). The ponds are located near the western boundary of the Base, as shown in Figure 1-1.

THIS PAGE INTENTIONALLY LEFT BLANK.

3.0 ENVIRONMENTAL SETTING

3.1 CLIMATE

Portland ANGB is situated in a temperate climate region with mild winters and summers. The area is subject to low-volume, high-frequency rainfall events in the early spring and fall. The average temperature of Multnomah County, Oregon is 53.60°F, which is higher than most of Oregon and is about the same as the national average temperature of 54.45°F. Annual rainfall amounts in Multnomah County are 45.59 in. with 105.04 days of 0.1 in. of rain or more of precipitation. Average annual snowfall in the area is 2.80 in. Average wind speed for the area is 14.86 miles per hour and is usually out of the west and northwest (USA.com 2017).

3.2 TOPOGRAPHY

Portland ANGB is located on a levee-protected floodplain of the Columbia River. Portland ANGB and PDX are bordered by the Columbia River to the north and the Columbia Slough to the south. The local floodplain has little to no natural topography and gently slopes north toward the Columbia River. PDX and Portland ANGB average 30 ft above mean sea level (AMSL) (BEM Systems [BEM] and ARCADIS U.S. [Arcadis] 2013).

3.3 GEOLOGY

Multnomah County and Portland, Oregon are located on a topographic boundary known as the Columbia Plateau, a region marked by Eocene volcanic features and late Miocene fluvial deposits from the Cascade Mountain Range. Portland ANGB is situated on quaternary age terrace alluvium, composed of floodplain and terraced bedded sands, silts, and clays ranging in thickness from 100 to 200 ft. The terrace alluvium locally overlies the Troutdale Formation, which is approximately 800 to 900 ft thick, and while nearly horizontal has very gentle slopes to the west and southwest. The Troutdale Formation consists of well-sorted, coarse-grained sandstone and a conglomerate with well-rounded quartzite pebbles set in a very fine clay mineral matrix. The upper few feet of the formation are highly weathered and nearly indistinguishable from prolonged exposure. The Troutdale Formation strikes to the north and gently dips to the west and southwest at 2 degrees (U.S. Department of the Interior [DOI] 1963).

3.4 SOIL

Soils present at Portland ANGB have been classified during previous site investigations and are separated into two distinct categories. The primary soil underlying most of Portland ANGB is the Pilchuck Soil Complex. The Pilchuck Soil Complex is composed of 1 ft of silty topsoil underlain by 5 ft of well-sorted, highly permeable, dark brown sands. The other soil type found at Portland ANGB is the Sauvie-Rafton Complex, consisting of 75 to 90 in. of poorly drained soils that are silty loam to silty clay in texture. Sauvie-Rafton soils are a common component of floodplain structures along the Columbia River, much like the one Portland ANGB is situated on (ERM-West, Inc. [ERM] 2013).

3.5 SURFACE WATER HYDROLOGY

There are natural and significant surface water bodies and both navigable and non-navigable waterways at and adjacent to Portland ANGB. Surface water flow from the Portland ANGB and PDX eventually drains to the Columbia Slough. The Columbia Slough is directly south of Portland ANGB and is a complex of narrow and shallow channels extending approximately 18 miles within the southern floodplain of the Columbia River. The Columbia River is the major surface water feature located to the north of Portland

ANGB and PDX. The Columbia Slough receives water from springs to the northeast of PDX, local groundwater seepage from shallow saturated zones, as well as local surface water runoff from Portland ANGB.

Surface water flow at Portland ANGB is dictated by the Base's man-made surface drainage system. Stormwater is captured by drainage ditches throughout the property, which then directs the flow to two man-made stormwater Detention Ponds on the Portland ANGB. The drainage ditch footprint occupies approximately 1.8 acres and consists of two branches. The main branch is approximately 2,800 ft long, and the north branch extends approximately 1,700 ft. The two branches converge at the point of discharge to the detention ponds. The outfall from the upper detention pond can be closed allowing the pond to be used as a containment area. Stormwater is discharged from the upper pond to the lower pond, before it is conveyed to PDX's detention pond, and then to Columbia Slough (ERM 2013).

3.6 HYDROGEOLOGY

Significant hydrogeologic units are present in the vicinity of PDX. These units include, in descending order, the Overbank Deposits, the Columbia River Sand Aquifer (CRSA), the Troutdale Gravel Aquifer (TGA), Confining Unit 1, the Troutdale Sandstone Aquifer, Confining Unit 2, and the Sand and Gravel Aquifer. Several of the hydrogeologic units underlying PDX are part of a regional aquifer system that serves as the city of Portland's supplemental water supply. Shallow groundwater at the Base occurs within the shallow alluvial terrace deposits and has been encountered during various investigations at depths ranging from 2 to 10 ft below ground surface (BGS). The inferred groundwater flow direction in the Overbank Deposits is predominantly toward the west and northwest. This differs from the CRSA, where recorded water level measurements suggest that the groundwater flow direction fluctuates between northeast and south. Generally, the water table is lowest in the late summer and fall and highest in the winter and spring (BB&E 2016).

According to the 2006 environmental baseline survey, the shallowest water bearing zone is a discontinuous, unconfined to semi-confined water-bearing sand unit, the top of which ranges in depth from 5.5 to 9.0 ft BGS and ranges in thickness from 3 to 19 ft. The discontinuous lenses of the upper zone are in scattered locations throughout the northern, eastern, and southwestern portions of Portland ANGB (CH2M Hill 2006).

Groundwater flow direction varies between water-bearing units and tends to fluctuate seasonally and in response to changes in the Columbia River stage caused by releases from Bonneville Dam. In the shallow aquifer, groundwater dominantly flows toward the west and northwest, although the flow direction varies considerably locally. Water levels in the shallow zone are influenced by recharge/discharge through drainage ditches throughout the subject property and the Columbia Slough to the south, although the hydraulic connection between the slough and the shallow aquifer may be muted by low-permeability sediments in the bed of the slough (CH2M Hill 2006).

3.7 CRITICAL HABITATS AND ENDANGERED/THREATENED SPECIES

According to the U.S. Fish and Wildlife Service (USFWS), the following federally listed threatened, endangered, or proposed species are known to or are believed to occur in Multnomah County, Oregon (USFWS 2017a):

- Mammals:
  - Columbian white-tailed deer (*Odocoileus virginianus leucurus)* – Threatened.

- Snails:
  - Puget oregonian (*Cryptomastix devia*) – Threatened.

- Fish:
  - Bull trout *(Salvelinus confluentus*) – Threatened.

- Birds:
  - Northern spotted owl *(Strix occidentalis caurina)* – Threatened,
  - Yellow-billed cuckoo (*Coccyzus americanus*) – Threatened,
  - Marbled murrelet (*Brachyramphus marmoratus*) – Threatened, and
  - Streaked horned lark (*Eremophila alpestris strigata*) – Threatened.

- Plants:
  - Nelson's checker-mallow (*Sidalcea nelsoniana*) – Threatened,
  - Golden paintbrush (*Castilleja levisecta*) – Threatened, and
  - Kincaid's lupine (*Lupinus sulphureus ssp. kincaidii*) –Threatened.

The potential for these species to occur in Multnomah County does not mean they are present at Portland ANGB.

The USFWS National Wetlands Inventory indicates roughly 0.54 acres are designated as wetlands along the ditch lines within the Portland ANGB property (USFWS 2017b).

THIS PAGE INTENTIONALLY LEFT BLANK.

4.0 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

The following sections describe potential applicable or relevant and appropriate requirements (ARARs) for the PRLs discussed within this SI WP. During the investigation and subsequent cleanup process, remedial alternatives are evaluated for compliance with identified ARARs. No remedial action is planned at this time; however, this section has been included to identify and document appropriate chemical-specific screening criteria for the evaluation of data gathered during the SI field activities.

4.1 CHEMICAL-SPECIFIC REQUIREMENTS

Chemical-specific requirements include limitations set on the amount or concentration of a chemical that can be either present in or discharged to the environment under promulgated federal and/or state regulations. These limits are typically health- or risk-based requirements.

PFOS/PFOA are emerging contaminants that have not been historically analyzed during site characterization activities; for that reason, minimal sampling data exist for most sites. Currently, no legally enforceable federal standards exist for PFOS/PFOA in environmental media. However, as explained in Section 1.2, Leidos will use residential risk-based screening levels for soil and sediment determined using the EPA RSL calculator and the November 2017 RSL tables for PFOS, PFOA, and PFBS. The EPA 2016 drinking water lifetime HA levels for PFOS and PFOA (combined) and the PFBS residential risk-based screening level for tap water from the RSL tables will be used for groundwater and surface water.

4.2 ACTION-SPECIFIC REQUIREMENTS

Action-specific ARARs are activity- and technology-based requirements that are applicable or relevant and appropriate to one or more remedial alternatives (EPA 1998). Potential federal ARARs, particularly if remediation is warranted and conducted at one or more of the sites, may include the following:

- 10 United States Code (U.S.C.) Sections 2701 through 2708 and 2810, Defense Environmental Restoration Program;
- 29 Code of Federal Regulations (CFR) 1926, Safety and Health Regulations for Construction;
- 40 CFR 260 through 279, Hazardous Waste Management and Resource Conservation and Recovery Act;
- 40 CFR 300 through 312, the National Oil and Hazardous Substances Pollution Contingency Plan and CERCLA; and
- 49 CFR 171 through 173 and 177, U.S. Department of Transportation Hazardous Materials Regulations.

4.3 LOCATION-SPECIFIC REQUIREMENTS

The impact of a contaminated site on human health and the environment is often determined by its location (EPA 1998). Compliance with location-specific regulatory requirements prevents damage to unique or sensitive areas, such as floodplains, historic places, wetlands, and fragile ecosystems, and can limit remedial activities that are potentially harmful because of where they take place. Federal actions that

involve potential impacts to, or take place within, sensitive areas should avoid long- and short-term adverse effects associated with occupancy and modification of the area. The Endangered Species Act is a potential ARAR that needs to be considered.

The Endangered Species Act (16 U.S.C. 1531 et seq., and 50 CFR 402) necessitates action be taken to protect any species listed as threatened and endangered, as well as their habitat. No threatened or critical habitat species are anticipated to be affected by the sampling activities associated with this investigation. No unique or sensitive areas will be impacted by the proposed field activities.

5.0 PERMITS AND PRE-FIELD ACTIVITIES

A Base dig permit will be required prior to intrusive field activities. No other permits are required for the SI field activities. However, several requirements must be met prior to field activities.

5.1 FIELD SCHEDULE COORDINATION

Leidos will confirm the fieldwork schedule with the Base Environmental Manager (EM) at least 2 weeks in advance of mobilization. Work will be conducted Monday through Friday between 0600 and 1800 unless arranged otherwise in advance.

5.2 BASE ACCESS

Leidos will coordinate with the Base EM to obtain Base access for all field personnel, including subcontractors. In addition, Leidos will coordinate with the current leaseholders/owners for access to Hangar 375 (PRL 8) and Former IRP Site 7 (PRL 11) for all field personnel, including subcontractors. All required security paperwork will be submitted at least 2 weeks prior to scheduled field activities. Upon arrival, the Leidos Field Manager (FM) will meet with the Base EM and outline planned activities. This will provide the Base EM an opportunity to relay any changes in site conditions or real-time information relevant to the specific sampling event. The FM will alert the Base EM that field activities are complete prior to demobilization.

5.3 PHOTOGRAPHY

Photography of SI field activities is permitted, with the exception of photographs showing aircraft. Leidos will notify the Base EM in advance and complete the paperwork needed to obtain approval for taking photographs during the SI field activities.

5.4 UTILITY CLEARANCE

A dig permit from Portland ANGB is required. Before starting field activities, Leidos will coordinate with Base personnel and Oregon Utility Notification Center (OUNC) (http://callbeforeyoudig.org/oregon/). OUNC will coordinate with local utility providers to identify and mark the locations of underground utilities and meet the Base requirements for an approved dig permit. ANG will mark private utilities.

The utility surveys are necessary to optimize the proposed technical approach and reduce the potential for utility damage. Prior to any drilling activities, Leidos will review Base utility maps with Base personnel, and select sample locations. Prior to drilling, a site walk and inspection of proposed locations will be conducted to ensure location access and safety. Based on the findings during the utility mark out and the site walk, proposed borings may be adjusted accordingly. Any location within 25 ft of a known hazardous utility (i.e., gas or electric) will be cleared via soft-dig methods (hand auger or vacuum excavation) to a depth of 5 ft BGS. For all other utilities marked by OUNC or ANGB personnel, sample locations will be cleared via hand auger or soft-dig methods following the state's protocol (generally soft-dig clearing within 2.5 to 5 ft of a utility). Every attempt will be made to relocate sample locations so they are more than the minimum distance from known utilities.

THIS PAGE INTENTIONALLY LEFT BLANK.

6.0 INVESTIGATION APPROACH AND PROCEDURES

6.1 WORK PLAN OBJECTIVES

This WP has been prepared to outline the sampling rationale for the SI phase and establish the methods and procedures that will be used during field activities to ensure that DQOs are satisfied.

6.2 GENERAL APPROACH (STRATEGY AND RATIONALE)

SI field activities will include the following:

- Surface and subsurface soil sampling;
- Confirmation of local groundwater flow direction at the Installation using historical data and/or temporary piezometers;
- Groundwater sampling from newly installed monitoring wells located downgradient from the PRL;
- Groundwater sampling from newly installed monitoring wells at the Installation boundary;
- Sediment and surface water sampling; and
- Global Positioning System (GPS) survey of soil borings, sediment, and surface water locations (newly installed wells require a professional licensed surveyor to survey the horizontal location and elevation).

6.2.1 Potential Media of Concern

Potential media of concern at Portland ANGB include soil, groundwater, sediment, and surface water. Depth to shallow groundwater is anticipated to range from approximately 2 to 10 ft BGS across the Installation (BB&E 2016). Soil sampling will be limited to the unsaturated zone.

6.2.2 Potential Sources of Contamination (Conceptual Site Model)

When AFFF is released to the environment, PFOS/PFOA can migrate into soil and groundwater. Once in the environment, the compounds are persistent and may migrate through erosion, surface water, groundwater, and/or biologic uptake. The amount of PFOS/PFOA that enters the environment depends on the type and amount of AFFF used, where and when it was used, the type of soil, and other factors. If private or public wells are located nearby, they could potentially be affected by PFOS/PFOA. Similarly, surface water features may be impacted and may convey PFOS/PFOA to downgradient receptors. Groundwater at the Base is not currently used as a source for drinking water; however, the Portland well field is located 0.75 miles southeast of Portland ANGB and provides the city of Portland's supplemental drinking water supply. Migration of groundwater to these wells or downgradient water wells may create a potential pathway for future receptors of drinking water. In addition, due to the shallow groundwater table, groundwater is considered a potential pathway for migration of PFOS/PFOA to surface water.

Potential environmental releases of AFFF at ANG Installations include, but are not limited to, the following locations and activities:

- FTAs;
- Fire stations;

- Fire truck equipment testing and maintenance areas;
- Aircraft for fuel emergency response activities;
- Testing or emergency activation of AFFF fire suppression systems (FSSs) in hangars and buildings;
- FSS releases in U.S. Air Force hangars and buildings due to malfunctions;
- Other spills and releases; and
- Stormwater and/or surface water via drainage canals, outfalls, wastewater treatment plants, or AFFF ponds.

6.2.3 Water Levels

The general flow direction for shallow groundwater at Portland ANGB is assumed to flow west-northwest (BB&E 2016). Since there are no existing wells, six temporary piezometers will be installed during the SI to confirm local groundwater flow direction. The temporary piezometers will be installed at selected soil boring and/or permanent monitoring well locations proposed for the SI. The temporary piezometers will be abandoned following water level measurements. The permanent monitoring wells will be placed immediately downgradient from the PRLs based on the temporary piezometer water levels and historical water level data. The water levels will be collected from the piezometers and monitoring wells during a single mobilization.

6.2.4 Environmental Sampling

Twenty-one soil borings will be advanced to assess the PRLs. Soil borings will be advanced up to 15 ft or refusal (whichever is encountered first), with two samples collected per boring: one at 0 to 2 ft BGS and one from the interval immediately above the water table. At PRL 10, soil samples will be collected from immediately above and below the liner within the ditch.

No existing monitoring wells are available for the SI at Portland ANGB. Eight newly installed permanent monitoring wells will be installed downgradient from the PRLs and/or at the Base boundary. In addition to soil and groundwater samples, a minimum of one sediment and one surface water sample also will be collected from the swale associated with Building 290 (PRL 5), the catch basin at Hangar 380 (PRL 7), and the ponds/stormwater retention basins (PRL 10). The sediment samples collected from PRLs 5 and 10 will be collected as composite sediment samples. The depth and volume of water and resulting accessibility of sediment at PRL 10 will be taken into account to ensure the safety of the field staff conducting the sampling.

A standardized numbering system will be used to identify all samples collected during the SI activities. The numbering system provides a tracking procedure to ensure accurate data retrieval of all collected samples. A listing of the sample identifiers will be maintained by the Leidos Data Manager. Sample identifiers for samples collected at Portland ANGB will follow the format outlined below:

- Soil samples: Primary sample identifiers will consist of the site identifier (POR), a two-digit number representing the nearest PRL potentially impacting the boring location (e.g., 01 = PRL 1), an alpha-numeric boring location identifier (SB1, SB2), and a two-digit alpha-numeric character representing the first or second sample collected (surface soil 0 to 2 ft BGS is 01; interval immediately above the water table is 02):
    - POR01-SB1-01 represents the surface soil sample collected at PRL 01, boring SB-1.

- POR01-SB1-02 represents the subsurface soil sample collected immediately above the water table at boring SB-1.

- New monitoring wells: Primary sample identifiers will consist of 'MW' plus the site identifier (MW-POR); a two-digit number representing the nearest PRL to the boring location (e.g., 06 = PRL 06), followed by a two-digit number (01 for the first well associated with a specific PRL, 02 for the second well associated with that PRL, etc.); and a two-digit number (e.g., 01 is the first sample collected):

  - MW-POR06-01-01 represents the SI groundwater sample from the well installed nearest to PRL 06.

- Sediment samples: Primary sample identifiers will consist of the site identifier (POR), a two-digit number representing the PRL associated with the sediment location (e.g., 07 = PRL 07), the alpha-numeric designation 'SD1' to indicate the sediment sample from the first sediment location associated with PRL 07, and a two-digit number (e.g., 01 is the first sample collected):

  - POR07-SD1-01 represents the SI sediment sample collected at PRL 07.

- Surface water samples: Primary sample identifiers will consist of the site identifier (POR), a two-digit number representing the PRL associated with the surface water location (e.g., 07 = PRL 07), the alpha-numeric designation 'SW1' to indicate the surface water sample collected from the first surface water location associated with PRL 07, and a two-digit number (e.g., 01 is the first surface water sample collected):

  - POR07-SW1-01 represents the SI surface water sample collected at PRL 07.

The overall sampling approach with descriptions and supporting rationale for each PRL is provided in Table 6-1. An overview of PRL locations is shown in Figure 1-1. Detailed maps of proposed sample locations are shown in Figures 6-1 and 6-2.

6.2.5 Quality Control Samples

Field duplicate samples, field blanks, reagent blanks, and equipment rinsate blanks will be submitted to the analytical laboratory to provide a means to assess the quality of the data resulting from the field sampling program. Field blank samples from all water sources, including on-Base potable water, used during SI field activities will be collected concurrently with the SI environmental samples and will be analyzed to check for procedural contamination and ambient conditions at the site that may have caused sample contamination. Reagent blanks will be collected to determine if method analytes or other interferences are introduced throughout the entire shipment, sampling, and analytical process. Duplicate samples will be submitted to provide a QA check on analytical procedures and results. The required QC samples and associated frequencies for this project are listed in Table 6-2. Table 6-3 provides details on the requirements for containers, preservation, and sample hold times. UFP-QAPP Worksheet #20 (Appendix A) provides more information on QC samples, and UFP-QAPP Worksheet #28 (Appendix A) provides more information on analytical laboratory QC samples, including matrix spike (MS) and matrix spike duplicate (MSD) samples.

Table 6-1. Proposed Sample Locations and Analyses for Portland ANGB

PRL Number	Medium	Location Identifier	Sample Identifier[a]	Lithologic Log	Analysis[b]	Notes
2: New Fire Department – Building 180	Soil	POR02-SB1	POR02-SB1-01	Yes	PFOS/PFOA	The southern sample is within the building where evidence of dripping from an AFFF line was noted during the site walk and is associated with the center bay within the building.
			POR02-SB1-02			
		POR02-SB2	POR02-SB2-01			Soil sample from immediately north of the building where three instances of AFFF were discharged to the stormwater drain and catch basin located north of the building.
			POR02-SB2-02			
	GW	MW-POR02-01	MW-POR02-01-01	Yes	PFOS/PFOA	New well based on stakeholder interest in the center bay of the building.
3: Hangar 250	Soil	POR03-SB1	POR03-SB1-01	Yes	PFOS/PFOA	Soil sample from grassy areas immediately northwest of the hangar bay and northwestern corner of the building. Groundwater will be evaluated using MW-POR04-01 based on collocation of PRLs 3 and 4.
			POR03-SB1-02			
		POR03-SB2	POR03-SB2-01			
			POR03-SB2-02			
4: Hangar 255	Soil	POR04-SB1	POR04-SB1-01	Yes	PFOS/PFOA	Soil samples immediately north and west of the hangar.
			POR04-SB1-02			
		POR04-SB2	POR04-SB2-01			
			POR04-SB2-02			
		POR04-SB3	POR04-SB3-01			Soil samples adjacent to the OWS immediately southwest of the hangar.
			POR04-SB3-02			
	GW	MW-POR04-01	MW-POR04-01-01	Yes	PFOS/PFOA	New well downgradient from PRLs 03 and 04 based on assumed groundwater flow direction.
5: Old Fire Department and Swale – Building 290	Soil	POR05-SB1	POR05-SB1-01	Yes	PFOS/PFOA	Soil sample immediately north and west-northwest of the old FD.
			POR05-SB1-02			
		POR05-SB2	POR05-SB2-01			
			POR05-SB2-02			
		POR05-SB3	POR05-SB3-01	Yes	PFOS/PFOA	Samples from the swale northwest of the building based on known release of AFFF. The sediment sample will be collected as a composite sample from the swale. The new well location is downgradient from PRL based on assumed groundwater flow direction.
			POR05-SB3-02			
	GW	MW-POR05-01	MW-POR05-01-01	Yes	PFOS/PFOA	
	Sediment	POR05-SD1	POR05-SD1-01	NA	PFOS/PFOA	
	Surface Water	POR05-SW1	POR05-SW1-01	NA	PFOS/PFOA

			POR08-SB2-02			
	GW	MW-POR08-01	MW-POR08-01-01	Yes	PFOS/PFOA	New well in the grassy area downgradient from the PRL based on assumed groundwater flow direction.
10: Ponds/Storm Water Retention Basins	Soil	POR10-SB1	POR10-SB1-01	Yes	PFOS/PFOA	Stormwater ditch leading to retention ponds. There is a liner in the ditch from previous environmental work. Soil borings will be placed adjacent to the ditch to prevent damage to the liner. Based on stakeholder discussion, samples should be collected from above and below the liner.
			POR10-SB1-02			
		POR10-SB2	POR10-SB2-01	Yes	PFOS/PFOA	
			POR10-SB2-02			
	GW	MW-POR10-01	MW-POR10-01-01	Yes	PFOS/PFOA	New well in the grassy area along western Base boundary.
	Sediment	POR10-SD1	POR10-SD1-01	NA	PFOS/PFOA	Samples collected from northern pond adjacent to the outfall from the storm ditch. Assuming safe accessibility, sediment samples will be collected as composite samples within the ponds.
	Surface Water	POR10-SW1	POR10-SW1-01	NA	PFOS/PFOA	
	Sediment	POR10-SD2	POR10-SD2-01	NA	PFOS/PFOA	Samples collected from southern pond.
		POR10-SD3	POR10-SD3-01	NA	PFOS/PFOA	
	Surface Water	POR10-SW2	POR10-SW2-01	NA	PFOS/PFOA	
		POR10-SW3	POR10-SW3-01	NA	PFOS/PFOA	

Table 6-1. Proposed Sample Locations and Analyses for Portland ANGB (continued)

PRL Number	Medium	Location Identifier	Sample Identifier[a]	Lithologic Log	Analysis[b]	Notes
11: Former Site 7 Burn Pit	Soil	POR11-SB1	POR11-SB1-01	Yes	PFOS/PFOA	Samples will be collected from within the former burn pit as well as along the northern and western boundaries of the burn pit.
			POR11-SB1-02			
		POR11-SB2	POR11-SB2-01			
			POR11-SB2-02			
		POR11-SB3	POR11-SB3-01			
			POR11-SB3-02			
	GW	MW-POR11-01	MW-POR11-01-01	Yes	PFOS/PFOA	New well at the center of the former burn pit area. Will be collocated with POR11-SB1.

[a] Two samples will be collected per boring—one from 0 to 2 ft BGS, and the second from the interval immediately above the water table. Actual depth of the subsurface sample will be the 2-ft interval above groundwater table. At PRL 10, soil samples will be collected from immediately above and below the liner within the ditch.
[b] PFOS/PFOA is used generically in this Site Inspection Work Plan to include the following six 2012 third Unregulated Contaminant Monitoring Rule emerging contaminants: PFOS, PFOA, PFBS, perfluorononanoic acid, perfluoroheptanoic acid, and perfluorohexanesulfonate. All samples will be analyzed for PFOS/PFOA using U.S. Environmental Protection Agency, Method 537, revision 1.1.
Note: Groundwater sampling also will include monitoring of field parameters: water level, pH, temperature, conductivity, oxidation-reduction potential, dissolved oxygen, and turbidity.
AFFF = Aqueous film-forming foam.
ANGB = Air National Guard Base.
BGS = Below ground surface.
FD = Fire department.
GW = Groundwater.
MW = Monitoring well.
NA = Not applicable.
OWS = Oil/water separator.
PFBS = Perfluorobutane sulfonate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
PRL = Potential release location.
SB = Soil boring.
SD = Sediment.
SI = Site Inspection.
SW = Surface water.

Table 6-2. Quality Control Samples[a]

Matrix/Analytes	Number of Primary Samples	Number of Field Duplicates	Number of Field Blanks[b]	Number of Reagent Blanks	Number of Equipment Rinsate Blanks	Number of MS/ MSD	Total Number of Samples
Groundwater (PFOS/PFOA)	8	1	1/1	1	1	1/1	15
Soil (PFOS/PFOA)	42	4	0	0	4	2/2	54
Surface Water (PFOS/PFOA)	5	0	0	0	1	0	6
Sediment (PFOS/PFOA)	5	0	0	0	1	0	6

[a] Quality control sample counts are based upon the maximum potential number of primary samples and will be adjusted based upon final sample counts.
[b] One field blank will be collected from each distinct water source. This includes potable water, deionized water, etc.
MS = Matrix spike.
MSD = Matrix spike duplicate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.

Table 6-3. Laboratory Method, Container Requirements, Preservation, and Sample Hold Times

Analyte[a]	Matrix	Method	Container(s) (number, size, and type per sample)	Preservation	Sample Holding Time
PFOS/PFOA	Water	EPA Method 537, revision 1.1	250-mL polypropylene with polypropylene cap	Cool to 4°C ±2°; Trizma preservative for aqueous samples with residual chlorine	14 days to extraction 28 days to analysis
	Solids	EPA Method 537 modified, revision 1.1	250-mL polypropylene with polypropylene cap	Cool to 4°C ±2°	28 days to extraction 28 days to analysis

[a] PFOS/PFOA is used generically in this Site Inspection Work Plan to include the following six 2012 third Unregulated Contaminant Monitoring Rule emerging contaminants: PFOS, PFOA, PFBS, perfluorononanoic acid, perfluoroheptanoic acid, and perfluorohexanesulfonate. All samples will be analyzed for PFOS/PFOA using EPA Method 537, revision 1.1.
Trizma preservative will only be used for the potable water sample.
EPA = U.S. Environmental Protection Agency.
PFBS = Perfluorobutane sulfonate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.

Field duplicates for all media will be assigned sample identifiers identical to the primary sample with the letter 'D' at the end of the sample identifier.

Field blanks will be collected for each distinct water source (e.g., potable water, deionized [DI] water) used during the SI field activities and will be assigned sample identifiers beginning with the letters 'FB' followed by two digits sequentially assigned (i.e., the first field blank collected on the project will be given the sample identifier 'FB-01'; the second, 'FB-02'; etc.). The chain-of-custody (CoC) and field logbook will clearly identify the source of the water sampled (e.g., potable water source or DI water).

One reagent blank will be collected and analyzed for each project. At the laboratory, the reagent blank sample will be filled with reagent water and preservatives, sealed, and shipped to the sampling site along with an empty sample bottle (no preservatives). At the sampling site, the field technician must open the shipped field reagent blank and pour the preserved reagent water into the empty shipped sample bottle, seal it, and label this bottle as the field reagent blank. The bottle labeled field reagent blank will be shipped back to the laboratory along with the primary and QC samples.

Equipment rinsate blanks will be assigned sample identifiers beginning with the letters 'ER' followed by two digits sequentially assigned (i.e., the first equipment rinsate blank collected on the project will be given the sample identifier 'ER-01'; the second, 'ER-02'; etc.). The field logbook will clearly identify the sample(s) collected with the reusable equipment immediately prior and/or immediately following collection of the equipment rinsate sample, and the CoC will clearly identify the medium with which the equipment rinsate is associated (e.g., 'groundwater rinsate' when the equipment rinsate was collected from groundwater sampling equipment, or 'soil rinsate' when the equipment rinsate was collected from direct-push technology [DPT] soil sampling equipment, etc.).

Additional volumes sent for MS/MSD analyses will be submitted under the same sample identifier as the primary sample with a notation on the CoC that additional volumes were submitted for MS and MSD analyses.

6.2.6 Analytical Suite

All environmental samples will be analyzed by EPA Method 537 revision 1.1, in accordance with the 2012 Air Force Interim Guidance (USAF 2012) and the *U.S. Department of Defense Quality Systems Manual for Environmental Laboratories*, Version 5.1 (DoD 2017) for the six chemicals identified in UCMR3, specifically:

- PFOS,
- PFOA,
- PFNA,
- PFHxS,
- PFHpA, and
- PFBS.

Further analytical details are provided in the UFP-QAPP (Appendix A).

6.2.7 Health and Safety

Due to the possible presence of volatile organic compounds (VOCs) (primarily benzene, toluene, ethylbenzene, xylenes, and total petroleum hydrocarbons) in soil and groundwater at Portland ANGB, a photoionization detector (PID) will be used to monitor for VOCs in the breathing zone during soil boring and well installation activities. The intended use of the data is to identify the presence or absence of

contaminants in the breathing zone during site activities. All PID readings will be recorded in a bound field logbook.

PIDs will be verified daily according to the manufacturer's instructions. PIDs will be calibrated daily with a gas of known concentration. All daily calibration information will be recorded in the Measure and Test Equipment logbook. PID action levels for drilling and groundwater sampling activities are provided in the SSHP (Appendix B).

THIS PAGE INTENTIONALLY LEFT BLANK.

7.0 FIELD TECHNICAL PROCEDURES

Leidos has developed Standard Operating Procedures (SOPs) for fieldwork that will be used during the project. The applicable field technical procedures, listed on Worksheet #21 of the UFP-QAPP (Appendix A), are accessible by Leidos employees on the Leidos internal QA website and will be maintained onsite by the Leidos FM, along with a copy of this WP. Manufacturers' operating and calibration procedures for monitoring and measuring instruments also will be available onsite for use by the field team.

7.1 SAMPLE COLLECTION

Because PFOS/PFOA are found in numerous everyday items, the following special precautions will be taken during all PFOS/PFOA sampling activities:

- No use of Teflon®-containing materials (i.e., Teflon® tubing, bailers, tape, or plumbing paste);
- No Tyvek® clothing, and clothes treated with stain- or rain-resistant coatings will be avoided or required to have gone through several washings;
- No waterproof field notebooks;
- No Post-It® Notes handled during preparations for sampling or brought onsite;
- No fast food wrappers, disposable cups, or microwave popcorn brought onsite during sampling;
- Hands washed after handing above-mentioned items and prior to any sampling activities;
- No chemical (blue) ice packs allowed; and
- Nitrile gloves will be worn during all sample collection activities.

Additional field sampling protocols to avoid cross-contamination during sampling for PFOS/PFOA are included as Enclosure 3 of the Department of Navy's December 2015 *Memorandum – Testing for Perfluorochemicals (PFCs) in Drinking Water* (Navy 2015). A copy of this sampling protocol will be included in Appendix C of this SI WP.

7.1.1 Underground Utilities Location

All sampling locations within 25 ft of a known hazardous utility (e.g., gas or electric) will be cleared for utilities via hand auger or soft-dig techniques. If asphalt or concrete is present in those sample locations, a coring drill or road saw will be utilized to cut the surface cap to allow utility clearance to proceed. Hand auger or soft-dig techniques will be used to clear the proposed borehole location to a diameter at least 4 in. greater than the outside diameter of the bit used to drill the monitoring well to a depth of 5 ft. Soil cuttings from the hand auger or soft-dig techniques will be screened by the onsite geologist. Surface soil grab samples will be collected using the hand auger from the 0- to 2-ft BGS soil interval and remaining soil and all cuttings will be contained, and a cone or temporary cap will be placed over the borehole until the drill rig can be mobilized.

7.1.2 Soil Sampling by Hand Auger and/or Direct-Push Technology

Sample locations have been biased toward known or likely discharge or spill locations. Additional sample locations include grassy areas around doorways, just off the edge of garage entrances, along taxiways, near AFFF hydrants, near degraded macadam in front of service building and hangars, and along interior floor drains where seams or breaks are found.

Leidos will collect two soil samples per boring for PFOS/PFOA analyses. Borings will be advanced using a combination of hand auger and track-mounted direct-push drilling system. Hand auger samples will be collected from the top 2 ft BGS within grassy or uncovered areas. Direct-push borings will continue to refusal, or a maximum of 15 ft BGS. Where a sample location is determined to be valuable under flooring, near cracks, or in drains near AFFF storage, use, or release areas, Leidos will first core through the floor at an appropriate diameter and then advance a hand auger and/or DPT coring system.

All soil sampling activities will be overseen by a Leidos scientist or engineer experienced with drilling and sampling. Each soil core will be logged for lithology in accordance with the ANG Investigation Guidance (ANG 2009) and Leidos SOPs. During the advancement of the soil borings, continuous soil samples will be collected, screened with a PID, and visually examined for evidence of potentially contaminated areas or zones. Two samples will be collected from each boring—one from 0 to 2 ft BGS, and one from the interval immediately above the water table. At PRL 10, soil samples will be collected from immediately above and below the liner within the ditch. If refusal is encountered prior to the water table, a soil sample will be collected immediately above refusal. All soil boring locations will be mapped with a handheld digital GPS device with sub-meter accuracy prior to demobilization.

At the completion of sampling, each borehole will be abandoned with bentonite to seal off the potential contaminant migration pathway to groundwater. The ground surface will be restored to surrounding conditions.

7.1.3 Groundwater Sampling Methods

A PID will be used to monitor the well casing headspace during groundwater sampling activities. Any sample with a high PID reading will be noted on the CoC form. This information may be important to the laboratory because high VOC concentrations will interfere with the PFOS/PFOA analysis and may require a higher dilution factor. Providing this information to the laboratory ahead of time will enable them to run the sample at multiple dilutions within the holding time. Otherwise, the laboratory may not be able to re-analyze within the holding time.

7.1.3.1 Water level measurements

Prior to sampling any permanent groundwater monitoring well, the depth to water (from top of casing) will be measured and recorded. Following completion of sampling, the total depth (from top of casing) will be measured and recorded.

All depth measurements will be recorded in the field logbook to the nearest 0.01 ft.

7.1.3.2 Monitoring well purging and sampling

Groundwater sampling will be conducted using low-flow techniques in accordance with the ANG Investigation Guidance (ANG 2009). Required sampling equipment includes a peristaltic or submersible pump, polypropylene tubing, a flow-through cell, and a water quality meter capable of monitoring pH, temperature, specific conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP), and

turbidity. To avoid the potential for cross-contamination, all pumps and other required equipment will be free of PFOS/PFOA-containing components.

Wells are generally sampled from "clean to dirty" in order of increasing contaminant levels. However, PFOS/PFOA sampling data are not available for proposed monitoring wells. Therefore, until additional sampling data are available, wells will be sampled based on their location in an order that is most efficient for field personnel.

Following water level measurements, the sampling pump will be placed within the well at the estimated midpoint of the screened interval. Purging will be conducted at a low-flow rate to remove stagnant water within the well and ensure that the groundwater sample collected is representative of the surrounding aquifer. One of the goals of low-flow sampling is to minimize the drawdown in the water column within the well during pumping. If the water level is observed to be falling, the pumping rate will be decreased to the extent possible. If the well exhibits slow recharge and cannot sustain even low-flow pumping, the well will be purged until dry, allowed to recharge, and then sampled.

During purging, water quality measurements will be recorded in the field logbook at intervals of 3 to 5 min until specific parameters have stabilized for three consecutive readings as follows:

- pH ± 0.1 standard unit.
- Temperature ± 1°C.
- Conductivity (ms/cm) ± 10%.
- ORP ± 10 mV.
- DO (mg/L) ± 10%.
- Turbidity ± 10% and <50 nephelometric turbidity units (NTUs). Where the turbidity reading is greater than 50 NTUs, if the turbidity measurement has not varied more than 10% over three consecutive readings, the turbidity parameter will be considered stabilized.

Groundwater samples will be collected for analysis of PFOS/PFOAs (i.e., six UCMR3 chemicals).

7.1.4 Sediment and Surface Water Sampling Methods

Sediment and surface water samples will be collected from PRLs where sediment and surface water media are present (e.g., stormwater outfalls, stormwater detention ponds).

7.1.4.1 Sediment samples

Sediment samples will be collected directly from the selected location at 0.5 to 1 ft BGS using decontaminated stainless steel sampling trowels, a hand auger, or a dredge. All sediment sample locations will be mapped with a handheld digital GPS device with sub-meter accuracy prior to demobilization.

7.1.4.2 Surface water samples

Surface water samples will be collected from ambient flow prior to sediment sample collection to avoid sediment sampling-induced turbidity. Surface water samples will be collected from the upper portion of the water column directly from the selected location by one of the following methods:

- Peristaltic pump with dedicated tubing.

- High-density polyethylene/low-density polyethylene (HDPE/LDPE) dedicated/disposable bailer with HDPE/LDPE check ball (no Teflon®).

- Stainless steel reusable cup/scoop/dipper decontaminated after each use.

- Dedicated HDPE/LDPE container, such as a laboratory bottle without preservative. Submerge the container just below the water surface to fill, and then transfer the collected water to the laboratory bottle with preservative.

All surface water sample locations will be mapped with a handheld digital GPS device with sub-meter accuracy prior to demobilization.

7.2 WELL CONSTRUCTION METHODS

7.2.1 Temporary Piezometers

Temporary piezometers will be installed for the purpose of determining local groundwater flow only. No samples will be collected from the temporary piezometers in accordance with the Statement of Objectives (NGB 2017). Temporary piezometer borings will be advanced using DPT to approximately 7 ft below the first water-bearing zone. The diameter of the boring will be such to allow for a 1-in.-diameter screen and casing to be installed. The well casing and screen materials used for construction of the temporary piezometers will be composed of new, pre-cleaned, nominal 1-in.-diameter, Schedule 40 polyvinyl chloride (PVC). The slot openings for the screen will equal 0.010 in. The well screen for the piezometers is anticipated to be 10 ft in length. The screen used for the piezometer will be installed such that the top of the screen is at or below the water table and the bottom of the screen cap is placed no more than 1 ft above the bottom of the drilled borehole. The temporary piezometers will not be grouted to the surface because the piezometers will be abandoned after water level measurements are taken. Purging will not be required.

7.2.2 Groundwater Well Construction

Boreholes will be advanced with a DPT, hollow-stem auger drilling rig, or air-rotary percussion drilling rig, as required, to approximately 7 ft below the first water-bearing zone or to a depth not to exceed 20 ft BGS. The diameter of the boring will be such to allow for a 2-in.-diameter well to be installed and still allow sufficient annular space to add the filter pack, bentonite seal, and annular grout.

Wells will be installed with flush-mount completions. Surface completions will meet Base requirements. The borehole will be drilled to a depth such that the screen intercepts the water table at the site. The well casing will extend to a height of approximately 0.25 ft below the adjacent ground surface. The top of the well casing will be level so that the difference in elevation between the highest and lowest points on the top of the casing is less than or equal to 0.2 in. The wells will be composed of new, pre-cleaned 2-in.-diameter, schedule 40 PVC with 10-ft screened sections and a slot size of 0.010 in. The well screen will be placed such that approximately 7 ft is below the water table and 3 ft is above.

Six in. of sand will be placed under the bottom of the well screen to provide a firm footing. The screen used for the monitoring well will be installed such that the bottom of the screen cap is placed no more than 1 ft above the bottom of the drilled borehole. Granular filter pack material used for the monitoring well will be placed around the well screen by pouring the sand in the annulus between the screen and the borehole. The granular filter pack material (#5 or #7 sand) will extend from the bottom of the borehole to approximately 2 ft above the top of the well screen depending on final well construction depth. Sand placement will be

continuously measured using a weighted tape. In the event that the filter sand begins bridging in the annular space, the filter pack will be emplaced using a tremie pipe. The filter pack will extend from the bottom of the borehole to a minimum of 2 ft above the top of the well screen (if possible based on total depth of the well). The final depth to the top of the filter pack will be measured directly with a weighted tape and recorded on the associated well construction diagram.

Compressed, non-coated bentonite pellets will be poured into the annular space above the sand pack to form a seal. Pellets will be emplaced to a thickness of at least 2 ft without allowance for swelling during hydration (if possible based on the total depth of the well). If necessary, the bentonite pellets will be hydrated with 5 to 10 gal of approved potable and PFOS/PFOA-free water. The remainder of the borehole annulus will be sealed with a bentonite grout mixture (approximately 2%) emplaced via tremie pipe or direct installment. All materials used to construct the monitoring wells will be documented by the field geologist.

After the grout has been allowed to cure for a minimum of 24 hr, the wells will then be fitted with flush-mounted manhole covers set in concrete. The top of the wells will be sealed with a locking plug. The concrete surrounding the manhole cover will be completed with a slight slope to prevent pooled water and to also minimize potential damage from snow-plowing and related site activities. Manhole covers will be at least 8 in. in diameter and will include bolts and gaskets to secure the lid and prevent surface water from entering the well vault. All wells will be labeled with a paint pen.

For wells installed in locations prone to ponded water and/or flooding, wells will be finished with either a standard 3-ft protective steel casing or a stainless-steel roadbox.

7.2.3 Monitoring Well Development

Well development will be conducted in accordance with the ANG Investigation Guidance (ANG 2009). The development of monitoring wells installed during the project will be initiated no sooner than 24 hr after placement of annular grout to the ground surface. The monitoring wells installed during this project will be developed using the pump-and-surge method with a submersible pump and tubing. Well identification numbers will be applied to each well lid using a paint pen or marker. Wells with sufficient flow will be developed until water quality parameters (i.e., pH, temperature, conductivity, DO, ORP, and turbidity) are stable, as defined below. Wells without sufficient flow will be developed by alternative methods, such as with a surge block, or purged dry and allowed to recover. Water quality parameter stabilization is defined as three consecutive readings within the following ranges:

- pH ± 0.1 standard units.
- Temperature ± 1°C.
- Conductivity (ms/cm) ± 10%.
- DO (mg/L) ± 10%.
- ORP ± 10 mV.
- Turbidity ± 10% or <50 NTUs. Where the turbidity reading is greater than 50 NTUs, if the turbidity measurement has not varied over three consecutive readings and all other parameters have stabilized, the turbidity parameter will be considered satisfied.

Newly installed monitoring wells will be allowed to equilibrate following development. Water level measurements will be taken prior to purging, and the wells sampled as described in Sections 7.1.3.1 and 7.1.3.2.

7.3 BOREHOLE ABANDONMENT

Soil borings and temporary piezometers will be abandoned in accordance with state regulations and ANG guidance. Boreholes will be abandoned immediately following the completion of sampling, water level measurements, and surveying to remove the potential contaminant migration pathway to groundwater.

Boreholes will be abandoned by a licensed driller. After the temporary PVC casing/screen is pulled from the hole, the remaining soil collected by the DPT rig will be containerized and appropriately disposed of as investigation-derived waste (IDW). The borehole will be filled with bentonite to within 6 in. of ground surface. The final 6 in. of each boring will be completed to match the surrounding ground cover.

7.4 SURVEY OF SAMPLE POINTS

All newly installed permanent monitoring wells will be surveyed by a professional licensed surveyor to determine location coordinates and elevations with an accuracy of ±0.1 ft horizontally and ±0.01 ft vertically. Vertical elevations will be referenced to the North American Vertical Datum of 1988. Horizontal positions determined by professional land survey based on National Spatial Reference System control points shall be determined with Third Order methods using a minimum of two reference points and reported reference to: (1) the appropriate State Plane Coordinate System, North American Datum 1983, local zone, U.S. Survey Feet; and (2) decimal degrees with World Geodetic System of 1984 (WGS84) as the earth datum. All subsequent geospatial data will be developed in the appropriate zone of the Universal Transverse Mercator Coordinate System, with WGS84 as the datum, and the meter unit of measure.

Coordinates for soil borings, temporary piezometers, surface water sample locations, and sediment sample locations will be obtained using GPS. Horizontal GPS coordinates will be collected in decimal degrees reported to seven decimal points, with WGS84 as the earth datum. In the event there is too much tree canopy for the GPS to work properly, distances will be measured from three reference points with known coordinates or recorded using the position offset feature of the GPS unit.

7.5 LOGS AND WELL INSTALLATION DIAGRAMS

7.5.1 Borehole Logs

A lithographic log form will be completed for each soil boring. Lithologic descriptions will follow the Unified Soil Classification System (American Society for Testing and Materials D2487 or D2488, depending on use of data). In addition, a narrative of drilling activities will be documented in the logbook. This narrative will include the sequence of all activities, descriptions of drilling equipment, quantities of materials used, and descriptions of any problems encountered.

7.5.2 Well Installation Diagrams

The newly installed monitoring well(s) and piezometers will be graphically depicted in an as-built well construction diagram, which will denote, by depth from the ground surface, the following information:

- Location of the borehole bottom and borehole diameter(s);
- Location of the well screen;

- Length of the well screen;
- Position of well screen relative to top of the water table;
- Location of any joints;
- Location of any centralizers;
- Location of the granular filter pack;
- Location of the bentonite seal;
- Location of the grout seal; and
- Height of riser (stick-up), without cap/plug, above the ground surface (if applicable).

Additional information to be described on each as-built well construction diagram will include the following:

- Actual quantity and composition of the grout seal, bentonite seal, and granular filter pack used for construction of the monitoring well;

- Screen slot size in inches, slot configuration, outside diameter, nominal inside diameter, schedule/thickness, composition, and manufacturer;

- Type of material located between the bottom of the borehole and the bottom of the screen;

- Outside diameter, nominal inside diameter, schedule/thickness, composition, and manufacturer of the well casing;

- Joint design and composition;

- Composition and nominal inside diameter of the protective casing;

- Dates and times for the start and completion of monitoring well installation; and

- Definition of any special abbreviations used at the first occurrence of their usage.

THIS PAGE INTENTIONALLY LEFT BLANK.

8.0 EQUIPMENT DECONTAMINATION PROCEDURES

To ensure that chemical analysis results are reflective of the actual concentrations at sampling locations, equipment used in sampling activities must be properly cleaned and decontaminated. Therefore, equipment used to conduct sampling activities will be decontaminated before sampling activities begin, between sampling activities, and after sampling activities have been completed. Information associated with the decontamination procedures to be used during the SI activities is summarized below.

8.1 SAMPLING EQUIPMENT

All sampling equipment, including stainless steel bowls and stainless steel sampling tools (e.g., spoons and auger buckets), will be washed, scrubbed with a laboratory-grade, non-phosphate detergent (i.e., Liquinox®), and rinsed with potable water first. Approved DI water will be used for all final rinses. The following procedure will be used:

1. Wash and scrub with, Liquinox®.
2. Rinse with potable water.
3. Rinse with DI, analyte-free water.
4. Air dry, as possible.

8.2 DRILLING EQUIPMENT

Decontamination of drilling equipment (e.g., down-hole drill rig equipment) will be performed prior to use and between borings. Equipment will be moved to a decontamination area where the equipment will be pressure washed or hand washed with potable water. Where DPT equipment is used, DPT rods will be decontaminated in the same manner as sampling equipment. Wastewater generated from decontamination activities will be handled as IDW, as outlined in Chapter 9.0, IDW Management.

THIS PAGE INTENTIONALLY LEFT BLANK.

9.0 INVESTIGATION-DERIVED WASTE MANAGEMENT

All field activities will be conducted to minimize the volume of IDW generated throughout the project. Solid IDW will be generated during drilling activities, while liquid IDW will be generated through drilling, decontamination, well development, and well purging activities. All IDW will be containerized and properly disposed of in accordance with Policy CEV 05-1, *Policy on Air National Guard Investigation and Remediation Derived Waste (IDW/RDW) Management* (ANG 2005). Each container of IDW (e.g., drum or tank) will be labeled with the type and source of material contained within, the date, and a Leidos point of contact (name and telephone number). IDW drum(s) will be properly stored on a pallet at a central accumulation point designated by the Base EM. Waste characterization (e.g., profiling) will be based upon the results of environmental sampling and site process knowledge. Leidos will provide the waste characterization profile for ANG review and will coordinate offsite transportation and disposal, as required. ANG will approve the identified disposal facility, sign the waste characterization profile (if applicable), and sign all waste manifests. Used personal protective equipment (i.e., nitrile gloves) and disposable equipment (e.g., paper towels and tubing) will be decontaminated to the extent possible, placed into plastic garbage bags, and disposed of as municipal waste.

THIS PAGE INTENTIONALLY LEFT BLANK.

10.0 DATA REQUIREMENTS

10.1 ENVIRONMENTAL RESOURCES PROGRAM INFORMATION MANAGEMENT SYSTEM

The Environmental Resources Program Information Management System (ERPIMS) is the U.S. Air Force's system for validation and management of data from environmental projects at all Air Force Bases. These data contain analytical chemistry samples, tests, and results, as well as hydrogeological information, site/location descriptions, and monitoring well characteristics. In September 2010, NGB issued a policy memorandum requiring all ANG environmental restoration sampling data to be submitted to the ERPIMS database beginning October 1, 2010 (ANG 2010b). This includes, but is not limited to, data from all environmental media (soil; groundwater, including water level and field parameter data; sediment; and surface water), lithologic data, and well construction data. Leidos will ensure that the analytical laboratory subcontracted for this field effort provides appropriate data for ERPIMS inclusion and will provide the required deliverable within 70 days of sampling in accordance with ANG guidance. If the goal of 70 days will not be met for any reason, Leidos will inform the ANG Program Manager and provide the rationale for delay.

10.2 GEOSPATIAL DATA DELIVERABLES

Leidos will comply with the requirements of Policy A7O 14-01, *Requirements for Geospatial Data Deliverables* (ANG 2014), for digital data collected during field activities and submitted to ANG. Environmental sample information will be submitted for inclusion into the Geographical Information System database per NGB Operations Division Restoration Branch Policy A7O 14-01 and to provide location requirements necessary for associated analytical results and field measurements to be included in ERPIMS.

THIS PAGE INTENTIONALLY LEFT BLANK.

11.0 PROJECT SCHEDULES AND DELIVERABLES

Table 11-1 summarizes the major elements of the SI and the anticipated dates of completion. A copy of the current project schedule is provided to ANG in each monthly progress report.

Table 11-1. Project Schedule for Major Elements of the SI

Task Title	Completion Date
SI Work Plan	April 2018
Draft	November 2017
Draft Final	January 2018
Final	April 2018
SI Field Activities	May/June 2018
SI Report	December 2018
Draft	August 2018
Draft Final	September 2018
Final	December 2018

SI = Site inspection.

12.0 REPORTING

12.1 PURPOSE

The SI findings will be documented in an SI Report. The purpose of the SI Report is to interpret the field and analytical results and to provide sufficient information to support a defensible NFA decision; provide general recommendations for future investigation activities; or an interim response action, if appropriate.

The report will document any deviations from this SI WP, present the rationale for sample locations, report field measurements, summarize investigation findings, and provide data interpretation. The report also will include soil boring logs, well completion logs, analytical data validation results, and electronic Geographic Information System data, as necessary.

12.2 FORMAT

The structure of the SI Report will follow the guidance presented in Appendix A of ANG's Investigation Guidance (ANG 2009).

12.3 DELIVERABLES

Draft, draft final, and final versions of the SI Report will be prepared. A draft report will be submitted to ANG, the Base EM, and the oversight contractor for review. Comments will be resolved, and a draft final report will be submitted for regulatory review. A final report that incorporates all ANG-approved comments will be submitted to ANG, the Base EM, and the oversight contractor. The final report will be available in the Administrative Record at http://afcec.publicadminrecord.us.af.mil/ Search.aspx.

WP	Work Plan

EXECUTIVE SUMMARY

Leidos has been tasked by the Air National Guard (ANG) to conduct site inspections (SIs) for perfluorinated compounds, herein referred to as perfluorooctane sulfonate/perfluorooctanoic acid (PFOS/PFOA), at multiple ANG Installations. The project scopes were outlined in the *Statement of Objectives for FY17 Phase III Regional Site Inspections for Perfluorinated Compounds at Multiple Air National Guard Installations*, Project Number ANGH20177151 (NGB 2017). Project management and quality control (QC) procedures are documented in the *Quality Control Plan for Fiscal Year 2017 Phase III Regional Site Inspections for Perfluorinated Compounds at Multiple Air National Guard Installations* (Leidos 2017).

This Uniform Federal Policy-Quality Assurance Project Plan (UFP-QAPP) details the investigative approach; provides the rationale for planned investigation activities; establishes the methods and procedures used in the investigation; identifies applicable QC criteria and quality assurance (QA) protocols; and documents the project organization, communication pathways, and schedule. The primary goal of this UFP-QAPP is to define procedures that will ensure the quality and integrity of the samples, accuracy and precision of the analyses, representativeness of the results, and completeness of the information collected during the SI. All data quality objectives and procedures associated with sample collection, laboratory analysis, sample custody, initial and continuing instrument/equipment calibration, internal QA checks, performance and system audits, preventive maintenance and scheduling, corrective action, and QA reports to management applicable to this project are described in this document.

The Installations included in the Phase III Regional SIs contract are listed in Table ES-1. Details pertaining to specific Installations are provided in Installation-specific SI Work Plans (WPs) tailored to the specific Installation. This UFP-QAPP is an attachment to each Installation-specific SI WP. Therefore, site-specific details are located in the SI WP, and this UFP-QAPP refers the reader to the SI WP for details.

Activities described in the SI WP include additional records review; confirmation of groundwater flow direction; and sampling of soil, groundwater, surface water, and sediment (if present). The goals of the SIs are to (1) determine the presence or absence of PFOS/PFOA in soil, surface water, or sediment (if present) at each potential release location (PRL) and in groundwater downgradient of PRLs; and (2) assess whether contamination from the Installation has migrated offsite. All SI activities will be conducted in compliance with the Comprehensive Environmental Response, Compensation, and Liability Act as amended; the National Oil and Hazardous Substances Pollution Contingency Plan; the Resource Conversation and Recovery Act; and the Statement of Objectives (NGB 2017).

Table ES-1. Phase III Project Installations and PRLs

Phase	Number	Installation	State	PRLs
III	1	Rosecrans Memorial Airport	MO	8
III	2	Lambert St. Louis International Airport	MO	5
III	3	Great Falls International Airport	MT	8
III	4	Des Moines International Airport	IA	14

QAPP Worksheets #1 and #2 – Title and Approval Page (continued)

Project Name: FY17 Phase III Regional SIs for PFOS/PFOA at Multiple ANG Installations

Site Location: Multiple Installations

Site Number/Code: Not applicable (N/A)

Operable Unit: N/A

Contractor Name: Leidos

Contract Number: W9133L-14-D-0007

Task Order Number: 0011

Contract Title: FY17 Phase III Regional SIs for Perfluorinated Compounds at Multiple ANG Installations

1. Identify guidance used to prepare QAPP:

- *Uniform Federal Policy for Quality Assurance Project Plans: Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs – Part 1: UFP-QAPP Manual* (IDQTF 2005a).
- *Workbook for Uniform Federal Policy for Quality Assurance Project Plans: Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs – Part 2A: UFP-QAPP Workbook* (IDQTF 2005b).
- *Uniform Federal Policy for Quality Assurance Project Plans – Part 2B, Quality Assurance/Quality Control Compendium: Minimum QA/QC Activities* (IDQTF 2005c).
- *Uniform Federal Policy for Quality Assurance Project Plans – Part 2A (Revised): Optimized UFP-QAPP Worksheets* (IDQTF 2012).
- *U.S. Department of Defense Quality Systems Manual for Environmental Laboratories*, Version 5.1 (DoD 2017).
- *Air National Guard Environmental Restoration Program Investigation Guidance* (ANG 2009).

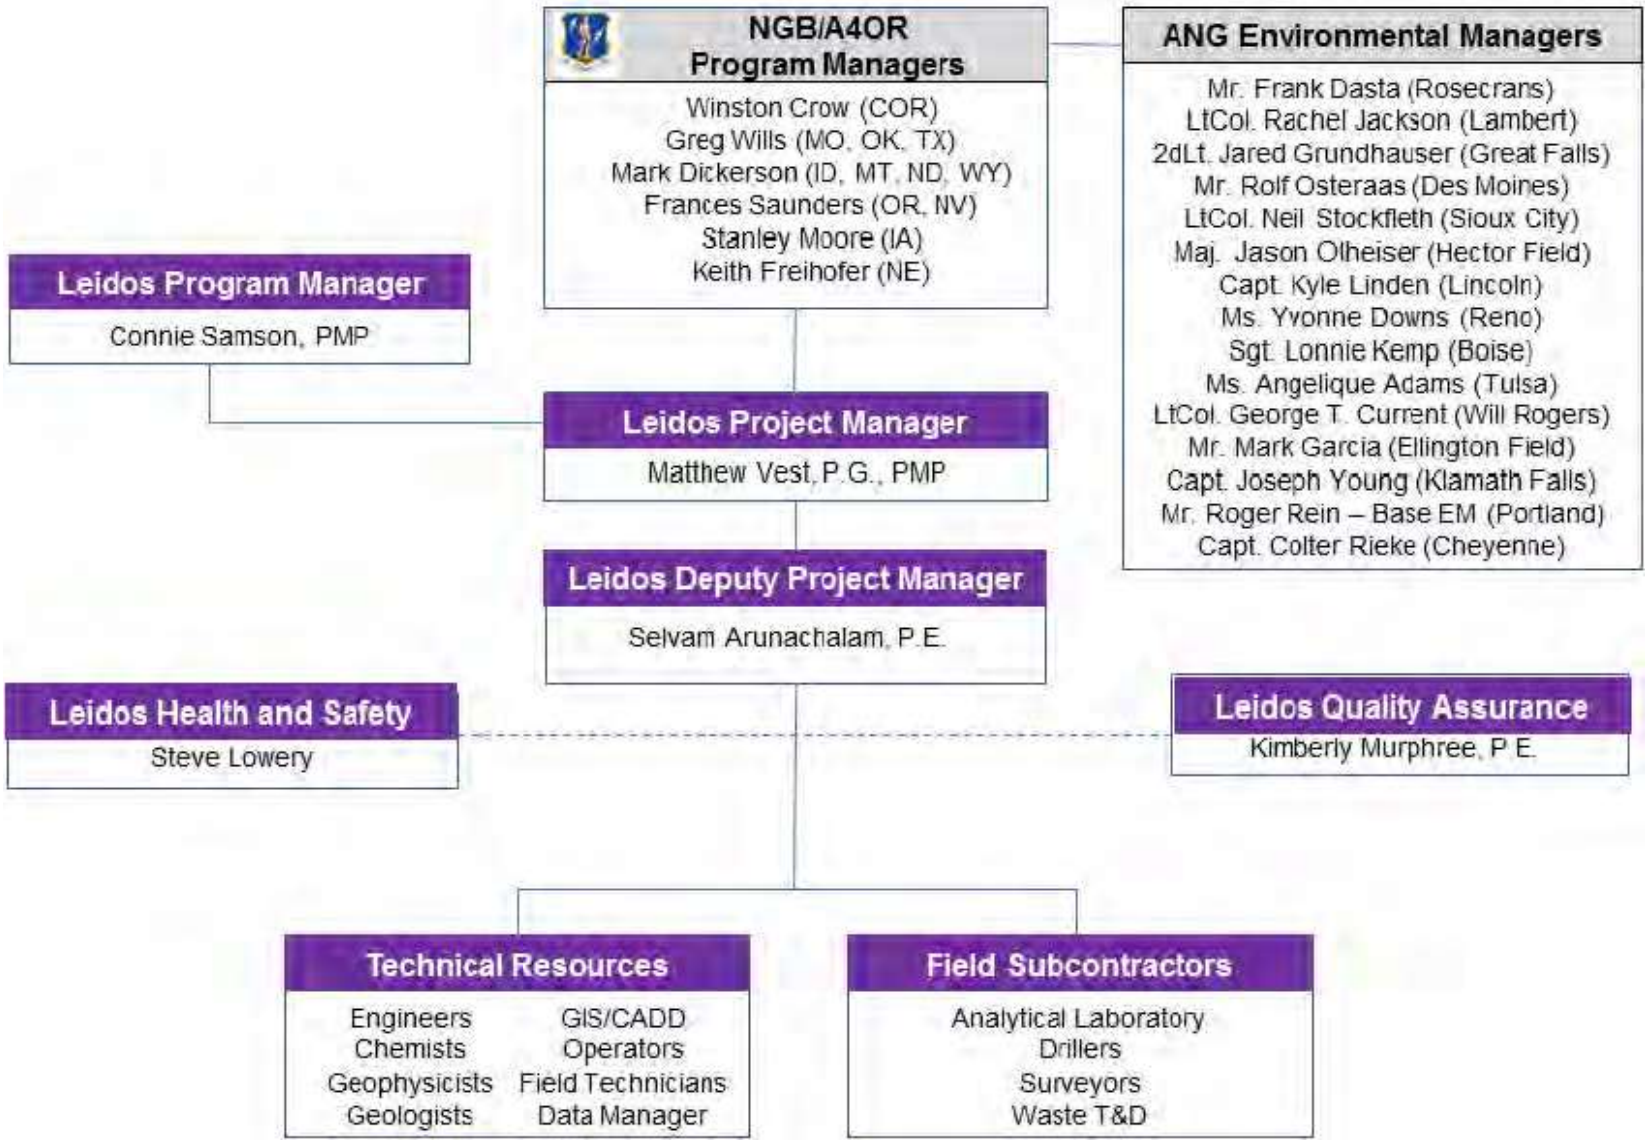
2. Identify regulatory program: NGB has lead regulatory authority over conducting the SIs. NGB will coordinate meetings, plans, and reports with each state environmental regulatory agency and make effort to obtain concurrence.

3. Identify approval entities: NGB signatory approval; state agency concurrence by formal letter will be obtained if possible but is not required for SIs.

4. Indicate whether the QAPP is Project-Specific: Yes, this UFP-QAPP is applicable to ANG Project Number ANGH20177151 and includes 15 Installations.

5. List dates of scoping sessions that were held: A project kickoff meeting was held at ANG Readiness Center, Joint Base Andrews, Maryland, on August 1, 2017. Subsequent Installation-specific kickoff meetings were held at each Installation on various dates. (See Installation-specific addenda for details.)

6. List dates and titles of QAPP documents written for previous work, if applicable: N/A



7. List organizational partners (stakeholders) and connection with lead organization: See item 2 above.

8. List data users: NGB/A4OR, state agencies, Leidos, Installations, and the public.

9. **If any required QAPP elements and required information are not applicable to the project, list the omitted QAPP elements and required information. Provide an explanation for their exclusion below:** All 37 QAPP worksheets are applicable, and information is included either in this UFP-QAPP or a reference is made to the Installation-specific SI Work Plan where site-specific details are included.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #6 – Communication Pathways

Communication Driver	Responsible Entity	Name	Procedure (Timing, Pathway, etc.)
POCs for ANG	NGB/A4OR	Winston Crow	Deliverables will be distributed to ANG and its oversight contractor (BB&E) by the Leidos PM/Staff Scientist. Routine status meetings will be held throughout the project for ANG, and informal communication will be conducted as needed. Leidos will submit Monthly Progress Reports to NGB/A4OR
	ANG Oversight Contractor	BB&E (see Worksheets #3 and #5)	
POCs for Installations	Installation EM	See Worksheets #3 and #5	Deliverables will be distributed to the Installation EM by the Leidos PM. Routine status meetings will be held throughout the project, and informal communication will be conducted as needed
POCs for state agencies	Varies by state (see Installation-specific addenda)	See Worksheets #3 and #5 (various)	Draft final deliverables will be distributed to state agencies by the Leidos PM. Routine status meetings will be held throughout the project if requested, and informal communication will be conducted as needed
POCs for Leidos	Leidos PMs	Matt Vest and Selvam Arunachalam	Deliverables will be distributed to ANG and its oversight contractor, state agencies, and the Installation EM by the Leidos PM. Leidos will present routine updates to stakeholders throughout the project, both through formal meetings and informal communications, as needed
Reporting data quality issues	Leidos Project Chemist	Joseph Peters	The need for corrective actions will be reported to the Leidos PM. Any flagging of data results will be reported to the Leidos Data Manager, who will notify the Leidos PM, if warranted
Changes to UFP-QAPP field sampling procedures	Leidos Field Manager(s)	TBD	Notify Leidos PM or Staff Scientist by phone and/or email of field-related problems and/or requested changes to field sampling or screening procedures
Stopping work due to health and safety issues or unexpected field conditions	Leidos Field Manager(s) and/or Site Health and Safety Officer(s)	TBD	Follow procedures outlined in the SSHP
Reporting sample receipt issues/laboratory data quality issues	Laboratory PM	ALS-Kelso: Kurt Clarkson TestAmerica: David Alltucker	All sample receipt issues and data quality issues will be reported to Leidos by phone or email as soon as possible after issues are identified

ANG = Air National Guard.
EM = Environmental Manager.
NGB/A4OR = National Guard Bureau Operations Division Restoration Branch.
PM = Project Manager.
POC = Point of contact.
SI = Site inspection.
SSHP = Site Safety and Health Plan.
TBD = To be determined. (Note: Multiple Field Managers [FMs]/Site Health and Safety Officers [SHSOs] will be required for project execution. The FM/SHSO identified for each Installation can be found on the Field Change Notice to the Site Safety Health Plan issued and approved prior to fieldwork execution.)
UFP-QAPP = Uniform Federal Policy Quality Assurance Project Plan.
WP = Work Plan.

QAPP Worksheet #9 – Project Scoping Session Participants Sheet

Project Name: Fiscal Year 2017 Phase III Regional Site Inspections For Perfluorinated Compounds at Multiple Air National Guard Installations **Projected Date (s) of Sampling:** January 2018 through August 2018 **Project Manager:** Matthew Vest	**Site Name:** Air National Guard Readiness Center **Site Location:** Joint Base Andrews, Maryland
Date of Session: August 1, 2017 **Scoping Session Purpose:** Post-Award Project Kickoff Meeting	

Post-Award Project Kickoff Meeting

A post-award kickoff meeting was held on August 1, 2017, at Joint Base Andrews, Maryland. The final meeting minutes for the Phase III project and list of attendees are listed below.

FINAL PROJECT KICKOFF MEETING MINUTES
for
FY17 Phase III Regional Site Inspections
for Perfluorinated Compounds
at
Multiple Air National Guard Installations

PROJECT NUMBER: ANGH20177151

Air National Guard Readiness Center
Joint Base Andrews, Maryland

Contract Number W9133L-14-D-0007

Task Order Number 0011

1 August 2017

Meeting Participants:

- Mr. Dennis Pinigis – NGB/A4OR Technical Advisor, Senior Program Manager;
- Mr. Winston Crow – NGB/A4OR Program Manager/Contracting Officer's Representative (COR) for TO 0011 (PFC Phase III);
- Mr. Stan Moore – NGB/A4OR Program Manager/COR for TO 0009 (PFC Phase IV) (via teleconference);
- Ms. Susan Klypchak – NGB Contracting Specialist (via teleconference);
- Mr. Greg Wills – NGB/A4OR Program Manager;
- Mr. Mark Dickerson – NGB/A4OR Program Manager;
- Ms. Fran Saunders – NGB/A4OR Program Manager;
- Mr. Keith Freihofer – NGB/A4OR Program Manager (via teleconference);
- Mr. Brant Crumbling – NGB/A4OR Program Manager;
- Ms. Connie Samson – Leidos Program Manager;
- Mr. Matt Vest – Leidos Project Manager (PFC Phase III);
  Mr. Selvam Arunachalam – Leidos Deputy Project Manager (PFC Phase III);

- Mr. Mark Kidder – Leidos Project Engineer (via teleconference);
- Mr. Mike Poligone – Leidos Project Manager (PFC Phase IV);
- Mr. Matt Machusick – Leidos Project Geologist (PFC Phase III and Phase IV);
- Mr. Aaron Etnyre – BB&E Oversight;
- Mr. Doug Barber – BB&E Oversight; and
- Mr. Jim Colmer – BB&E Oversight (via teleconference).

The meeting for Task Order (TO) 0011 (Phase III Site Inspection [SI] for Perfluorinated Compounds [PFCs]) commenced at 0900 Eastern Daylight Time (EDT) once all teleconference attendees were on the line. Mr. Winston Crow (NGB/A4OR) began the presentation.

Following introductions, Mr. Crow presented the general contract information, Statement of Objectives requirements, protocols, and Air National Guard (ANG) expectations for the TO.

Mr. Matt Vest (Leidos) began the Leidos portion of the presentation and discussed the project goals and objectives, execution plan, project roles and responsibilities, channels of communication, and the project schedule. Mr. Selvam Arunachalam (Leidos) presented the overall technical approach for the SI and provided an example of the proposed sampling approach for the potential release locations (PRLs) at one of the ANG Bases.

Mr. Dennis Pinigis (NGB/A4OR) said that the term PFC should not be used in future meeting presentations and SI Work Plans (WPs) and Reports. It was agreed that perfluorooctane sulfonate/perfluorooctanoic acid (PFOS/PFOA) will replace any reference to PFC in all public documents.

Mr. Doug Barber (BB&E) requested that the groundwater flow direction be shown in the figures included in the SI WP. Mr. Aaron Etnyre (BB&E) mentioned that they are not seeing much PFOS/PFOA in soil, sediment, and surface water samples from PRLs and suggested focusing on groundwater due to the mobility of these compounds. Mr. Etnyre also suggested the sampling approach at hangar locations should consider the possibility of aqueous film-forming foam overflow into the ramp area outside the building.

Mr. Crow requested the contractor periodically check state regulations for updates to PFOS/PFOA requirements. Mr. Pinigis requested a spreadsheet showing the fieldwork start date and the Final SI Report date for each Installation included in the TO. Mr. Crow requested the Monthly Progress Reports include data on the number of employees that worked on the project.

The need for SI WPs in Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) format was discussed in detail, and concerns were expressed regarding regulator familiarity with the UFP-QAPP format and the potential for increased review timeframes. It was agreed that a single project-wide UFP-QAPP will be developed and included as an appendix to the Installation-specific sampling and analysis plans. BB&E suggested that the project-wide UFP-QAPP and the sampling and analysis plan for one Installation be submitted for ANG and BB&E review before submitting additional Installation-specific sampling and analysis plans. This approach would minimize repetitive comments and accelerate WP submittal to regulators.

Mr. Greg Wills (NGB/A4OR) indicated the termination of lease is in process with the Air Force Civil Engineer Center for a portion of Lambert ANG Base, and some of the leased property will go back to the airport. Once this occurs, a right of entry authorization will need to be obtained to conduct the SI fieldwork. Ms. Fran Saunders (NGB/A4OR) mentioned that Installations in Portland, Oregon, and Ohio have received a high level of concern from the state regulators and will likely require acceleration of field schedule.

The meeting for TO 0011 adjourned at approximately 10:30 EDT.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #10 – Problem Definition/Conceptual Site Model

In 2012, the U.S. Environmental Protection Agency (EPA), under the Safe Drinking Water Act, published the third Unregulated Contaminant Monitoring Rule (UCMR3), which required public water supplies across the country to sample for a list of 30 unregulated contaminants, including the 6 perfluorinated compounds—perfluorooctane sulfonate (PFOS), perfluorooctanoic acid (PFOA), perfluorobutane sulfonate (i.e., PFBS), perfluorononanoic acid (i.e., PFNA), perfluoroheptanoic acid (i.e., PFHpA), and perfluorohexane sulfonate (i.e., PFHxS), hereafter collectively referred to as PFOS/PFOA. Results of the UCMR3 indicated detections of PFOS/PFOA at numerous locations, including several near U.S. Department of Defense (DoD) facilities. In general, PFOS/PFOA detections related to DoD facilities are often linked to the use of aqueous film-forming foam (AFFF), which contains PFOS/PFOA. AFFF is used as a firefighting agent to suppress fires involving petroleum hydrocarbons. As PFOS/PFOAs are emerging contaminants, they have not been historically analyzed during site characterizations; therefore, minimal sampling data exist for most sites.

In 2016, EPA issued a drinking water health advisory for PFOS/PFOA. The health advisory is 70 nanograms per liter (ng/L) for the combined total of PFOS and PFOA. When AFFF is released to the environment, PFOS/PFOA can migrate into soil and groundwater. Once in the environment, the compounds are persistent and may migrate through erosion, surface water, groundwater, and/or biologic uptake. The amount of PFOS/PFOA that enters the environment depends on the type and amount of AFFF used, where and when it was used, the type of soil, and other factors. If private or public wells are located nearby, they could potentially be affected by PFOS/PFOA. Similarly, surface water features may be impacted and may convey PFOS/PFOA to downgradient receptors. Potential environmental releases of AFFF at Air National Guard Installations include, but are not limited to, the following locations and activities:

- Firefighting training areas;
- Fire stations;
- Fire truck equipment testing and maintenance areas;
- Aircraft for fuel emergency response activities;
- Testing or emergency activation of AFFF fire suppression systems in hangars and buildings;
- Fire suppression system releases in hangers and buildings due to malfunctions;
- Other spills and releases; and
- Storm water and/or surface water via drainage canals, outfalls, wastewater treatment plants, or AFFF ponds.

The conceptual site model varies between Installations; therefore, additional details for each Installation are presented in Section 6.2.2 of the Installation-specific Site Inspection Work Plan.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #11 – Project Quality Objectives/Systematic Planning Process Statements

This worksheet documents the problem statement and project goals, identifies the information inputs and boundaries of the site inspection (SI), and provides a high-level overview of the investigative approach more specifically detailed in subsequent worksheets.

A. Problem Statement

Preliminary assessments (PAs) conducted by the Air National Guard (ANG) surveillance and oversight contractor, BB&E, have identified numerous potential release locations (PRLs) at each of the Installations. SI activities are being conducted to determine the presence or absence of perfluorooctane sulfonate/perfluorooctanoic acid (PFOS/PFOA) in soil, groundwater, surface water, and sediment (if present) at the PRL and in groundwater immediately downgradient of PRLs at the Installation outfall (if present).

B. Project Goals

In accordance with the Statement of Objectives (NGB 2017), project goals include the following:

For all Installations listed in Table ES-1, conduct SI activities, including determining the presence or absence of PFOS/PFOA in all media, including surface and subsurface soils at each PRL; groundwater samples immediately downgradient of each PRL; and sediment and surface water (if present, for example at outfalls), and determine if PFOS/PFOA-contaminated groundwater has reached the Installation boundary. Sampling shall only be performed on ANG property. For the off-Installation stormwater outfalls, wet wells, drainage basins, and drainage ditches, SI activities will use the last-available downgradient location that is still on ANG property for a sample site location. Existing monitoring wells, if available, will be utilized as feasible, and any new monitoring wells will be developed prior to sampling.

C. Information Inputs

Primary information inputs on this project include:

- Analytical results of the soil, sediment, groundwater, and surface water sampling outlined in the SI Work Plan (WP).
- Field observations made during preliminary site visits and execution of field activities (e.g., determination of soil lithology, measured depth to water table, etc.).
- Secondary data listed in Worksheet #13.

D. Study Boundaries and Target Analytes

SI activities target PRLs identified during the PA and are limited to areas located within the Installation property boundary. Target analytes for SI activities are the six PFOS/PFOAs included in third Unregulated Contaminant Monitoring Rule (i.e., UCMR3). Soil, groundwater, sediment, and surface water (if present) will be analyzed for to determine if these six compounds are present.

E. Analytic Approach

Worksheet #18 outlines the samples that will be collected and analyzed to meet project goals. Groundwater samples will represent conditions immediately downgradient of PRLs and at the Installation boundary; soil, sediment, and surface water samples will represent the media at each collection location.

F. Performance and Acceptance Criteria

PFOS/PFOA delineation will be completed by identifying areas where PFOS/PFOAs are detected and/or exceed available action limits, as available (see Worksheet #15). Performance and acceptance will be achieved through application of the quality assurance/quality control methods and procedures outlined within this Uniform Federal Policy Quality Assurance Project Plan, and ultimately determined through ANG approval of and regulatory concurrence with the final results, as presented in subsequent SI Reports.

G. Detailed Plan for Obtaining Data

Worksheet #17 provides the basis for proposed sampling, with individual sample details provided in Worksheet #18. Worksheets #19 and #30, #20, and #24 through #28 provide specific design analytical requirements. Additional details are provided in the SI WP.

QAPP Worksheet #12 – Measurement Performance Criteria Table (PFOS/PFOA in Waters and Soils)

Matrix: Water and soil **Analytical Group:** PFOS/PFOA **Concentration Level:** All levels **Analytical Method/ Standard Operating Procedure**	**Data Quality Indicator**	**Measurement Performance Criteria**[a]	**QC Sample and/or Activity Used to Assess Measurement Performance**	**QC Sample Assesses Error for Sampling (S), Analytical (A) or Both (S&A)**
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Accuracy/Bias	Standards containing both branched and linear isomers must be used when commercially available	ICAL, CCVs, and spiking solutions	A
DoD QSM, version 5.1, Table B-15	Sensitivity Accuracy/Bias	Analyte concentrations at LOQ must be within ±30% of true value	ISC	A
DoD QSM, version 5.1, Table B-15	Accuracy/Bias Instrument Contamination	No analytes detected >1/2 LOQ	Instrument blank	A
EPA Method 537, revision 1.1 modified	Accuracy/Bias Field Environment Contamination	Not applicable; if target analytes are detected in the field QC blank, then associated field samples will be evaluated for potential sampling and/or field environment contamination. If field sample detects are within five times the field QC blank results, then the field sample result is qualified as non-detect	Field blank, equipment rinse blank, field reagent blank	S & A
DoD QSM, version 5.1, Table B-15	Accuracy/Bias	50% to 150% of true value	Extraction internal standards	A

QAPP Worksheet #12 – Measurement Performance Criteria Table (PFOS/PFOA in Waters and Soils) (continued)

Matrix: Water and soil **Analytical Group:** PFOS/PFOA **Concentration Level:** All levels **Analytical Method/ Standard Operating Procedure**	**Data Quality Indicator**	**Measurement Performance Criteria**[a]	**QC Sample and/or Activity Used to Assess Measurement Performance**	**QC Sample Assesses Error for Sampling (S), Analytical (A) or Both (S&A)**
DoD QSM, version 5.1, Table B-15	Accuracy/Bias	-50% to +50% of peak area of ICAL midpoint or CCV	Injection internal standards	A
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Accuracy/Bias	Laboratory analyte recovery in-house limits; RPD ≤30%	LCS	A
EPA Method 537, revision 1.1 modified	Accuracy/Bias	70 to 130%; Note: Surrogates are not a DoD QSM, version 5.1 requirement because isotope dilution methods use the extraction internal standard for analyte quantitation. The use of surrogates will be optional, depending on the laboratory method requirements	Surrogate	A
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Accuracy/Laboratory Contamination	No analytes detected >1/2 LOQ or >1/10 the amount measured in any samples or 1/10 the regulatory limit, whichever is greater	Method blank	A
EPA Method 537, revision 1.1 modified	Accuracy/Bias Precision	Laboratory LCS analyte recovery in-house limits; RPD ≤30%	MS/MSD	A

QAPP Worksheet #12 – Measurement Performance Criteria Table (PFOS/PFOA in Waters and Soils) (continued)

Matrix: Water and Soil **Analytical Group:** PFOS/PFOA **Concentration Level:** All levels **Analytical Method/ Standard Operating Procedure**	**Data Quality Indicator**	**Measurement Performance Criteria**[a]	**QC Sample and/or Activity Used to Assess Measurement Performance**	**QC Sample Assesses Error for Sampling (S), Analytical (A) or Both (S&A)**
DoD QSM, version 5.1, Table B-15	Accuracy/Bias	70 – 130% recovery	Post-spike sample; only applies to results <LOQ in aqueous samples prepared by serial dilution method. Spiking must occur at the LOQ	A
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Overall Precision	RPD ≤50% when both samples ≥sample-specific LOQ	Field duplicate	S&A
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Completeness	90%	Reported sample data	S&A
EPA Method 537, revision 1.1 modified; DoD QSM, version 5.1, Table B-15	Comparability	Based on accuracy and media comparison	Use of standardized Standard Operating Procedures in field and laboratory	S&A

[a] Laboratory in-house limits are included immediately following this worksheet.
CCV = Continuing calibration verification.
DoD = U.S. Department of Defense.
EPA = U.S. Environmental Protection Agency.
ICAL = Initial calibration.
ISC = Instrument sensitivity check.
LCS = Laboratory control sample.
LOQ = Limit of quantitation.
MS = Matrix spike.
MSD = Matrix spike duplicate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
QC = Quality control.
QSM = Quality Systems Manual.
RPD = Relative percent difference.

Laboratory In-House Quality Control Limits

Laboratory	Analyte	CAS	Matrix	LCS %Rec	MS %Rec	RPD
ALS-Kelso	Perfluorooctanoic acid (PFOA)	335-67-1	Water	72 – 130	72 – 130	30
ALS-Kelso	Perfluorononanoic acid (PFNA)	375-95-1	Water	77 – 127	77 – 127	30
ALS-Kelso	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Water	74 – 135	74 – 135	30
ALS-Kelso	Perfluorobutane sulfonic acid (PFBS)	375-73-5	Water	70 – 127	70 – 127	30
ALS-Kelso	Perfluoroheptanoic acid (PFHpA)	375-85-9	Water	67 – 142	67 – 142	30
ALS-Kelso	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Water	71 – 130	71 – 130	30
ALS-Kelso	Perfluorononanoic acid (PFNA)	375-95-1	Soil	50 – 150	50 – 150	50
ALS-Kelso	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Soil	50 – 150	50 – 150	50
ALS-Kelso	Perfluorooctanoic acid (PFOA)	335-67-1	Soil	50 – 150	50 – 150	50
ALS-Kelso	Perfluorobutane sulfonic acid (PFBS)	375-73-5	Soil	50 – 150	50 – 150	50
ALS-Kelso	Perfluoroheptanoic acid (PFHpA)	375-85-9	Soil	50 – 150	50 – 150	50
ALS-Kelso	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluorooctanoic acid (PFOA)	335-67-1	Water	80 – 120	80 – 120	30
TestAmerica	Perfluorononanoic acid (PFNA)	375-95-1	Water	77 – 137	77 – 137	30
TestAmerica	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Water	83 – 126	83 – 126	30
TestAmerica	Perfluorobutane sulfonic acid (PFBS)	375-73-5	Water	88 – 130	88 – 130	30
TestAmerica	Perfluoroheptanoic acid (PFHpA)	375-85-9	Water	89 – 127	89 – 127	30
TestAmerica	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Water	87 – 126	87 – 126	30
TestAmerica	Perfluorononanoic acid (PFNA)	375-95-1	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluorooctanoic acid (PFOA)	335-67-1	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluorobutane sulfonic acid (PFBS)	375-73-5	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluoroheptanoic acid (PFHpA)	375-85-9	Soil	50 – 150	50 – 150	50
TestAmerica	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Soil	50 – 150	50 – 150	50

Note: TestAmerica's in-house accuracy and precision limits for soil are temporary and will be updated once in-house limits are established.
CAS = Chemical Abstracts Service.
LCS = Laboratory control sample.
MS = Matrix spike.
%Rec = Percent recovery.
RPD = Relative percent difference.

QAPP Worksheet #12 – Measurement Performance Criteria Table (PFOS/PFOA in Waters and Soils) (continued)

A. Precision

Precision is the measure of the degree of reproducibility exhibited by a set of replicate results or the agreement among repeat observations made under the same conditions. Precision is usually expressed as standard deviation, relative percent difference (RPD), or range, in either absolute or relative terms. Precision will be determined through the use of spike analyses conducted on duplicate pairs of laboratory and environmental samples (matrix spike/matrix spike duplicates [MS/MSDs]) or comparison of laboratory duplicate responses. The RPD between two positive results will be calculated and used as a quality control (QC) indication of the field procedures, matrix effects, and precision of the analyses conducted. In instances where there is no MS/MSD associated with a sample delivery group (SDG), the laboratory control sample/laboratory control sample duplicate (LCS/LCSD) will be used to access precision.

The precision of the laboratory analytical processes will be determined through evaluation of LCS/LCSD analyses. The standard deviation of these measurements over time will provide confidence that implementation of the analytical protocols was consistent and acceptable. The RPD associated with each LCS/LCSD pair will be used to access laboratory precision for SDGs that do not have an associated MS/MSD pair. These measurements will establish the precision of the laboratory analytical process.

Precision of the field sampling process will be determined through the evaluation of field duplicate samples. Field duplicate acceptance criteria will be set at 50 RPD.

Environmental sample matrix precision will be assessed by comparing the analytical results between MS/MSD analyses and laboratory duplicates and field duplicates for each analytical parameter. The RPD will be calculated for each pair of duplicate analysis using Equation (1) and will produce an absolute value for RPD. This precision measurement is impacted by variables associated with the analytical process, influences related to sample matrix interferences, consistent implementation of sampling procedures, and degree of sample homogeneity.

$$RPD = \frac{|S - D|}{\frac{(S + D)}{2}} \times 100 \qquad (1)$$

where

S = First sample value (original value),
D= Second sample value (duplicate value).

B. Accuracy/Bias

Accuracy is the nearness of a result, or the mean of a set of results, to the true or accepted value; bias describes the systematic or persistent distortion associated with a measurement process. The terms accuracy and bias are used interchangeably in this document. Analytical accuracy is expressed as the percent recovery (%R) of an analyte that has been added to a blank sample or environmental sample, at a known concentration, during or after sample preparation. Accuracy will be determined in the laboratory through the use of MS and MSD analyses, and, if necessary, LCS analyses and blank spike analyses. The percent recovery for specific target analytes will be calculated and used as a QC indication of the field procedures, matrix effects, and accuracy of the analyses conducted.

The accuracy of the laboratory analytical measurement process and analytical equipment accuracy will be determined by analyzing LCS and continuing calibration verification (CCV) samples. The percent recovery of blank spike samples (e.g., LCS and CCV) will be calculated using Equation (2). One LCS sample will be analyzed for every matrix and analytical batch. The rate of CCV samples will differ depending on the analytical method.

$$\%R = \frac{A}{B} \times 100 \qquad (2)$$

where

A = The analyte concentration determined experimentally from the spiked sample,
B = The true or accepted value of the spiked sample.

Environmental sample accuracy will be assessed for compliance with the established QC criteria that are described for each analyte in this worksheet using the analytical results of method blanks, MS/MSDs, LCSs, and field QC blanks (field blanks, equipment rinsate blanks, and field reagent blanks). All method blanks must be below one-half of the limit of quantitation (LOQ) or below one-tenth of the amount measured in any associated sample for all analytes, with the exception of common laboratory contaminants, which must be below the LOQ or one-tenth of the amount measured in any associated sample. The percent recovery of MS samples will be calculated using Equation (3). This accuracy measurement is impacted by variables associated with the analytical process, influences related to sample matrix interferences, consistent implementation of sampling procedures, and degree of sample homogeneity.

$$\%R = \frac{A - B}{C} \times 100 \qquad (3)$$

where

A = The analyte concentration determined experimentally from the spiked sample,
B = The background level determined by a separate analysis of the unspiked sample,
C = The amount of spike added.

C. Sensitivity and Quantitation Limits

The sensitivity of an analytical method/instrumentation is a measure of the ability of the test method/instrumentation to meet prescribed minimum levels for reporting. Sensitivity is a significant consideration in the selection of an analytical method(s) that can achieve project-specific data quality objectives. For this project, analytical requirements for sensitivities are represented by laboratory-specific method detection limits (DLs), limits of detection (LODs), and LOQs. The DL is the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. Although a result at or above the DL indicates that the analyte is present, the absence of a result at or above the DL is inconclusive (i.e., one cannot confidently state whether the analyte is present or absent), because the false-negative rate at the DL is 50%. The DL is determined periodically by the laboratory from analysis of a sample of a given matrix type containing the analyte of interest. Because DLs are updated frequently, the laboratory is required to provide updated DLs

to Leidos as they become available throughout the duration of the project. The LOD is the smallest amount or concentration of a substance that must be present in a sample to be detected at a 99% confidence level. In other words, if a sample has a true concentration at the LOD, there is a minimum probability of 99% of reporting a "detection" (a measured value ≥DL) and a 1% chance of reporting a non-detect (a false-negative). Per the U.S. Department of Defense (DoD) Quality Systems Manual (QSM), version 5.1 (DoD 2017) requirements, samples that are non-detect for a particular analyte/compound should be reported as the LOD, followed by the laboratory qualifier (U), indicating the analyte/compound was not detected at the laboratory LOD. Per DoD QSM requirements, an instrument sensitivity check (ISC) is analyzed prior to sample analysis and every 12 hr. The ISC is a standard with analyte concentrations at the LOQ and is used to confirm that the analytical instrument is capable of accurately achieving the LOQ values for the target compounds of interest. Laboratory DLs, LODs, and LOQs are laboratory-specific and will be provided in the Installation-specific Site Inspection Work Plans. However, method and instrument sensitivity are able to achieve DL, LOD, and LOQ values well below project action levels for perfluorooctane sulfonate (i.e., PFOS) and perfluorooctanoic acid (i.e., PFOA). Action levels, as applicable, are provided in Worksheet #15.

D. Representativeness

Representativeness is the term most associated with the proper design of the sampling program. Representativeness qualitatively expresses the degree to which data accurately reflect site conditions. Factors that affect the representativeness of analytical data include appropriate sample population definitions, proper sample collection and preservation techniques, analytical holding times, use of standard analytical methods, and determination of matrix or analyte interferences.

E. Comparability

Comparability is a qualitative term that relates a project data set to other data sets. This investigation will employ narrowly defined sampling methodologies, use of standard sampling procedures and equipment, uniform training, documentation of sampling, standard analytical protocols/procedures, QC checks with standard control limits, and universally accepted data reporting units to ensure comparability to other data sets. Through proper implementation and documentation of these standard practices, the project will establish confidence that data will be comparable to other project and programmatic information.

F. Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount of data expected under normal conditions. It is expected that the laboratory will provide data meeting system QC acceptance criteria for all samples tested. Overall project completeness goals take into account the potential for sample losses (e.g., due to breakage) and potential data losses (e.g., due to severe matrix interferences).

Project completeness will be determined by evaluating the planned versus actual data. All data not flagged as rejected by the review, verification, validation, or assessment processes will be considered valid. The sample data quality completeness goal is 90%.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #13 – Secondary Data Criteria and Limitations Table

Secondary Data	Data Source/Generator	How Data Will Be Used	Limitations on Data Use[a]
Historical data, including photographs, aerial photographs, and/or topographic maps	Various, including records obtained by Leidos and those previously obtained by BB&E during the PAs	Contribute to the understanding of historical activities and site conditions as they pertain to potential and/or known PFOS/PFOA source areas	When a direct copy of the original is available (e.g., a photocopy of a UST record or well construction diagram), the original should be included in an appendix to the report if not otherwise readily available (e.g., in the Administrative Record). When the historical data were obtained via a secondary source (e.g., another report), the source must be clearly cited in the Leidos document
Background information	Various, including reports prepared by other ANG or DoD contractors	Contribute to the understanding of historical activities and site conditions as they pertain to potential and/or known PFOS/PFOA source areas	Minimal limitations as reports from which information is obtained will either have been prepared by a reputable source (e.g., USAF) and/or were reviewed and accepted by regulatory agencies and/or DoD agencies (e.g., those prepared by contractors)
Existing hydrologic/geologic/ hydrogeologic studies	DoD contractors' historical reports (e.g., ANG and USAF)	Hydrologic, geologic, and hydrogeologic characterization, inclusive of detailed drawings and hydrogeologic cross-sections	Minimal limitations as reports from which information is obtained will either have been prepared by a reputable source (e.g., USAF) and/or were reviewed and accepted by regulatory agencies and/or DoD agencies (e.g., those prepared by contractors)
Interviews	Current and former Installation personnel	Contribute to the understanding of historical activities and site conditions as they pertain to potential and/or known PFOS/PFOA source areas	Information obtained from interviews must be attributed to the individual by name if presented within the report; in addition, attempts should be made to verify all verbal information through a second corroborating source. As sampling and analysis will provide primary data confirming the presence/absence of PFOS/PFOAs in environmental media, any uncertainty associated with verbal information provided during interviews is not a significant concern (e.g., no decisions will be made based upon this information)
Analytical data collected during prior or concurrent investigations	Various	Contribute to the understanding of current PFOS/PFOA distribution in groundwater throughout the area	Minimal limitations as reports from which information is obtained will either have been prepared by a reputable source (e.g., USAF) and/or were reviewed and accepted by regulatory agencies and/or DoD agencies (e.g., those prepared by contractors)

[a] All uses of secondary data by Leidos will include the source from which the data were obtained and a statement of any limitations that may apply. For instance, background statements obtained from prior reports will be cited in the text and the source document included in the list of references. Analytical data presented in tables or figures that were not generated by Leidos during the course of this project will have a footnote with the source clearly identified or similar.

ANG = Air National Guard.
DoD = U.S. Department of Defense.
PA = Preliminary assessment.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
USAF = U.S. Air Force.
UST = Underground storage tank.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheets #14 and #16 – Project Tasks and Schedule

The baseline project schedule, which has an 18-month period of performance beginning July 14, 2017, is provided in Exhibit 1. The following primary tasks make up the project scope:

- Task 1. Project Management and Meetings.
  - 1.1 Project Kickoff Meetings,
  - 1.2 Installation Kickoff Meeting,
  - 1.3 Regulatory Meetings, and
  - 1.4 Monthly Progress Reports (MPRs).
- Task 2. Quality Control Plan (QCP).
- Tasks 3 through 17. Installation-Specific Tasks (i.e., Task 3 is Rosecrans Memorial Airport, Missouri). An example of the Task 3 subtasks is shown below and is common to the remaining Tasks 4 through 17.
  - 3.1 Site Inspection (SI) Work Plan (WP),
  - 3.2 SI Fieldwork, and
  - 3.3 SI Report.

Task 1 includes Leidos project management and meetings. Subtask 1.1 is the project kickoff meeting, which was held on August 1, 2017 (see Worksheet #9).

Subtask 1.2 includes a kickoff meeting to be conducted at each Installation, which includes the Air National Guard (ANG) Project Managers (PMs), Installation Environmental Managers (EMs), key Installation personnel, and applicable regulatory agencies. Leidos will prepare the agenda, deliver any necessary briefings, and prepare and submit meeting minutes for all meetings.

Subtask 1.3 includes regulatory or project update meetings with the ANG PMs, Installation EMs, and applicable regulatory agencies to discuss current results and obtain consensus among stakeholders on project status.

Subtask 1.4 includes the submittal of MPRs to the ANG PMs throughout the duration of the project to facilitate team communication and to verify project status. The MPRs will summarize the past month's activities; anticipated activities for the next month; recommendations; any technical, regulatory, and administrative issues; and status of the project schedule, including past due items, pending invoices, and any other action items.

Task 2 includes development of a QCP to ensure that project objectives are achieved for each ANG Installation. The QCP provides (1) an organizational depiction of the project team and chain(s)-of-command; (2) clear steps of project execution that will ensure technically sound, high-quality products are submitted and schedule is maintained; (3) effective communication with ANG and stakeholders by depicting project team, roles and responsibilities of personnel, and chain-of-command; and (4) corrective action procedures that will be implemented if deficiencies are noted. The final QCP (Leidos 2017) was issued on August 25, 2017.

Task 3 is the Rosecrans Memorial Airport.

Task 3.1 includes the development of Installation-specific SI WPs, which include this Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) and a Site Safety and Health Plan (SSHP) as appendices. This UFP-QAPP will be submitted for ANG review as a draft version, followed by a draft final version for regulatory input; however, per the Statement of Objectives (NGB 2017), regulator concurrence is encouraged but not required. The SSHP will be prepared in draft and final versions, with the draft submitted to ANG for review and comment.

Task 3.2 includes all soil, groundwater, surface water, and sediment sampling. The SI WP further describes planned field components of the SI activities in their anticipated chronological order.

Task 3.3 includes the preparation of SI Reports to document results of the investigation and provide conclusions and recommendations.

Exhibit 1. Project Schedule

[11x17, 4 pages, 35 - 38]

QAPP Worksheet #15a – Reference Limits and Evaluation Table (PFOS/PFOA in Waters)

Laboratory	Analyte	CAS Number	Project Action Limit (ng/L)	Achievable Laboratory Limits (ng/L)[c]		
				DL	LOD	LOQ
ALS-Kelso	Perfluorooctanoic acid (PFOA)	335-67-1	70 [a]	0.27	0.8	5.0
ALS-Kelso	Perfluorononanoic acid (PFNA)	375-95-1	N/A	0.51	1.2	5.0
ALS-Kelso	Perfluoroheptanoic acid (PFHpA)	375-85-9	N/A	0.31	1.2	5.0
ALS-Kelso	Perfluorobutanesulfonate (PFBS)	375-73-5	400,000[b]	0.41	1.2	5.0
ALS-Kelso	Perfluorohexane sulfonate (PFHxS)	355-46-4	N/A	0.35	1.2	5.0
ALS-Kelso	Perfluorooctane sulfonate (PFOS)	1763-23-1	70[a]	0.60	1.2	5.0
TestAmerica	Perfluorooctanoic acid (PFOA)	335-67-1	70 [a]	0.85	2.0	4.0
TestAmerica	Perfluorononanoic acid (PFNA)	375-95-1	N/A	0.27	1.0	2.0
TestAmerica	Perfluoroheptanoic acid (PFHpA)	375-85-9	N/A	0.25	1.0	2.0
TestAmerica	Perfluorobutanesulfonate (PFBS)	375-73-5	400,000[b]	0.30	1.0	2.0
TestAmerica	Perfluorohexane sulfonate (PFHxS)	355-46-4	N/A	0.30	1.0	2.0
TestAmerica	Perfluorooctane sulfonate (PFOS)	1763-23-1	70[a]	0.54	2.0	4.0

[a] Project action limits (U.S. Environmental Protection Agency [EPA] health advisory levels) for groundwater and surface water are drinking water standards, as updated in 2016. When both PFOS and PFOA are found in water, the combined concentrations of PFOS and PFOA should be compared to the 70-ng/L health advisory level.
[b] The groundwater and surface water project action limit for PFBS (400,000 ng/L) is the resident risk-based screening level for tap water from the June 2017 EPA regional screening level table.
[c] Achievable laboratory limits are updated on a regular basis and are subject to change.
CAS = Chemical Abstracts Service.
DL = Detection limit.
LOD = Limit of quantitation.
LOQ = Limit of detection.
N/A = Not available.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #15b – Reference Limits and Evaluation Table (PFOS/PFOA in Solids)

Laboratory	Analyte	CAS Number	Project Action Limit (µg/kg)	Achievable Laboratory Limits (µg/kg)[b]		
				DL	LOD	LOQ
ALS-Kelso	Perfluorooctanoic acid (PFOA)	335-67-1	1,260[a]	0.18	0.4	1.0
ALS-Kelso	Perfluorononanoic acid (PFNA)	375-95-1	N/A	0.18	0.4	1.0
ALS-Kelso	Perfluoroheptanoic acid (PFHpA)	375-85-9	N/A	0.22	0.6	1.0
ALS-Kelso	Perfluorobutanesulfonate (PFBS)	375-73-5	1,260,000[a]	0.17	0.4	1.0
ALS-Kelso	Perfluorohexane sulfonate (PFHxS)	355-46-4	N/A	0.17	0.4	1.0
ALS-Kelso	Perfluorooctane sulfonate (PFOS)	1763-23-1	1,260[a]	0.17	0.4	1.0
TestAmerica	Perfluorooctanoic acid (PFOA)	335-67-1	1,260[a]	0.102	0.300	0.500
TestAmerica	Perfluorononanoic acid (PFNA)	375-95-1	N/A	0.083	0.300	0.500
TestAmerica	Perfluoroheptanoic acid (PFHpA)	375-85-9	N/A	0.088	0.300	0.500
TestAmerica	Perfluorobutanesulfonate (PFBS)	375-73-5	1,260,000[a]	0.103	0.300	0.400
TestAmerica	Perfluorohexane sulfonate (PFHxS)	355-46-4	N/A	0.118	0.300	0.500
TestAmerica	Perfluorooctane sulfonate (PFOS)	1763-23-1	1,260[a]	0.126	0.300	0.500

[a] Project action limits for soils and sediment are the resident risk-based screening levels determined using the U.S. Environmental Protection Agency (EPA) regional screening level (RSL) calculator and the June 2017 EPA RSL table.
[b] Achievable laboratory limits are updated on a regular basis and are subject to change.
CAS = Chemical Abstracts Service.
DL = Detection limit.
LOD = Limit of quantitation.
LOQ = Limit of detection.
N/A = Not available.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #17 – Sampling Design and Rationale

The site inspections (SIs) will be conducted in general accordance with the U.S. Environmental Protection Agency's Triad Approach, incorporating data into the sampling approach and updating the conceptual site model as the SI proceeds. Potential perfluorooctane sulfonate/perfluorooctanoic acid (i.e., PFOS/PFOA) source areas were identified in the preliminary assessments. The specific planned approach and rationale for each of the Installation SIs are detailed in the Installation-specific SI Work Plans.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #18 – Sampling Locations and Methods (all media)

The sample locations and methods are included in the Installation-specific Site Inspection (SI) Work Plan (WP).

Sample identifiers for associated quality control samples are discussed in the SI WP.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheets #19 and #30 – Analytical Method Requirements Table and Sample Containers, Preservation, and Hold Times

Analyte	Matrix	Method	Container(s) (number, size, and type per sample)	Preservation	Sample Holding Time	Accreditation Number/Expiration Date
PFOS/PFOA	Water	EPA Method 537, revision 1.1 SOP LCP-PFCDOD	Two 60-mL HDPE containers with HDPE cap	Cool to 4°C ±2°; Trizma preservative for aqueous samples with residual chlorine	14 days to extraction 28 days to analysis	ALS-Kelso = 65188/ February 28, 2018
	Solids	EPA Method 537, revision 1.1 SOP LCP-PFCDOD	One 125-mL HDPE container with HDPE cap	Cool to 4°C ±2°	28 days to extraction 28 days to analysis	ALS-Kelso = 65188/ February 28, 2018
	Water	EPA Method 537, revision 1.1 SOP 537_Modified/WS-LC-0025	Two 250-mL HDPE containers with HDPE cap	Cool to 4°C ±2°; Trizma preservative for aqueous samples with residual chlorine	14 days to extraction 28 days to analysis	TestAmerica = L2468/ January 20, 2018
	Solids	EPA Method 537, revision 1.1 SOP 537_Modified/WS-LC-0025	One 4-oz. HDPE container with HDPE cap	Cool to 4°C ±2°	28 days to extraction 28 days to analysis	TestAmerica = L2468/ January 20, 2018

EPA = U.S. Environmental Protection Agency.
HDPE = High-density polyethylene.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
SOP = Standard Operating Procedure.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #20 – Field Quality Control Sample Summary Table

Field duplicate samples, field blanks, equipment rinsates, and field reagent blanks will be submitted to the analytical laboratory to provide a means to assess the quality of the data resulting from the field sampling program. Field blank samples will be analyzed to check for procedural contamination and ambient conditions at the site that may have caused sample contamination. Duplicate samples will be submitted to provide a quality assurance (QA) check on analytical procedures and results. The required quality control (QC) samples and associated frequencies are provided in the Installation-specific Site Inspection (SI) Work Plan.

Field Blanks. Field blanks are QA/QC samples intended to determine if any of the water used during the field investigation contains detectable concentrations of any analytes that may impact the quality of the samples. Field blanks are samples of the source of water used for decontamination. Field blanks will be analyzed for the same parameters as the original samples of interest by the fixed-base laboratory. If more than one source of water is used in the decontamination process, a sample of each (e.g., potable water and deionized water) should be analyzed. Assuming that water supplies remain constant, one set of field blank samples (i.e., one sample of potable water and one sample of deionized water) will be collected during the initial sampling event. If the source of potable water and/or deionized water supply is changed, an additional field blank sample will be collected for analysis at the first event in which the new water supply is used.

Field blanks will be assigned sample identifiers beginning with the letters 'FB' followed by two digits sequentially assigned (i.e., the first trip blank collected on the project will be given the sample identifier 'FB-01'; the second, 'FB-02'; etc.). The chain-of-custody (CoC) and field logbook will clearly identify the source of the water sampled (e.g., potable water source or deionized water).

Equipment Rinsates. Equipment rinsates are used as a measure of the effectiveness of the decontamination process. Equipment rinsates are samples of the final analyte-free water rinse from equipment cleaning and are submitted to the fixed-base laboratory for analysis. The equipment rinsates will be analyzed for the same analytes as the primary samples that are collected. Samples will be collected from reusable sampling equipment at a 10% frequency for fixed-base confirmation analysis of all samples collected with reusable equipment in compliance with the ANG Investigation Guidance (ANG 2009).

Equipment rinsates will be assigned sample identifiers beginning with the letters 'ER' followed by two digits sequentially assigned (i.e., the first equipment rinsate collected on the project will be given the sample identifier 'ER-01'; the second, 'ER-02'; etc.). The field logbook will clearly identify the sample(s) collected with the reusable equipment immediately prior and/or immediately following collection of the equipment rinsate sample, and the CoC will clearly identify the medium with which the equipment rinsate is associated (e.g., 'groundwater rinsate' when the equipment rinsate was collected from groundwater sampling equipment, or 'soil rinsate' when the equipment rinsate was collected from direct-push technology soil sampling equipment, etc.).

Field Reagent Blanks. The purpose of the field reagent blank is to determine if method analytes or other interferences are introduced throughout the entire shipping, sampling, and analyzing process. At the laboratory, the field reagent blank sample bottle will be filled with reagent water and preservatives, sealed, and shipped to the sampling site along with the sample bottles. For each field reagent blank shipped, an empty sample bottle (no preservatives) must also be shipped. At the sampling site, the sampler must open the shipped field reagent blank and pour the preserved reagent water into the empty shipped sample bottle, seal it, and then label this bottle as the field reagent blank. The field reagent blank

is shipped back to the laboratory along with the samples and analyzed to ensure that perfluorooctane sulfonate (i.e., PFOS) and perfluorooctanoic acid (i.e., PFOA) were not introduced into the sample during sample collection/handling. One field reagent blank will be collected and analyzed for each SI project. Because the groundwater samples are not coming from a municipal water source that involves water treatment and, therefore, no chlorination of the aqueous sample matrix, it may be determined that the field reagent blank is not required, except for purposes of determining potential impacts on the potable source used during the equipment decontamination process. In this case, the field reagent blank would only be applied to the potable source blank collected during sample collection and not the field samples during data validation.

Field Duplicates. Field duplicates are used to assess the precision of sampling techniques and provide checks on laboratory and field procedures. Field duplicates will be collected at a 10% frequency for fixed-base confirmation analysis of all samples in compliance with the ANG Investigation Guidance (ANG 2009).

MS/MSD Samples. Matrix spike (MS) and matrix spike duplicate (MSD) samples are, technically, laboratory QC samples, as they are samples from a specific medium that are spiked at the laboratory with known quantities of analytes. However, these samples are discussed within this field QC section as they require additional sample volumes to be collected in the field. MS and MSD samples are used to determine the accuracy and precision of the laboratory analyses as well as matrix interferences. Data from MS and MSD sample recoveries provide percentage recovery information so the laboratory can evaluate the accuracy and precision of its measurements. MS and MSD samples are equal portions of a single initial sample that have been spiked with specific analytes in known quantities; results of analyses must meet certain laboratory requirements to be acceptable. The total number of MS and MSD samples submitted to the fixed-base laboratory will be at a frequency of 1 set per (up to) 20 samples (e.g., 5% frequency) in compliance with the ANG Investigation Guidance (ANG 2009). If there is insufficient sample volume available for MS/MSD analyses, the laboratory should analyze laboratory control sample (LCS) duplicates in addition to the regular LCS analysis to ensure there is a precision measurement associated with the data.

Additional volumes sent for MS and MSD analyses will be submitted under the same sample identifier as the primary sample with a notation on the CoC that additional volumes were submitted for MS and MSD analyses.

QAPP Worksheet #21 – Field SOPs Reference Table

The following list of Leidos Energy, Environmental Science and Engineering Field Technical Procedures includes all Standard Operating Procedures (SOPs) that may apply during field activities. A copy of each SOP is provided on the Leidos internal Quality Assurance website, accessible to Leidos employees. Leidos' referenced SOPs can be made available to any stakeholder upon request.

QAPP Worksheet #23 – Analytical Laboratory SOP References Table

The Laboratory Standard Operating Procedures for U.S. Environmental Protection Agency modified Method 537, revision 1.1 analyses of aqueous and solid matrices are proprietary, but may be available upon request if appropriate written permissions are obtained. The laboratory must meet the requirements of the U.S. Department of Defense (DoD) Quality Systems Manual (QSM), version 5.1, Table B-15 for the analysis of per- and polyfluorinated substances compounds, even if the laboratory's current scope of accreditation is for DoD QSM, version 5.0.

Laboratory SOP Number	Title, Revision Date, and/or Number	Definitive or Screening Data	Matrix and Analytical Group	Instrument	Organization Performing Analysis	Modified for Project Work? (Y/N)
LCP-PFCD0D	Perfluoroalkyl Substances by High Performance Liquid Chromatography/Tandem Mass Spectrometry for DoD Projects: Revision 0; 06/02/17	Definitive	Water/Soil	LC/MS/MS	ALS-Kelso	N
WS-LC-0025	Per- and Polyfluorinated Substances in Water, Soils, Sediments and Tissue; Revision 2.7; 09/20/17	Definitive	Water/Soil	LC/MS/MS	TestAmerica-Sacramento	N

Note: Laboratories SOPs are continuously reviewed and updated; therefore, the revision number and date associated with any laboratory SOP are subject to change.
DoD = U.S. Department of Defense.
LC/MS/MS = Liquid chromatography/tandem mass spectrometry.
SOP = Standard Operating Procedure.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #24 – Analytical Instrument Calibration Table

Instrument	Calibration Procedure	Frequency of Calibration	Acceptance Criteria	Corrective Action	Person Responsible for Corrective Action	SOP Reference
LC/MS/MS	ICAL	At instrument set-up and after ICV or CCV failure, prior to sample analysis	The isotopically labeled analog of an analyte (extracted internal standard analyte) must be used for quantitation if commercially available (isotope dilution quantitation) If a labeled analog is not commercially available, the extracted internal standard analyte with the closest retention time to the analyte must be used for quantitation (internal standard quantitation) S/N Ratio: ≥10:1 for all ions used for quantification For analytes having a promulgated standard, (e.g., health advisory levels for PFOS and PFOA), the qualitative (confirmation) transition ion must have an S/N ratio of ≥3:1 The percent relative standard deviation of the response factors for all analytes must be <20%. Linear or nonlinear calibrations must have r2 ≥0.99 for each analyte. Analytes must be within 70 to 130% of their true value for each calibration standard	Correct problem, then repeat ICAL	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)
	ICAL, CCV, and spiking standards	All analytes	Standards containing both branched and linear isomers must be used when commercially available If not available, the total response of the analyte must be integrated (i.e., accounting for peaks that are identified as linear and branched isomers) and quantitated using a calibration curve that includes the linear isomer only for that analyte (e.g., PFOA)	N/A Standards containing both branched and linear isomers are to be used during method validation to ensure the total response is quantitated for that analyte	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)
	ISC	Prior to analysis and at least every 12 hr	Analyte concentrations must be at LOQ; concentrations must be within ±30% of their true values	Correct problem, rerun ISC. If problem persists, repeat ICAL	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)

QAPP Worksheet #24 – Analytical Instrument Calibration Table (continued)

Instrument	Calibration Procedure	Frequency of Calibration	Acceptance Criteria	Corrective Action	Person Responsible for Corrective Action	SOP Reference
	ICV	Once after each ICAL, analysis of a second source standard prior to sample analysis	±30% of the true value	Correct problem, rerun ICV. If problem persists, repeat ICAL	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)
	CCV	Prior to analysis, after every 10 field samples, and at the end of the analytical sequence	Concentration of analytes must range from the LOQ to the mid-level calibration concentration ±30% of the true value	Immediately analyze two additional consecutive CCVs. If both pass, samples may be reported without reanalysis. If either fails, or if two consecutive CCVs cannot be run, perform corrective action(s) and repeat CCV and all associated samples since last successful CCV Alternately, recalibrate if necessary; then reanalyze all associated samples since the last acceptable CCV	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)
	Tune	Prior to ICAL and after any mass calibration or maintenance is performed	Instrument manufacturer's instructions	Retune instrument. If the tuning will not meet acceptance criteria, an instrument mass calibration must be performed and the tuning redone	Laboratory analyst	DoD QSM, version 5.1, Table B-15 Laboratory SOP LCP-PFCDOD (ALS-Kelso) Laboratory SOP WS-LC-0025 (TestAmerica)

CCV = Continuing calibration verification.
DoD = U.S. Department of Defense.
ICAL = Initial calibration.
ICV = Initial calibration verification.
ISC = Initial sensitivity check.
LC/MS/MS = Liquid chromatography/tandem mass spectrometry.
LOQ = Limit of quantitation.
N/A = Not applicable.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
QSM = Quality Systems Manual.
S/N = Signal to noise.
SOP = Standard Operating Procedure.

QAPP Worksheet #25 – Analytical Instrument and Equipment Maintenance, Testing, and Inspection Table

Instrument/Equipment	Maintenance Activity	Testing Activity	Inspection Activity	Frequency	Acceptance Criteria	Corrective Action	Responsible Person	SOP Reference
LC/MS/MS (ALS-Kelso)	Per vendor's instructions	Per vendor's instructions	Per vendor's instructions	As needed	Mass calibrations, tune checks, ICAL, and CCVs pass method specifications	Perform additional maintenance prior to instrument calibration or calibration verification	Laboratory analyst and/or through vendor contact	LCP-PFCDOD
LC/MS/MS (TestAmerica)	Replace columns as needed, check eluent reservoirs	Sensitivity check	Instrument performance and sensitivity	Daily or as needed	CCV pass criteria	Recalibrate	TestAmerica chemist	WS-LC-0025

CCV = Continuing calibration verification.
ICAL = Initial calibration.
LC/MS/MS = Liquid chromatography/tandem mass spectrometry.
SOP = Standard Operating Procedure.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #28 – Analytical Laboratory Quality Control Sample Table (PFOS/PFOA in Waters and Soils)

Matrix: Water and soil					
Analytical Group: PFOS/PFOA					
Concentration Level: All					
Analytical Method/SOP Reference: EPA Method 537, revision 1.1; DoD QSM, version 5.1, Table B-15					
Analytical Organization: ALS-Kelso, TestAmerica-Sacramento					
QC Sample	**Frequency/Number**	**QC Acceptance Limits**	**Corrective Action**	**Person(s) Responsible for Corrective Action**	**Measurement Performance Criteria**
ISC	Prior to analysis and at least once every 12 hr	Analyte concentrations at LOQ must be within ±30% of true value	Correct problem, rerun ISC. If problem persists, repeat ICAL	Laboratory analyst	See Worksheet #12
Instrument Blank	Immediately following the highest standard analyzed and daily prior to sample analysis	No analytes detected >1/2 LOQ	If acceptance criteria are not met after the highest calibration standard, calibration must be performed using a lower concentration for the highest standard and/or additional instruments blanks must be analyzed until acceptance criteria are met. Additional samples shall not be analyzed until acceptance criteria are met	Laboratory analyst	See Worksheet #12
Extraction Internal Standards	Every field sample, standard, blank, and QC sample	50 to 150% of true value	Reprepare and reanalyze as needed. Greater dilution may be required. If reanalysis confirms failures, narrate and qualify associated data	Laboratory analyst	See Worksheet #12
Injection Internal Standards	Every field sample, standard, blank, and QC sample	-50 to +50% of peak area of ICAL midpoint or CCV	Reanalyze. If reanalysis fails, either analysis may be reported with the appropriate flags	Laboratory analyst	See Worksheet #12

QAPP Worksheet #28 – Analytical Laboratory Quality Control Sample Table (PFOS/PFOA in Waters and Soils) (continued)

Matrix: Water and soil					
Analytical Group: PFOS/PFOA					
Concentration Level: All					
Analytical Method/SOP Reference: EPA Method 537, revision 1.1; DoD QSM, version 5.1, Table B-15					
Analytical Organization: ALS-Kelso, TestAmerica-Sacramento					
QC Sample	**Frequency/Number**	**QC Acceptance Limits**	**Corrective Action**	**Person(s) Responsible for Corrective Action**	**Measurement Performance Criteria**
Surrogate Spike	Per sample (including MS/MSD, LCS, and blanks)	70 to 130%	Re-extract sample. If the surrogate compound fails high, and there are no positive detections, the sample can be reported Note: Surrogates are not a DoD QSM, version 5.1 requirement because the isotope dilution method uses the extraction internal standard for analyte quantitation. The use of surrogates will be optional, depending on the laboratory method requirements	Laboratory analyst	See Worksheet #12
Method Blank	1 per 20 field samples	No analytes detected >1/2 LOQ or >1/10 the amount measured in any sample or 1/10 the regulatory limits, whichever is greater	Re-extract to confirm detection, or report if the analyte present in the method blank is not detected in the sample	Laboratory analyst	See Worksheet #12
LCS	1 per 20 field samples	Laboratory analyte recovery in-house limits; RPD ≤30%	Re-extract LCS and associated samples. Analytes that fail high and are non-detect in the samples can be reported	Laboratory analyst	See Worksheet #12

QAPP Worksheet #28 – Analytical Laboratory Quality Control Sample Table (PFOS/PFOA in Waters and Soils) (continued)

Matrix: Water and soil					
Analytical Group: PFOS/PFOA					
Concentration Level: All					
Analytical Method/SOP Reference: EPA Method 537, revision 1.1; DoD QSM, version 5.1, Table B-15					
Analytical Organization: ALS-Kelso, TestAmerica-Sacramento					
QC Sample	**Frequency/Number**	**QC Acceptance Limits**	**Corrective Action**	**Person(s) Responsible for Corrective Action**	**Measurement Performance Criteria**
MS/MSD	1 per 20 samples	Laboratory LCS analyte recovery in-house limits; RPD ≤30%	Evaluation in conjunction with LCS results	Laboratory analyst	See Worksheet #12
Post-Spike Sample	Only applies to results <LOQ in aqueous samples prepared by serial dilution method. Spiking must occur at the LOQ	70 – 130% recovery	Reanalyze at higher dilutions until criterion is met	Laboratory analyst	See Worksheet #12

CCV = Continuing calibration verification.
DoD = U.S. Department of Defense.
EPA = U.S. Environmental Protection Agency.
ICAL = Initial calibration.
ISC = Instrument sensitivity check.
LCS = Laboratory control sample.
LOQ = Limit of quantitation.
MS = Matrix spike.
MSD = Matrix spike duplicate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
QC = Quality control.
QSM = Quality Systems Manual.
RPD = Relative percent difference.
SOP = Standard Operating Procedure.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #29 – Project Documents and Records Table

Note: All referenced Leidos Environmental Science and Engineering (ESE) procedures are available on the Leidos internal Quality Assurance (QA) website, accessible to Leidos employees. Leidos' referenced procedures can be made available to any stakeholder upon request.

A. Project Records

Per ESE Procedure A17.1, project records will be kept by the Leidos Project Manager (PM) to document QA/quality control (QC) activities and provide support for possible evidential proceedings. Project files include:

1) Communications:
   a) Internal, and
   b) External.

2) QA/QC:
   a) Procedures,
   b) Field project planning and Readiness Review,
   c) Chain-of-custody (CoC),
   d) Audit reports,
   e) Field Change Request forms,
   f) Nonconformance/Corrective Action Reports,
   g) Data quality acceptance, and
   h) Document Review Records.

3) Technical information:
   a) Analytical data,
   b) Field data,
   c) Site logbook,
   d) Field sampling logbooks,
   e) Field data record forms,
   f) Graphic resources,
   g) Calculations/evaluations, and
   h) Regulatory compliance.

4) Project management:
   a) Project schedule,
   b) Budget, and
   c) Site database information.

5) Health and safety:
   a) Plans/procedures,
   b) Audits reports documents,
   c) Plans,
   d) Reports, and
   e) Relevant publications.

Copies of all records will be maintained by Leidos for the length of the project. The Leidos PM will ensure that records are properly stored and retrievable.

A.1 Laboratory Submittals

The laboratory will confirm sample receipt and log-in information through return of a copy of the completed CoC and laboratory Cooler Receipt Checklist and confirmation of the laboratory's analytical log-in (Letter of Receipt) to Leidos within 2 days of sample receipt.

The laboratory will provide definitive analytical deliverables within a routine analytical service turnaround of 21 calendar days for complete data packages. Electronic data deliverables (EDDs) will be provided within 10 business days as standard practice, with rapid turn a possibility for select samples. 'Definitive Deliverables' will be provided in data packages consistent with requirements listed in the U.S. Department of Defense Quality Systems Manual, version 5.1 (DoD 2017) and applicable portions of U.S. Environmental Protection Agency Method 537, revision 1.1 (EPA 2009), including initial and continuing calibration records and raw data. Uniform Federal Policy Quality Assurance Project Plan Worksheets #12, #24, and #28 include required components of the analytical data package. EDDs will include information identified by and a format consistent with that required by the most recent version of the Environmental Resources Program Information Management System (ERPIMS). In all, the laboratory will provide:

- Full data packages (including raw data) in portable document file (PDF) format.
- ERPIMS EDD files.
- An Excel spreadsheet with sample results. The laboratory may use their basic EDD format, which should include, at a minimum, sample identifiers, analytical method, dilution factor, analyte, results, units, result qualifier, detection limit, limit of detection, limit of quantitation, dilution factor, and sample type (reanalysis, dilution, etc.).

A.2 Leidos Field Documentation

Field documentation from logbooks, data collection sheets, digital photography, correspondence, and CoC forms will comprise the bulk of the field documentation associated with the SI. The procedures for field documentation will be performed in accordance with ESE Field Technical Procedure-1215. Digital data will be accumulated and maintained on the Leidos project directory and electronic record retention system tape backup in accordance with ESE Procedure Data Management-03. All data will be stored until project activities are complete. Thereafter, all data will be maintained for 7 years in accordance with Leidos ESE QA Program Standard Operating Procedure ESE A17.1, Revision 1.

A.3 Internal Document Review

Leidos' process for document review (ESE A3.1) includes the assignment of an Independent Technical Review (ITR) lead. The ITR lead will work with the PM to ensure ITRs of all deliverables are completed. The ITR-assigned personnel will focus on identifying and correcting deficiencies relating to technical issues; compliance with the Statement of Objectives (NGB 2017); and compliance with relevant specifications, laws, and regulations. In addition, ITR-assigned personnel will ensure the clarity of the document and use of proper punctuation, syntax, and grammar. Verification that deficiencies have been addressed properly will be conducted by the ITR lead following revisions.

B. Reports and Other Project Deliverables

Final deliverable submittals to the Air National Guard (ANG) will include native files and the final document PDF (in parts, if necessary) for inclusion in the online Administrative Record, in accordance with Policy A7O 15-01, *Policy for Delivery of Final Electronic Deliverables* (ANG 2015).

B.1 Site Inspection Reports

A Site Inspection (SI) Report for each Installation will be prepared in draft, draft final, and final versions. Each draft report will be provided to ANG, the Installation Environmental Manager, and the surveillance and oversight contractor for review and comment. Following appropriate revisions based on ANG review, the draft final report will be submitted for regulatory review and comment. The final report will be distributed to stakeholders following appropriate revisions.

B.2 Monitoring Well Inventory

Leidos will inspect each well installed or sampled for perfluorooctane sulfonate/perfluorooctanoic acid (i.e., PFOS/PFOA) and report any changes prior to the end of the period of performance, in accordance with Policy A7O 11-01, *Collection of Digital Spatial Data for Monitoring Wells During Environmental Investigation at Air National Guard Sites*, and Policy A7O 14-01 (ANG 2011), *Requirements for Geospatial Data Deliverables* (ANG 2014).

B.3 Environmental Resources Program Information Management System

Leidos will ensure that the laboratory provides appropriate data for inclusion in ERPIMS and will electronically submit the required deliverable within 70 days of sampling, in accordance with Policy A7O 10-01, *Environmental Resources Program Information Management System (ERPIMS)* (ANG 2010). Additional time may be required to resolve any comments received by the ERPIMS Help Desk. If the goal of 70 days will not be met for any reason, Leidos will inform the ANG Program Manager and provide the rationale for delay as required by the guidance.

C. Geographic Information System Data Deliverable

A comprehensive geospatial data deliverable for the project will be prepared in accordance with Policy A7O 14-01 (ANG 2014). The geospatial data deliverable will initially be submitted to the ANG Program Manager in conjunction with the Draft SI Report prepared under this task order. The ANG Program Manager will transmit the draft deliverable to the GeoBase office for review and acceptance. If required, a revised (final) submittal will be prepared by Leidos in conjunction with the Final SI Report. This revised (final) submittal will incorporate any revisions due to review comments from the GeoBase team and/or any revisions to the SI Report affecting the geospatial data.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheets #31, #32, and #33 – Assessments and Corrective Action Responses

Assessment Response and Corrective Action

Assessment Type	Individual(s) Notified of Findings (name, title, organization)	Timeframe of Notification	Nature of Corrective Action Response Documentation	Individual(s) Receiving Corrective Action Response (name, title, organization)	Timeframe for Response
Analytical DQA	Leidos PM Laboratory PM	Nonconformance Reports and Corrective Action Reports should be issued immediately if required. DQA Report should be issued as soon as all data validation is completed for a particular phase of the project	Nonconformance Report (if required) Corrective Action Report (if required)	Leidos Corporate QA Manager/ Project QA Officer	2 weeks
Field Surveillance	Leidos PM	Immediately	Nonconformance Report (if required) Corrective Action Report (if required)	Leidos Corporate QA Officer	2 weeks

DQA = Data quality assessment.
PM = Project Manager.
QA = Quality control.

QAPP Worksheets #31, #32, and #33 – Assessments and Corrective Action Responses (continued)

Assessments

Type of Report	Frequency	Project Delivery Date(s)	Person(s) Responsible for Report Preparation	Report Recipient(s)
Data Validation Report	Per sample delivery group	Within 3 weeks after receipt of Level IV data package	Leidos Project Chemist, Leidos Project QA Officer	Leidos PM
DQA	With each phase of the project	Issued as soon as all data validation is completed for a particular phase of the project	Leidos Project Chemist, Leidos Project QA Officer	Leidos PM
Major Analysis Problem Identification (internal memorandum)	When persistent analysis problems are detected	Immediately	Leidos Project Chemist, Leidos Project QA Officer	Leidos PM
MPR	Monthly for duration of the project	Monthly	Leidos PM	NGB/A4OR Program Manager
Laboratory QA Report	When significant plan deviations result from unanticipated circumstances	Immediately	Laboratory PM	Leidos Project Chemist, Leidos Project QA Officer, and Leidos QA Manager, if needed

DQA = Data quality assessment.
MPR = Monthly Progress Report.
NGB/A4OR = National Guard Bureau Operations Division Restoration Branch.
PM = Project Manager.
QA = Quality assurance.

QAPP Worksheet #34 – Data Verification and Validation Inputs

Item	Description	Verification (completeness)	Validation (conformance to specifications in the UFP-QAPP)
	Analytical Data Package		
1	Cover sheet (laboratory identifying information)	X	X
2	Case narrative and definition of qualifiers	X	X
3	Sample receipt records	X	X
4	Field sample and field QC sample results (Form Is)	X	X
5	Blanks summaries	X	X
6	MS/MSD summaries	X	X
7	LCS summaries	X	X
8	Surrogate recovery summaries (if required)	X	X
9	Internal standard recovery summaries	X	X
10	Initial and continuing calibration summaries	X	X
11	All other information as defined in Worksheets #12, #24, and #28	X	X
12	Analytical raw data for all data (i.e., calibrations, QC, and samples)	X	NA[a]
13	Required laboratory signatures	X	X
14	Nonconformance Reports/Corrective Action Reports (if applicable)	X	X
	Field Records		
15	Field logbooks	X	X
16	Equipment calibration records	X	X
17	CoC Forms	X	X
18	Drilling logs	X	X
19	Field change requests (if required)	X	X
20	Field corrective action reports (if required)	X	X

[a] Data packages will be verified to ensure that raw data are included, however; because no calculations will be performed as part of the validation process, raw data are not a component of data validation.
Note: Verification and validation only apply to perfluorooctane sulfonate and perfluorooctanoic acid because they are the critical chemicals of concern of the six compounds identified in the third Unregulated Contaminant Monitoring Rule (UCMR3) (EPA 2012). The other four compounds identified in UCMR3 (EPA 2012) are included for informational purposes only.
CoC = Chain-of-custody.
LCS = Laboratory control sample.
MS = Matrix spike.
MSD = Matrix spike duplicate.
NA = Not applicable.
QC = Quality control.
UFP-QAPP = Uniform Federal Policy Quality Assurance Project Plan.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #35 – Data Verification Procedures

Records Reviewed	Requirement Document	Process Description	Responsible Person, Organization
Field Logbook	UFP-QAPP and Leidos ESE FTP-1215 SOP	Verify that records are present and complete for each day of field activities. Verify that all planned samples, including field QC samples, were collected and that sample collection locations are documented. Verify that meteorological data were provided for each day of field activities. Verify that changes/exceptions are documented and were reported in accordance with requirements. Verify that any required field monitoring was performed and results are documented	Project Field Manager PM Project QA Officer
Sample Receipt and CoC	UFP-QAPP, Leidos ESE FTP-625 SOP, and laboratory SOPs	The condition of shipping coolers and enclosed sample containers will be documented upon receipt at the analytical laboratory. This documentation will be accomplished using a cooler receipt checklist. A Sample Receipt Confirmation Report will be transmitted to Leidos within 48 hr of sample receipt. The original completed checklist will be transmitted with the final data package	Documentation of sample receipt and generation of sample receipt checklist – Laboratory PM Review of Sample Receipt Confirmation Report to ensure samples were logged in correctly – Leidos Project Chemist
Laboratory Data Package	UFP-QAPP, laboratory SOPs, and Leidos ESE Procedure Data Management-05	Verify data package for completeness, as defined in the UFP-QAPP, for the following: • cover sheet with identifying information; • case narrative; • sample receipt information and CoC; • sample results; • blanks summaries; • MS/MSD summaries; • internal standard summaries; • LCS summaries; • surrogate recovery summaries (if required); • initial and continuing calibration summaries; • All other requirements specified in Worksheets #12, #24, and #28; • analytical raw data; and • required laboratory signatures	**Before release from laboratory –** Laboratory PM or QA Officer **Upon receipt –** Leidos Project Chemist

QAPP Worksheet #35 – Data Verification Procedures (continued)

Records Reviewed	Requirement Document	Process Description	Responsible Person, Organization
Nonconformance Reports/Corrective Action Reports (if applicable)	UFP-QAPP, laboratory SOPs, and the appropriate SW-846 method(s)	Verify that corrective action was implemented according to plan	Leidos Project Chemist, Leidos Project QA Officer, and Leidos Corporate QA Manager

Note: All referenced Leidos ESE procedures are available on the Leidos internal QA website, accessible to Leidos employees. Leidos' referenced procedures can be made available to any stakeholder upon request.
Note: The data verification process will include verification that all six compounds identified in the third Unregulated Contaminant Monitoring Rule (EPA 2012) are reported; however, data review against QA/QC acceptance criteria will be limited to perfluorooctane sulfonate and perfluorooctanoic acid because they are the critical chemicals of concern.
CoC = Chain-of-custody.
ESE = Environmental Science and Engineering.
FTP = Field Technical Procedure.
LCS = Laboratory control sample.
MS = Matrix spike.
MSD = Matrix spike duplicate.
QA = Quality assurance.
QC = Quality control.
PM = Project Manager.
SOP = Standard Operating Procedure.
UFP-QAPP = Uniform Federal Policy Quality Assurance Project Plan.

QAPP Worksheet #36 – Data Validation Procedures

Data Validator	Leidos
Analytical Group/Method	PFOS/PFOA by laboratory SOP; EPA Method 537, revision 1.1; and DoD QSM, version 5.1 requirements
Data Deliverable Requirements	ERPIMS EDD files Excel spreadsheet with sample results. The laboratory may use their basic EDD format, which should include, at a minimum, sample identifiers, analytical method, dilution factor, analyte, results, units, result qualifier, DL, LOD, LOQ, dilution factor, and sample type (reanalysis, dilution, etc.) Level IV data package on compact disc (includes all QA/QC and calibration summaries as well as raw data)
Analytical Specifications/Measurement Performance Criteria	QAPP Worksheets #12, #15, #24, and #28; Laboratory's SOPs
Measurement Performance Criteria	Worksheets #12, #24, and #28 and DoD QSM, version 5.1
Percent of Data Packages to be Validated	100% for PFOS and PFOA
Percent of Raw Data Reviewed	None
Percent of Results to be Recalculated	None
Validation Procedure	The Leidos Project Chemist will validate analytical data packages using Leidos procedure ESE Data Management-05[a]. These packages are generated by a subcontracted commercial laboratory. Leidos will evaluate the laboratory performance using objective criteria taken from the requirements of the project UFP-QAPP; the DoD QSM, version 5.1; and EPA functional guidelines. This process is done independently from the end data users that prepare the SI Reports. The findings of this evaluation are summarized in the DQA. All data validation and DQA documentation will receive a technical review by the project QA Officer

[a] Initial and continuing calibration verification and validation will be limited to 10% of the PFOS and PFOA calibration results, as specified in the *Air National Guard Environmental Restoration Program Investigation Guidance* (ANG 2009). All other verification and validation will require 100% review of other QA/QC data as they apply to PFOS and PFOA.

Note: Non-compliant data will be qualified as follows:

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit. These results are qualitatively acceptable.

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample. These results are qualitatively acceptable but estimates.

UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is an estimate.

R = The analyte was rejected due to QC parameters that far exceed QC requirements, as described in Leidos SOP ESE Data Management-05.

DL = Detection limit.
DoD = U.S. Department of Defense.
DQA = Data quality assessment.
EDD = Electronic data deliverable.
EPA = U.S. Environmental Protection Agency.
ERPIMS = Environmental Resources Program Information Management System.
ESE = Environmental Science and Engineering.
LOD = Limit of detection.
LOQ = Limit of quantitation.
QA = Quality assurance.
QC = Quality control.
QSM = Quality Systems Manual.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
SI = Site inspection.
SOP = Standard Operating Procedure.
UFP-QAPP = Uniform Federal Policy Quality Assurance Project Plan.

THIS PAGE INTENTIONALLY LEFT BLANK.

QAPP Worksheet #37 – Data Usability Assessment

Review the Project Objectives and Sampling Design: The data usability assessment will be performed by a team of Leidos personnel. The Leidos Project Chemist and Project QA Officer will be responsible for information in the data usability assessment. Note that the data usability assessment will be conducted on verified/validated PFOS/PFOA data. After the data usability assessment has been performed, data deemed appropriate for use then will be used to support further recommendations. The results of the data usability assessment will be presented in the final DQA
Data Verification/Validation Outputs: Precision—Results of all laboratory duplicates, MS/MSD pairs, LCS/LCSD pairs, and field duplicates will be assessed against measurement performance criteria provided on Worksheet #12. The RPDs exceeding criteria will be identified in the DQA. A discussion will follow summarizing the results of the laboratory precision. Any conclusions about the precision of the analyses will be drawn, and any limitations on the use of the data will be described. Accuracy/Bias Contamination—Results for all laboratory method blanks and field QC blanks will be assessed against measurement performance criteria provided on Worksheet #12. Results for analytes that exceed criteria will be identified in the DQA. Any conclusions about the accuracy/bias of the analyses based on contamination will be drawn, and any limitations on the use of the data will be described in the DQA. Overall Accuracy/Bias—The results for the LCS/LCSDs, MS/MSDs, internal standards, and surrogates (if required) will be assessed against measurement performance criteria provided on Worksheet #12. In addition, initial and continuing calibration data will be compared to the requirements provided on Worksheet #24. A discussion will follow summarizing overall accuracy/bias. Any conclusions about the overall accuracy/bias of the analyses will be drawn, and any limitations on the use of the data will be described in the DQA. Sensitivity—Results for all samples will be presented separately in tabular format for each analysis. The results for each analyte will be checked against the laboratory DLs, LODs, LOQs, and project action levels. A discussion will follow summarizing the results of the laboratory sensitivity. Any conclusions about the sensitivity of the analyses will be drawn, and any limitations on the use of the data will be described in the DQA. Representativeness—Representativeness will be achieved by using standard sampling and analytical methodologies governing sample collection methods, sample size, preservation and handling, and methodology. Representativeness will be assessed qualitatively by ensuring that sample collection, handling, and analysis methodologies were followed. A discussion will follow summarizing the results of the representativeness of the results. Any conclusions about the representativeness of the analyses will be drawn, and any limitations on the use of the data will be discussed in the DQA. Comparability—Comparability will be achieved by using standard sampling and analysis procedures that can be reproduced in future sampling events. Analytical results also will be compared semi-qualitatively to historical data available for the site and field observations. A discussion will follow summarizing the results of the comparability of the results. Any conclusions about the comparability of the analyses will be drawn, and any limitations on the use of the data will be described in the DQA. Completeness—A completeness check will be done on all of the data generated by the laboratory. Completeness criteria are presented in Worksheet #12. Completeness will be calculated as the number of data points that are not rejected in the data verification and validation process divided by the total number of data points planned. Any conclusions about the completeness of the data for each analyte will be drawn, and any limitations on the use of the data will be described in the DQA. Reconciliation—Each of the project quality objectives presented on Worksheet #11 will be examined to determine if the objective was met. This examination will include a combined overall assessment of the results of each analysis pertinent to an objective. Each analysis will first be evaluated separately in terms of the major impacts observed from the data validation, data quality indicators, and measurement performance criteria assessments. Based on the results of these assessments, the quality of the data will be determined. Based on the quality determined, the usability of the data for each analysis will be determined. Based on the combined usability of the data from all analyses for an objective, it will be determined if the project quality objective was met and whether project action limits were exceeded. The final report will include a summary of all the points that went into the reconciliation of each objective. As part of the reconciliation of each objective, conclusions will be drawn, and any limitations on the usability of any of the data will be described.

QAPP Worksheet #37 – Data Usability Assessment (continued)

Identify the personnel responsible for performing the usability assessment: Brooke Francis or Joe Peters, Project Chemist, Leidos
Describe how the usability assessment will be documented: An analytical DQA report will be generated and will discuss limitations of data usability

Note: Data usability assessment inputs and outputs and data usability discussions will be limited to PFOS and PFOA.
DL = Detection limit.
DQA = Data quality assessment.
LCS = Laboratory control sample.
LCSD = Laboratory control sample duplicate.
LOD = Limit of detection.
LOQ = Limit of quantitation.
MS = Matrix spike.
MSD = Matrix spike duplicate.
PFOA = Perfluorooctanoic acid.
PFOS = Perfluorooctane sulfonate.
QA = Quality assurance.
QC = Quality control.
RPD = Relative percent difference.

Three distinct evaluative steps will be used to ensure project data quality needs are met: verification, validation, and usability assessment. These steps apply to all aspects of field sampling and analytical activities as they apply to perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA).

A. Laboratory Data Verification

The laboratory will perform in-house analytical data reduction under the direction of the Laboratory Quality Assurance (QA) Manager. The Laboratory QA Manager or designee is responsible for assessing data quality and informing Leidos and the Air National Guard of any data that are considered unacceptable or require caution on the part of the data user in terms of their reliability. Data will be reduced, evaluated, and reported as described in the laboratory QA plan. Data reduction, review, and reporting by the laboratory will be conducted as follows:

- Raw data are produced by the analyst who has primary responsibility for the correctness and completeness of the data. All data will be generated and reduced following the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP)-defined methods and implementing laboratory Standard Operating Procedure.

- Level 1 technical data review is completed relative to an established set of guidelines by a peer analyst. The review will ensure the completeness and correctness of the data while ensuring all method quality control (QC) measures have been implemented and were within appropriate criteria.

- Level 2 technical review is completed by the area supervisor or data review specialist. This specialist reviews the data for attainment of QC criteria, as outlined in the established methods, and for overall reasonableness. The review will ensure that all calibration and QC data are in compliance. The review will document that the data package is complete and ready for reporting and archiving.

- Upon acceptance of the raw data by the area supervisor, the report is generated and sent to the Laboratory Project Manager (PM) or designee for Level 3 administrative data review. The review will ensure consistency and compliance with all laboratory instructions, the laboratory QA plan, the project laboratory statement of work, and the UFP-QAPP.

- The Laboratory PM will complete a thorough review of all reports.

- Final reports will be generated and signed by the Laboratory PM or designee.

- Data then will be delivered to the Leidos Project Chemist via the Leidos Data Manager for data verification and validation.

The data review process will include identification of any out-of-control data points and data omissions, as well as interactions with the laboratory to correct data deficiencies. Decisions to repeat sample collection and analyses may be made by the Leidos PM based on the extent of the deficiencies and their importance in the overall context of the project. The laboratory will provide flagged data to include such items as: (1) concentration below the required detection limit, (2) estimated concentration due to poor spike recovery, and (3) concentration of chemical also found in the laboratory blank.

The laboratory will prepare and retain full analytical and QC documentation for the project for a minimum of 7 years. Such retained documentation may be hard (paper) copy and/or electronic storage media (e.g., compact disc or digital versatile disc) as dictated by the analytical methodologies employed. As needed, the laboratory will supply hard copies of the retained information.

B. Leidos Data Verification and Validation

The Leidos Project QA Officer or designee will initiate a verification of the analytical data packages, as described below. One hundred percent of the data (environmental media, field QC blanks, and associated laboratory QC analyzed for target PFOS and PFOA) will be verified using acceptance criteria provided on Worksheet #12 and in accordance with Environmental Science and Engineering (ESE) Procedure Data Management-05.

An independent review of the data set will be performed by the Leidos Data Validator and/or QA Specialist. In addition, the PM will conduct an evaluation during preparation of reports to ensure that the precision and accuracy of the analytical data are adequate for their intended use. The greatest uncertainty in a measurement is often a result of the sampling process and inherent variability in the environmental media rather than the analytical measurement. Therefore, analytical data evaluation will be performed to the level necessary to ascertain data usability (e.g., identifying estimated or rejected data) and to minimize the potential of using false-positive or false-negative results in the decision-making process (i.e., to ensure accurate identification of detected versus non-detected compounds). This approach is consistent with the data quality objectives (DQOs) for the project, with the analytical methods, and for evaluation of potential remedial designs and contaminant degradation.

Data evaluation will be accomplished by comparing the contents of the data packages and QA/QC results to requirements contained in the requested analytical methods. Leidos will evaluate QC data reported by the laboratory against required precision and accuracy limits established in the U.S. Department of Defense Quality Systems Manual, version 5.1 (DoD 2017) and other QC criteria presented in this UFP-QAPP. All QA/QC parameters summarized in each sample delivery group (SDG) will be evaluated against criteria presented in Worksheet #12 by data verification and validation personnel. This review process will not include calculations from the analytical raw data, unless trends in extreme outliers that result in data rejection are noted. If it is deemed that calculations from the raw data are needed, calculations will only be performed to the level necessary to ascertain that the laboratory is accurately reporting results related to the outliers that result in rejection. If it is found that the laboratory is not accurately reporting results related to the issue that initiated calculations from the raw data, a Nonconformance Report or Corrective Action Report will be initiated as necessary to ensure that project DQOs are not compromised.

Leidos data verification and validation support staff will conduct a systematic review of the chemical of concern data set for compliance with the established QC criteria based on the following categories:

- Sample condition upon receipt,
- Holding times,
- Blanks,
- Matrix spike/matrix spike duplicates,
- Laboratory control samples,
- Surrogate recovery (organic methods),
- Internal standards,
- Calibration (10% of calibration information will be verified/validated),

- Sample reanalysis,
- Secondary dilutions, and
- Laboratory case narrative.

Data qualifications will be applied based on deviations from the measurement performance criteria identified on Worksheet #12. Information gathered during this verification process will be consistent with the information demonstrated by Leidos verification/validation checklists.

A data validation checklist will be prepared for each analytical SDG received from the laboratory. This data validation checklist includes the sample Form 1s for the SDG evaluated, and resulting data validation qualifiers and reason codes associated with the data validation qualifier are annotated on the Form I. Each validation checklist includes a section for each QA/QC procedure required for each analytical method, and any QA/QC outliers and the impact of the outlier on data quality are noted in these sections. Each data validation checklist will be archived and used to determine overall data usability at the end of each phase of the project. These checklists will be included in the final report as an appendix.

C. Usability Assessment

The usability assessment considers whether the collected data meet the project DQOs. The usability assessment is the final step of data review and will be performed only on verified and validated data. The DQO process for this project is presented throughout this document, but principally on Worksheets #10, #11, and #12. The usability assessment process is provided in this worksheet.

Verifying the attainment of the DQO statements should be conducted as follows:

- Verification should generally be done by the data user perspective(s) that will be using the data.
- Verification of DQO attainment must be completed before the data are used by the data users.
- All data quality requirements of a DQO statement should be verified.
- Verification of DQO attainment typically is required to ensure contract compliance.

Appropriate corrective actions should be taken whenever data obtained are inadequate for the intended use(s). After completing an assessment of the effects of a missed DQO, the source or cause for missing the DQO should be investigated and understood by the team. When necessary, and if possible, resampling and/or reanalysis then should be performed at the expense of the responsible party (e.g., government, contractor, or laboratory).

D. Data Quality Assessment

As part of the SI Report, Leidos will submit a data quality assessment (DQA) summary. The DQA summary will reference the SI Report appendix where the analytical data packages and data validation checklists can be found and will summarize the samples collected and the analytical parameters associated with each sample. An explanation of how the data are reported as they relate to the laboratory detection limit, limit of detection, and limit of quantitation will be provided, followed by a discussion of factors that affect data usability for PFOS and PFOA. Any rejected data and the reasons for rejection will be described. Details regarding non-rejected qualified data will be included in the referenced appendix, which contains the data validation checklists. The DQA also will include a brief discussion of precision, accuracy, representativeness, completeness, comparability, and sensitivity.

INTRODUCTION

This site-specific Site Safety and Health Plan has been developed for work to be conducted by Leidos on behalf of the Air National Guard (ANG) at 15 ANG Installations. Work is being conducted under National Guard Bureau Contract Number DW9133L-14-D-0007, Task Order 0011. This plan complies with all applicable requirements of Section 1.4.1 and Appendix A of the *Air National Guard Environmental Restoration Program Investigation Guidance* (ANG 2009).

LOCATION(S): MULTIPLE AIR NATIONAL GUARD INSTALLATIONS

SITE DESCRIPTION

Preliminary Assessment Reports prepared for 15 Installations in 11 states identified a total of 136 areas of concern (herein referred to as potential release locations [PRLs]) for site inspection (SI) activities. The locations at all Installations used or stored aqueous film-forming foam (AFFF) and are similar across all Installations. PRLs at the Installations consist of the following:

- Fire training areas (FTAs),
- Fire stations,
- Fire truck equipment testing and maintenance areas,
- Locations where aircraft fuel emergency response activities were conducted,
- Hangers and buildings where testing or emergency activation of AFFF fire suppression systems have occurred,
- Hangers or buildings with fire suppression system releases due to malfunctions,
- Stormwater and/or surface water locations (drainage canals, outfalls, wastewater treatment plants, or AFFF ponds), and
- Other spills and releases.

The sites are located on active military Installations in relatively flat, open grassy areas and/or concrete surfaces in the former FTAs, fire stations, hangers, or buildings. Hearing protection in the vicinity of the aircraft maintenance areas and flight line will be required as a result of aircraft noise.

The SIs will be conducted at the Installations listed in Table 1.

Table 1. Installations, Locations, and Total PRLs

Number	Installation	State	PRLs
1	Rosecrans Memorial Airport	Missouri	8
2	Lambert St. Louis International Airport	Missouri	5
3	Great Falls International Airport	Montana	8
4	Des Moines International Airport	Iowa	14
5	Sioux Gateway Municipal Airport	Iowa	9
6	Hector Field International Airport	North Dakota	10
7	Lincoln Municipal Airport	Nebraska	13
8	Reno Tahoe International Airport	Nevada	11
9	Boise International Airport	Idaho	8
10	Tulsa International Airport	Oklahoma	7
11	Will Rogers International Airport	Oklahoma	9
12	Ellington Field (Houston)	Texas	9
13	Klamath Falls International Airport (Kingsley Field)	Oregon	7
14	Portland International Airport	Oregon	9
15	Cheyenne Municipal Airport	Wyoming	9

PRL = Potential release location.

SCOPE OF WORK TO BE PERFORMED BY LEIDOS AND SUBCONTRACTORS

Leidos has been tasked by ANG to conduct SIs for perfluorinated compounds (PFCs), more specifically per- and polyfluoroalkyl substances, including perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA), at 15 ANG Installations. The project scope was outlined in the *Statement of Objectives for FY17 Phase III Regional Site Inspections for Perfluorinated Compounds at Multiple Air National Guard Installations* (NGB 2017).

The scope of the SI field activities includes soil sampling via hand augers, direct-push technology (DPT), and potentially using hollow-stem augers (HSAs); installation of temporary piezometers and permanent monitoring wells using DPT and HSA methods; well development; groundwater sampling of temporary piezometers (water level measurements only) and permanent monitoring wells; abandonment of soil borings; surface water and sediment sampling; and management of investigation-derived waste (IDW). Soil borings will typically be advanced to the water table, bedrock interface, or to a maximum depth of 25 ft below ground surface (BGS), whichever occurs first.

Leidos will conduct all well development activities; hand augering for soil sample collection; and soil, sediment, surface water, and groundwater sampling. Leidos will provide oversight of drilling/DPT activities, well installation, abandonment of soil borings, and waste management activities. Drilling activities will be performed by an approved subcontractor.

UNDERGROUND UTILITY CLEARANCE

Prior to conducting any field activities, the sample locations will be staked within the investigation area. Leidos will ensure the approved subcontractor contacts the state's One-Call System to locate and mark utilities in the investigation area. In addition, utility clearance requests will be submitted to Base Civil Engineering to locate any utility lines installed by the Base. Hand augering will be conducted to clear the first 5 ft of each borehole to ensure sample locations are free of utilities in accordance with Leidos procedures.

ASPHALT/CONCRETE CUTTING

A coring drill or concrete saw will be used to cut through asphalt and/or concrete as required prior to augering, DPT, and HSA activities. Borings and monitoring wells will be installed in grassy areas adjacent to asphalt/concrete and buildings whenever possible.

SOIL SAMPLING

Soil borings will be advanced using hand augers, DPT, or HSA. Soil samples will be collected from each soil boring. Soil borings will be advanced to the water table, bedrock interface or to a maximum depth of approximately 25 ft BGS, whichever comes first. Approximately two soil samples will be collected per soil boring—one from the surface interval (0 to 2 ft BGS), and one from immediately above the water table or bedrock interface.

TEMPORARY PIEZOMETER INSTALLATION

Temporary piezometers will be installed to investigate the depth to groundwater and to determine groundwater flow direction. Each temporary piezometer will consist of a 1-in.-diameter polyvinyl chloride (PVC) well casing and 10-ft screen set to straddle the water table. The temporary piezometers(s) will be installed using hand augers, DPT, or HSA.

MONITORING WELL INSTALLATION

Permanent monitoring wells will be installed to investigate the groundwater flow direction and to allow for multiple rounds of groundwater sampling, if required. Each monitoring well will consist of a 2-in.-diameter PVC well casing and 10-ft screen set to straddle the water table. The permanent monitoring wells will be installed using DPT or HSA methods. All components of the DPT and HSA must be Teflon®-free.

WELL DEVELOPMENT

Well development of newly installed permanent monitoring wells will be initiated no sooner than 48 hr after placement of annular grout to the ground surface. The monitoring wells installed during this project will be developed using the pump-and-surge method with Teflon®-free submersible pump and tubing. Wells will be developed until water quality parameters (i.e., pH, temperature, conductivity, dissolved oxygen, oxidation-reduction potential, and turbidity) are stable, as defined in the SI Work Plan.

GROUNDWATER SAMPLING OF PIEZOMETERS AND MONITORING WELLS

Groundwater samples will be collected from each newly installed permanent monitoring well and existing wells (where applicable). Samples will be collected using disposable Teflon®-free tubing and a peristaltic pump or a bladder pump.

No groundwater samples will be collected from temporary piezometers. Water level measurements from temporary piezometers will be used to obtain depth to the water table to determine groundwater flow direction in the absence of sufficient permanent monitoring wells.

ABANDONMENT

Temporary piezometers will be abandoned by removing the well casing and tremie grouting or filling with bentonite pellets to the ground surface. If the well casing cannot be removed, the temporary piezometers will be abandoned in place by tremie grouting to the ground surface. Soil borings will be abandoned by tremie grouting or filling with bentonite pellets to the ground.

SURFACE WATER SAMPLING

Surface water samples will be collected from ambient flow prior to sediment sample collection to avoid sediment sampling-induced turbidity. Surface water samples will be collected directly from the selected location by one of the following methods:

- Peristaltic pump with dedicated tubing.
- High-density polyethylene/low-density polyethylene (HDPE/LDPE) dedicated/disposable bailer with HDPE/LDPE check ball (no Teflon®).
- Stainless steel reusable cup/scoop/dipper and decontamination.
- Dedicated HDPE/LDPE container, such as a laboratory bottle without preservative. Submerge the container just below the water surface to fill, and then transfer the collected water to the laboratory bottle with preservative.

All surface water sample locations will be mapped with a handheld digital global positioning system (GPS) device with sub-meter accuracy prior to demobilization. Surface water sampling locations include storm drain outfalls, drainage channels, or from the shore of retention ponds. It is anticipated that all surface water sampling locations will be less than 2 ft deep. If deeper water is encountered, appropriate safety precautions (e.g., flotation devices) will be taken.

SEDIMENT SAMPLING

Sediment samples will be collected directly from the selected location at 0.5 ft BGS using decontaminated stainless steel sampling trowels, hand auger, or a dredge. All sediment sample locations will be mapped with a handheld GPS device with sub-meter accuracy prior to demobilization.

INVESTIGATION-DERIVED WASTE SAMPLING

IDW, including soil, purge water, and decontamination water, will be containerized in drums. Groundwater and soil analytical results will be used for waste characterization of the water and soil.

POTENTIAL HAZARDS AND EMERGENCY INFORMATION

POTENTIAL HAZARDS
Non-project personnel proximity to field activities: passersby in/near work zone.
Traffic accidents associated with travel to and from the site.
Exposure to onsite contaminants: PFOS/PFOA, volatile organic compounds (VOCs) associated with jet fuel.
Exposure to chemicals used onsite: gasoline, isobutylene gas, Liquinox®, and Trizma preservative.
Noise: aircraft testing and flight line, pumps, generators, DPT/drill rigs, and coring drills/concrete saws.
Water hazards (e.g., drowning).
Lifting/moving material/equipment >50 lb weight.
Entanglement due to rotating machinery.
Pressurized air and fluids.
Overhead hazards (e.g., drill rig masts).
Confined spaces (no confined space entry is planned or permitted).
Exposure to temperature or weather extremes (hurricanes).
Sun/ultraviolet exposure.
Pinch/crush.
Slip/trip/fall.

Cut/contusion.
Muscle strain to back/shoulder/arm from augering.
Poisonous plants (poison ivy, oak, and sumac).
Stinging insects and allergic reactions to the venom (e.g., bees and wasps).
Mosquitoes and mosquito-borne illnesses (i.e., West Nile Virus).
Fire ants.
Ticks and tick-borne illnesses (i.e., Rocky Mountain Spotted Fever, turlaremia, Lyme disease, anaplasmosis, babesiosi, rikettsia parkeri ricketsiosis, and ehrlichiosis).
Venomous snakes (e.g., cottonmouths, copperheads, and rattlesnakes).
Fire.

WORKCARE MEDICAL FACILITY

For non-emergency, work-related injuries to Leidos employees, WorkCare should be contacted at (888)-449-7787 for medical consultation. At the onset of a non-emergency, work-related injury or illness, notify the Site Health and Safety Officer (SHSO). The SHSO should then contact WorkCare's Incident Management team to report the incident. The WorkCare Case Manager will assess the injury telephonically and provide guidance, including recommendations regarding follow-up medical attention. During this process, the Case Manager will do the following:

- Explain the process to the caller.
- Determine the nature of the concern.
- Provide appropriate medical advice to the caller.
- Maintain appropriate medical confidentiality.
- Help the caller to execute the path forward, including referral to the appropriate local medical facility (with address or directions) where necessary.
- Send an email notification to the Leidos Environmental Health and Safety (EH&S) contact.

After assessing the incident, the Case Manager may recommend that seeking additional medical attention is unnecessary. If that recommendation has been made, the Case Manager will provide instructions on appropriate first-aid treatment over the telephone.

Injuries or illnesses to site personnel, however minor, and all calls to WorkCare shall be reported to EH&S and up the management chain as soon as is reasonably possible. Contact information for key personnel is provided in Table 2.

EMERGENCY EQUIPMENT REQUIRED ONSITE

Cellular or satellite phone (or verify immediate access to available landline).

First aid kit: 10-unit unitized kit or larger.

Fire extinguisher(s) rated at least 2A and 5B, serviced annually and inspected monthly.

Eyewash rated for 15-min continuous flow if corrosive chemicals are poured or used (pre-preserved sample containers excluded) for sample preparation/preservation or onsite water treatment.

Eyewash bottle if adding water to pre-preserved containers.

EMERGENCY REPORTING

The Field Manager (FM)/SHSO will immediately report injuries or illnesses, vehicle accidents, releases (e.g., hazardous material, hazardous waste, or uncharacterized waste), inspections by regulatory agencies, and any incident that could reasonably have caused a significant injury or property damage (e.g., fire, catastrophic equipment failure, capsized heavy equipment, etc.). The FM/SHSO will contact emergency response organizations (if needed) and the Project Manager. The Project Manager will notify the client (as appropriate), Division Manager, Program Manager, and EH&S Manager. If the Project Manager is not available, the FM/SHSO will make the other notifications. See EH&S Procedure 4.1, Incident Reporting and Investigation (Attachment A of this document), and Procedure 21, Regulatory Agency Inspections and Related Reporting (Leidos 2017), for details.

GENERAL HAZARD CONTROLS APPLICABLE TO ALL WORK IN THIS PROGRAM

This plan represents a good-faith effort to identify, evaluate, and prescribe controls for the hazards that will be posed by this work. Revisions to this plan will be documented. The Project Manager and EH&S Manager who originally approved the plan must approve revisions to the plan that result in

decreasing or eliminating a hazard control.

The FM/SHSO will ensure that applicable provisions of EH&S procedures are followed and that personnel have access to these procedures. Specifically applicable procedures include, but are not limited to, the following:

- Procedure 4, Incident Reporting and Investigation;
- Procedure 8, Hazard Communication Program;
- Procedure 12, Medical Clearance and Surveillance;
- Procedure 13, Personal Protective Equipment;
- Procedure 15, Hearing Conservation and Noise Control;
- Procedure 20, Hazardous Waste Operations;
- Procedure 21, Regulatory Agency Inspections and Related Reporting;
- Procedure 24, Hazardous Material Transportation;
- Procedure 26, Electrical Safety;
- Procedure 32, Vehicle Operation;
- Procedure 33, Subsurface Asset and Hazard Avoidance;
- Procedure 38, Machine Shop, Hand and Power Tool Safety;
- Procedure 43, Bloodborne Pathogen Exposure Control;
- Procedure 46, Management of Waste Generated at Project Sites;
- Procedure 50, Manual Lifting;
- Energy, Environmental Science and Engineering (EESE) Procedure 1, Behavior Based Safety;
- EESE Procedure 2, Subcontractor Environmental, Health and Safety; and
- EESE Procedure 3, Injury/Illness Management.

The FM/SHSO will perform and document daily safety inspections to verify that the work is performed safely, that the requirements of this plan are met, that the public is not endangered by this work, and that no environmental releases or violations occur as a result of this work. All onsite personnel will be responsible to report unsafe, or potentially unsafe, conditions to the FM/SHSO immediately. The FM/SHSO will take action to correct any work that he/she judges to be unsafe or non-compliant with this plan.

The FM/SHSO will establish local assembly points for each work zone so that, in the event of an evacuation, personnel can be accounted for at a pre-identified location. This should include a general assembly point a safe distance along the route of travel when traveling between remote work zones.

Leidos employees and subcontractors will be informed of the requirements of this plan and will be provided with copies or unrestricted access to this plan and must comply with the requirements of this plan. This plan does not relieve subcontractors of the regulatory requirement to provide a safe workplace for their employees. Leidos subcontractors are required to provide trained, experienced personnel and to operate equipment as required by the manufacturer's procedures, or the subcontractor's written standard operating procedures, and are required to supplement the requirements of this plan as necessary to ensure that their employees perform their specific tasks safely.

Project training will include at least the following:

- The FM/SHSO will have current hazardous waste safety training (40 hr, 3 days of on-the-job training [OJT], and 8-hr refresher within the past 12 months), hazardous waste supervisor training, and sufficient experience to understand the potential hazards.
- All other field personnel will have current hazardous waste safety training (including 40-hr, 3-day OJT, and current refresher).
- Subcontractor supervisors will be required to provide proof of current hazardous waste safety training (40 hr, 3 days OJT, and 8-hr refresher within the past 12 months), hazardous waste supervisor

training, and sufficient experience to understand the potential hazards.
The FM/SHSO will present a project kickoff safety briefing to cover this plan, physical hazards, hazardous contaminants and chemicals, required hazard controls, and emergency contacts and additional safety briefings as needed (at least once per week). During drilling operations, at least two people onsite will have current first aid, cardiopulmonary resuscitation, and bloodborne pathogen training. During groundwater sampling activities, only one person may be onsite. When working alone, the FM is required to conduct daily check-ins with the Task Manager (morning, noon, and at the end of the day). Skid steer operators will provide documentation of current training for the class of equipment to be used. The FM/SHSO will maintain documentation of completed training onsite. See Procedure 8, Hazard Communication Program; Procedure 20, Hazardous Waste Operations; and Procedure 22, Powered Industrial Trucks, for details. Additional training may include, but not be limited to, Procedure 15, Hearing Conservation and Noise Control.
Field personnel must be enrolled in a medical surveillance program and have current hazardous waste medical clearance.
Field personnel will utilize personal protective equipment (PPE) as directed in this plan and by Procedure 13, Personal Protective Equipment, and Procedure 15, Hearing Conservation and Noise Control. PPE for fieldwork will include at least safety glasses with side shields; appropriate shoes (up to safety-toe shoes with metatarsal guards); and work clothing, including long pants and shirts with sleeves, hard hats if overhead hazards are present, hearing protection in noisy environments (e.g., near DPT/drill rigs, flight line, or generators), nitrile gloves if handling (potentially) hazardous chemicals, and heavy-duty work gloves for material handling. No Tyvek® clothing will be utilized, and clothes treated with stain- or rain-resistant coatings will be avoided or required to have gone through several washings. It is not anticipated that any of the planned sediment and/or surface water sample locations will require that hip waders and/or a personal flotation device (PFD) be worn. The FM/SHSO will evaluate PPE during routine inspections and will ensure that PPE is appropriate to the task. If site conditions appear to require the implementation of respiratory protection, the FM/SHSO will suspend the impacted task and contact the Project Manager and the health and safety reviewer for guidance.
Sediment and surface water sampling will be conducted when water levels within the stormwater outfall, drainage ditch, or retention pond are low (i.e., below 2 ft). Monitor the weather forecast and do not begin sampling if a precipitation event is predicted to occur before sampling is complete. Hip waders must be worn and a change of clothes must be available if sampling in cold weather. If sampling surface water greater than 2 ft deep (i.e., near stormwater retention ponds), a PFD must be worn and a throw rope with ring buoy must be easily accessible in the event that a worker loses his/her footing in the water and requires rescue.
Insect bites/stings/illnesses and tick-borne illnesses may represent a hazard for fieldwork during active times of the year for these organisms. Identify active times of the year/day and schedule activities to minimize exposure. Inspect the area for evidence of these organisms. Avoid areas where ticks/stinging insects are likely to be encountered. Inform the FM/SHSO of any allergies to stings and the location of epinephrine pens (i.e., EpiPen®). Clothing treated with permethrin will be used by project personnel working outside of buildings/off pavement. N,N-Diethyl-meta-toluamide (i.e., DEET) may be used to repel insects in addition to permethrin-treated clothing. Pants legs will be taped to prevent entry of ticks/ants. Head nets may be needed during mosquito swarming.
Prior to any drilling, the location must be verified free of subsurface assets (tanks) or utilities. See EH&S Procedure 33, Subsurface Asset and Hazard Avoidance, for details. The drilling subcontractor is not relieved of their responsibility to ensure the safety of drilling locations.
Venomous snakes may represent a hazard for fieldwork during active times of the year for these organisms. Identify active times of year/day and schedule activities to minimize exposure. Inspect the area for evidence of these organisms. Avoid areas where these organisms are likely to be encountered.

Relocate the sample site and avoid disturbing the organism. Do not approach or attempt to drive off these animals. The venomous snakes that could be encountered at these facilities include cottonmouths, copperheads, and rattlesnakes. Where a potential to encounter venomous snakes exists or where there is vegetation that prevents one from seeing the ground, use snake chaps as additional PPE.
Field activities involving lifting, bending, and twisting can contribute to muscle strains, including injury to the back. Proper positioning during movements will minimize risks of injury. All employees must comply with EH&S Procedure 50, Manual Lifting.
Onsite aircraft engines and field equipment, such as drill rigs, generators, compressors, and concrete saws, will generate noise that can contribute to hearing loss. Hearing protection is to be worn whenever noise levels are anticipated to exceed 85 decibels (typically within 25 ft of the source of noise). Personnel shall remain 25 ft from the noise source where possible.
Rotating machinery poses a risk of entanglement. Employees are to avoid wearing lose clothing, oversized gloves, jewelry, and/or other attire that might become trapped between moving parts when required to work close to rotating parts. Rotating parts should be shielded, and all non-essential employees to the task at hand should maintain an appropriate distance from moving components.
Portable electrical tools will be connected through a ground fault circuit interrupter. No energized electrical components will be exposed to potential personnel contact. Conductive materials will be kept at least 10 ft from overhead power lines.
Drill rigs and compressors used for well development use pressurized air and fluids that pose a risk of injury. All equipment using pressurized fluids/air must be properly maintained and inspected prior to use for any signs of damage. All connections must be secure prior to operation. Equipment showing signs of damage or excessive wear and tear may not be used.
Drill rig masts and drill strings pose overhead hazards. An exclusion zone twice the height of the drill mast will be setup around the rig, and only essential personnel allowed within. Hard hats must be worn within 25 ft of an overhead hazard.
All vehicle operators must have valid driver's licenses and operate in compliance with applicable laws and regulations. Prohibited actions include driving while distracted and driving while using a cell phone. See EH&S Procedure 32, Vehicle Operation, for details.
Prior to the field start, the weather should be monitored and potential severe weather conditions should be tracked. The field crew should not mobilize to the site if a hurricane or significant weather event is projected to make landing in the vicinity of the site during the scheduled fieldwork. The field crew also should not mobilize to the field following a hurricane or significant weather event in the area unless safe travel and field conditions can be confirmed. Weather conditions during the field job should be monitored. In the event of an incoming hurricane, all field crew should evacuate inland.
No confined space entry is permitted.
Check the daily weather report before mobilizing to the site. Weather conditions will be monitored by the FM. Identify the nearest sturdy storm shelter. Outdoor fieldwork will not be conducted during thunderstorms, and fieldwork will not resume until at least 30 min have passed since observing lightning or hearing thunder.

General controls for preventing heat stress-induced illness include making fluids readily available, using the buddy system, taking scheduled or unscheduled breaks in a cooler area, providing shade, scheduling work during cooler parts of the day, providing forced ventilation, encouraging physical fitness, and application of prudent judgment by the FM/SHSO and crew (Adapted from the *American Conference of Governmental Industrial Hygienists Threshold Limit Value Booklet* [ACGIH 2017]):

- If ambient temperatures reach or exceed 80ºF, workers will be allowed to take unscheduled breaks, as needed, in a cooler area. A break is defined as minimal physical activity (sitting or standing) and should be accomplished in the shade, if possible.

- If ambient temperatures reach or exceed, or are expected to reach or exceed, 80ºF, site-specific training will include heat stress recognition and control and first aid for heat stress-induced illnesses.

- If ambient temperatures reach or exceed, or are expected to reach or exceed, 80ºF, cooled water and Gatorade® or equivalent drink will be made conveniently available to site workers, and site workers will be encouraged to drink frequently.

Critical factors in preventing cold stress disorders are adequate clothing and staying dry. The FM/SHSO will ensure the capability to quickly move individuals who become wet to a sheltered, warm area. The following specific steps will be taken (adapted from the *American Conference of Governmental Industrial Hygienists Threshold Limit Value Booklet* [ACGIH 2017]):

- If ambient temperatures are 40ºF or below, site training will include prevention of cold injury, cold injury symptoms, and cold injury first aid.

- A heated break area will be provided if ambient temperatures are below 32ºF.

- At a minimum, breaks will be taken in a warm area every 120 min if ambient temperatures are below 32ºF.

Workers will maintain a safe distance equivalent to the full, extended reach of all moving/mobile equipment. The counterweight swing area will be posted with danger tape. Approach mobile/moving equipment only after getting permission of the operator. Maintain visual contact with equipment operators at all times.

Flammable and combustible liquids (e.g., gasoline) will be transported and stored in metal containers approved by Factory Mutual, Underwriters Laboratories, or equivalent or in containers provided by the vendors (e.g., isopropanol). Containers of hazardous chemicals must be labeled to indicate contents and hazard. Safety Data Sheets (SDSs) for hazardous chemicals must be available onsite (see Attachment B). Shipment and transportation of hazardous materials must be performed per U.S. Department of Transportation (DOT) or International Air Transport Association (IATA) requirements. See EH&S Procedure 24, Hazardous Material Transportation.

An exclusion zone (at least barricade tape) will be established around any work that poses a risk of exposure to hazardous contaminants, hazardous chemicals, or physical hazards to exclude unauthorized personnel. No food or drink will be allowed in exclusion zones. Personnel will wash their hands prior to eating or drinking. The FM/SHSO will determine if additional controls, such as sawhorse barricades, traffic cones, or additional personal decontamination, are needed.

Regulated (and potentially regulated) project waste will be managed per the intent of EH&S Procedure 46, Management of Waste Generated at Project Sites. Containers of potentially regulated wastes must be labeled or indelibly marked to indicate at least the contents (including the physical state), date placed in container, source, and client's name. Hazardous waste should not be transported on public roadways.

Site Contaminants. Site contaminants, such as VOCs associated with jet fuel, may be present during the proposed fieldwork in environmental media. PFOS/PFOA are not anticipated to be encountered at concentrations that would pose a risk to human health via dermal or inhalation pathways; however, these

compounds are potentially present in local groundwater above health advisory levels. Site contaminants are not expected to be encountered at concentrations that would present an occupational exposure hazard; however, the potential exists for low concentrations of any of these chemicals to be present within environmental media, and proper precautions (i.e., PPE) should be used to prevent exposure.

Chemical Tools. The hazardous chemical tools to be used during the proposed fieldwork include gasoline, isobutylene, Liquinox®, and Trizma. Gasoline and diesel fuel may be present onsite in portable containers to power equipment, such as vehicles and generators. Isobutylene is a calibration gas that will be used to calibrate the photoionization detector for breathing zone monitoring. Liquinox® is a laboratory-grade non-phosphate detergent that will be used for sampling equipment decontamination. Trizma is a preservative that will be used for surface and groundwater samples. Containers of these hazardous chemicals, plus additional chemical tools, such as spray paint and insect repellant, must be labeled to indicate contents and hazard. SDSs for all hazardous materials must be available onsite (see Attachment B). Shipment and transportation of hazardous materials must be performed per DOT or IATA requirements. See EH&S Procedure 24, Hazardous Material Transportation, for guidance.

The FM/SHSO will ensure that equipment and supplies are available to control and remove potential spills of chemicals or contaminants. The required equipment and supplies will vary by project and type and quantity of contaminants/chemicals and may include sorbent pads, granular sorbent, sorbent boom, open-top drums, shovels, etc.

Each employee is empowered and expected to stop his or her own work or the work of co-workers if any person's safety or the environment is at risk. The FM/SHSO is expected to support and reinforce this expectation. Stopped work will not resume until the hazard has been controlled and a review has been performed.

Each major task must have an activity hazard analysis (AHA), and the work must be performed as required by the AHA.

ACTIVITY HAZARD ANALYSIS WORK ACTIVITY: WELL DEVELOPMENT AND SAMPLING OF TEMPORARY PIEZOMETERS AND PERMANENT MONITORING WELLS		
PPE	**Selected**	**Comment**
Safety Shoes	X	See note
Hard Hat		
Safety Glasses with Side Shields	X	
Fire-Resistant Clothing		
Face Shields		
Goggles		
Lifeline/Body Harness		
Hearing Protection	X	In vicinity of flight line or aircraft maintenance activities
Air-Purifying Respirator		
Welding Hood		
Welding/Pipe Clothing		
Welding Mask/Goggles		
Personal Floatation Device		
Gloves	X	Nitrile gloves for all sampling activities and handling potentially contaminated equipment
Safety Cones/Barricades	X	To control/alert traffic and exclude unauthorized personnel
Safety Vest	X	If near active traffic areas
Knee Pads		
Snake Boots/Chaps/Guards	X	As needed
Caution/Danger Tape	X	As needed to exclude unauthorized personnel

NOTE: Do not wear water-resistant, waterproof, or stain-treated clothing during the field program. Field clothing made of synthetic and natural fibers (preferably cotton) is acceptable. Field clothing should be laundered avoiding the use of fabric softener. Preferably, field gear should be cotton construction and well laundered (a minimum of six times from time of purchase). New clothing may contain perfluorinated compound (PFC)-related treatments. Do not use new clothing while sampling or sample handling.

Do not wear clothing or boots containing Gore-Tex® during the sampling program as it consists of a PFC membrane.

All safety footwear will consist of steel-toed boots made with polyurethane and polyvinyl chloride.

Do not wear Tyvek® clothing onsite as it contains fluorinated compounds.

Disposable nitrile gloves must be worn at all times. Further, a new pair of nitrile gloves should be donned prior to the following activities at each sample location:

- Decontamination of reusable sampling equipment;
- Contact with sample bottles or water containers;
- Insertion of anything into the well (e.g., high-density polyethylene tubing, HydraSleeve bailer, etc.);
- Insertion of silicon tubing into the peristaltic pump;
- Completion of monitoring well purging, prior to sample collection;
- Handling of any quality assurance/quality control samples, including field blanks and equipment blanks; and
- After handling any non-dedicated sampling equipment, contact with non-contaminated surfaces, or when judged necessary by field personnel.

PPE = Personal protective equipment.

Well Development and Sampling of Temporary Piezometers and Permanent Monitoring Wells		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
Sampling/ Development	General safety hazards	Level D PPE (no Tyvek® or Gore-Tex®), buddy system, HAZWOPER 40-hr training, and standard procedures
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Avoid trip hazards and wet surfaces. Ensure housekeeping keeps area clear of equipment and lines
	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic and parking lots. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Maintain awareness of parked and moving vehicles in the surrounding area. Artificial lighting provided for work after twilight
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding if rain is forecast in the immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event
	Noise	Hearing protection in the vicinity of the flight line or aircraft maintenance areas
	Lifting (musculoskeletal injuries) hazards	Compliance with EH&S Procedure 50, Manual Lifting. If equipment is to be moved, an evaluation of potential pinch points and/or weight strain will be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance will be used onsite if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning
	Unauthorized personnel in work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone

Well Development and Sampling of Temporary Piezometers and Permanent Monitoring Wells		
Job Step	**Potential Hazard**	**Critical Action**
	Fire	Fire extinguisher rated 2A and 5B (serviced annually and inspected monthly) in all fuel use areas
	Chemical exposure	Breathing zone monitoring with 10.6-eV PID; stop work action level of 5 ppm sustained for over 1 min. Medical clearance for hazardous waste work. 40-hr HAZWOPER and current refresher for workers. 8-hr additional supervisor for FM, SHSO, and all other onsite supervisors. Wash hands before eating or drinking. Nitrile gloves for chemical/contaminant contact. Chemical containers labeled with identity and hazard. SDSs onsite for all chemicals in use. Site-specific training must address chemicals, hazards, and proper handling
	Biological hazard	Inspect area for hazardous plants and organism conditions. Avoid such areas if possible. Wear clothing that covers potentially affected body parts. Seal pants legs against contact with plants and to prevent access by ticks/ants. Pretreat clothing with permethrin. Use insect/tick repellant (>30% DEET) to supplement. Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Wear snake chaps if one cannot see the ground due to vegetation. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac
Containing and managing decontamination fluids, purge water, and other IDW	General safety hazards	Level D PPE, buddy system, HAZWOPER 40-hr training, and standard procedures
	Slips/Trips/Falls	Visually scan area ahead for hazards before proceeding. Avoid trip hazards and wet surfaces
	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades. Maintain awareness of parked and moving vehicles in the surrounding area. High-visibility safety vests in traffic areas. Artificial lighting provided for work after twilight
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Unauthorized personnel in work zone	Exclude non-site workers from work area using barrier tape
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event
	Noise	Hearing protection in the vicinity of the flight line or aircraft maintenance areas

ACTIVITY HAZARD ANALYSIS		
WORK ACTIVITY: SOIL SAMPLING VIA HAND AUGER		
PPE	**Selected**	**Comment**
Safety Shoes	X	See note
Hard Hat	X	Within 25 ft of DPT or other overhead hazards[a]
Safety Glasses with Side Shields	X	
Fire-Resistant Clothing		
Face Shields		
Goggles		
Lifeline/Body Harness		
Hearing Protection	X	In vicinity of flight line or aircraft maintenance activities or within 25 ft of DPT/drill rig, concrete saw, or drill[a]
Air-Purifying Respirator		
Welding Hood		
Welding/Pipe Clothing		
Welding Mask/Goggles		
Personal Floatation Device		
Gloves	X	Nitrile gloves for all sampling activities. Heavy-duty work gloves for material handling
Safety Cones/Barricades	X	To control/alert traffic and exclude unauthorized personnel
Safety Vest	X	If near active traffic areas
Knee Pads		
Snake Boots/Chaps/Guards	X	As needed
Caution/Danger Tape	X	As needed to exclude unauthorized personnel

NOTE: Do not wear water-resistant, waterproof, or stain-treated clothing during the field program. Field clothing made of synthetic and natural fibers (preferably cotton) is acceptable. Field clothing should be laundered avoiding the use of fabric softener. Preferably, field gear should be cotton construction and well laundered (a minimum of six times from time of purchase). New clothing may contain perfluorinated compound (PFC)-related treatments. Do not use new clothing while sampling or sample handling.

Do not wear clothing or boots containing Gore-Tex® during the sampling program as it consists of a PFC membrane.

All safety footwear will consist of steel-toed boots made with polyurethane and polyvinyl chloride.

Do not wear Tyvek® clothing onsite as it contains fluorinated compounds.

Disposable nitrile gloves must be worn at all times. Further, a new pair of nitrile gloves should be donned prior to the following activities at each sample location:

- Decontamination of reusable sampling equipment;
- Contact with sample bottles or water containers;
- Insertion of anything into the well (e.g., high-density polyethylene tubing, HydraSleeve bailer, etc.);
- Insertion of silicon tubing into the peristaltic pump;
- Completion of monitoring well purging, prior to sample collection;
- Handling of any quality assurance/quality control samples, including field blanks and equipment blanks; and
- After handling any non-dedicated sampling equipment, contact with non-contaminated surfaces, or when judged necessary by field personnel.

(Source: Navy 2015)
[a] Although this equipment is not required for soil sampling via hand auger, it is anticipated that work will be conducted in close proximity to ongoing DPT sampling.
DPT = Direct-push technology.
PPE = Personal protective equipment.

Soil Sampling Via Hand Auger		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
Soil sampling	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Artificial lighting provided for work after twilight
	Overhead hazards	Maintain a distance of 10 ft or more from DPT rigs. Hard hat when working within 25 ft of DPT rig or other overhead hazards
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure good housekeeping is maintained in work area. Avoid trip hazards and wet surfaces
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Muscle strain/back injury	Stretch before starting to turn auger. Use a smooth motion to turn the hand auger; turn with hips more than shoulders to protect the lower back. Do not attempt to force the turn if an obstruction is encountered. If possible, use ratcheting hand augers
	Unauthorized personnel entering work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone
	Subsurface utilities (e.g., electric shock, fire, and damage to utilities)	FM will ensure that each boring location has been cleared to preclude contact with buried utilities through compliance with EH&S Procedure 33, Subsurface Asset and Hazard Avoidance
	Noise	Hearing protection in the vicinity of the flight line or aircraft maintenance areas. Hearing protection when within 25 ft of DPT rig unless equipment-specific monitoring indicates that noise levels are less than 85 decibels. Maintain a 25-ft standoff from DPT when boring
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lightning or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in the immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event

DPT = Direct-push technology.
PPE = Personal protective equipment.

Soil Sampling and Oversight of Piezometer/Well Installation Using Hollow-Stem Augers or Direct-Push Technology		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
Rig set up	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Rig/fork truck equipped with functional backup alarm. Artificial lighting provided for work after twilight
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure subcontractor maintains good housekeeping in work area. Avoid trip hazards and wet surfaces
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Contact with overhead structures or utilities	FM/SHSO will survey location and ensure absence of obstructions and overhead utilities prior to set up. Personnel and equipment will not be allowed to come within 10 ft of overhead power lines. Do not approach closer than twice the height of the raised mast At the time the mast is being towered down, other drill crew members should not be engaged in any other activity; the task at that time is to assist in towering down in the safest manner possible. The mast of the drill rig must be towered down before moving to the next location
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in the immediate area or upstream of the site. Monitor weather reports for hurricanes and evacuate as necessary. 	Falling equipment	No workers under suspended loads. Exclusion zone around rig
	Cuts/contusions	Use dedicated tube cutter or hooked safety blades when opening polymer sample tubes. Wear heavy cut-resistant gloves when opening polymer sample tubes. Keep fingers from between split spoon halves
	Unauthorized personnel entering work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone
	Subsurface utilities (e.g., electric shock, fire, and damage to utilities)	FM will ensure that each boring location has been cleared to preclude contact with buried utilities through compliance with EH&S Procedure 33, Subsurface Asset and Hazard Avoidance
	Noise	Hearing protection in the vicinity of the flight line. Hearing protection when within 25 ft of drill rig unless equipment-specific monitoring indicates that noise levels are less than 85 decibels. Maintain a 25-ft standoff from rig when boring
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in the immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event

Soil Sampling and Oversight of Piezometer/Well Installation Using Hollow-Stem Augers or Direct-Push Technology		
Job Step	**Potential Hazard**	**Critical Action**
	Lifting (musculoskeletal injuries) hazards	Compliance with EH&S Procedure 50, Manual Lifting. If equipment is to be moved, an evaluation of potential pinch points and/or weight strain will be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used onsite if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning
	Biological hazard	Inspect area for hazardous plants and organism conditions. Avoid such areas if possible. Wear clothing that covers potentially affected body parts. Seal pants legs against contact with plants and to prevent access by ticks/ants. Pretreat clothing with permethrin. Use insect/tick repellant (>30% DEET) to supplement. Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac
	Fire	Fire extinguisher rated 2A and 5B (serviced annually and inspected monthly) in all fuel use areas
	Chemical exposure	Breathing zone monitoring with 10.6-eV PID; stop work action level of 5 ppm sustained for over 1 min. Medical clearance for hazardous waste work. 40-hr HAZWOPER and current refresher for workers. 8-hr additional supervisor for FM, SHSO, and all other onsite supervisors. Wash hands before eating or drinking. Nitrile gloves for chemical/contaminant contact. Chemical containers labeled with identity and hazard. SDSs onsite for all chemicals in use. Site-specific training must address chemicals, hazards, and proper handling
Piezometer/Well construction or abandonment	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Rig/fork truck equipped with functional backup alarm. Artificial lighting provided for work after twilight
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure subcontractor maintains good housekeeping in work area. Avoid trip hazards and wet surfaces
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Silica/particulate exposure	Visually monitor for dust and stand upwind of work zone
	Noise	Hearing protection in vicinity of flight line or aircraft maintenance areas

Soil Sampling and Oversight of Piezometer/Well Installation Using Hollow-Stem Augers or Direct-Push Technology		
Job Step	**Potential Hazard**	**Critical Action**
	Lifting (musculoskeletal injuries) hazards	Compliance with EH&S Procedure 50, Manual Lifting. If equipment is to be moved, an evaluation of potential pinch points and/or weight strain will be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used onsite if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning

Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac
	Unauthorized personnel in work zone	If structures or public access areas fall within the radius of the raised mast, establish a work schedule to minimize hazard to public, establish an exclusion zone boundary that unauthorized personnel cannot cross, and position drill rig so as to minimize inclusion of public access areas within the work zone
	Electric shock	Portable electrical tools and all portable electrical equipment must be connected through ground fault circuit interrupters
	Fire	Fire extinguisher rated 2A and 5B (serviced annually and inspected monthly) in all fuel use/hot work areas. Clear 30-ft-radius area of combustible/flammable materials during hot work
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. 	IDW control	Label or mark IDW containers to indicate container number, contents (including the physical state), investigation location, date of collection, and client name. Ensure that storage area provides adequate protection against physical damage or disturbance

DEET = N,N-diethyl-meta-toluamide.
DOT = U.S. Department of Transportation.
EH&S = Environmental health and safety.
FM = Field Manager.
FOD = Foreign object debris.
HAZWOPER = Hazardous Waste Operations and Emergency Response.
IDW = Investigation-derived waste.
MUTCD = Manual on Uniform Traffic Control Devices.
PID = Photoionization detector.
PPE = Personal protective equipment.
ppm = Parts per million.
SDS = Safety Data Sheet.
SHSO = Site Health and Safety Officer.

THIS PAGE INTENTIONALLY LEFT BLANK.

ACTIVITY HAZARD ANALYSIS		
WORK ACTIVITY: SOIL SAMPLING VIA DIRECT-PUSH TECHNOLOGY		
PPE	**Selected**	**Comment**
Safety Shoes	X	See notes
Hard Hat	X	Within 25 ft of DPT or other overhead hazards
Safety Glasses with Side Shields	X	
Fire-Resistant Clothing		
Face Shields		
Goggles		
Lifeline/Body Harness		
Hearing Protection	X	In vicinity of flight line or aircraft maintenance activities or within 25 ft of DPT, concrete saw, or drill
Air-Purifying Respirator		
Welding Hood		
Welding/Pipe Clothing		
Welding Mask/Goggles		
Personal Floatation Device		
Gloves	X	Nitrile gloves for all sampling activities. Heavy-duty work gloves for material handling
Safety Cones/Barricades	X	To control/alert traffic and exclude unauthorized personnel
Safety Vest	X	If near active traffic areas
Knee Pads		
Snake Boots/Chaps/Guards	X	As needed
Caution/Danger Tape	X	As needed to exclude unauthorized personnel

NOTE: Do not wear water-resistant, waterproof, or stain-treated clothing during the field program. Field clothing made of synthetic and natural fibers (preferably cotton) is acceptable. Field clothing should be laundered avoiding the use of fabric softener. Preferably, field gear should be cotton construction and well laundered (a minimum of six times from time of purchase). New clothing may contain perfluorinated compound (PFC)-related treatments. Do not use new clothing while sampling or sample handling.

Do not wear clothing or boots containing Gore-Tex® during the sampling program as it consists of a PFC membrane.

All safety footwear will consist of steel-toed boots made with polyurethane and polyvinyl chloride.

Do not wear Tyvek® clothing onsite as it contains fluorinated compounds.

Disposable nitrile gloves must be worn at all times. Further, a new pair of nitrile gloves should be donned prior to the following activities at each sample location:

- Decontamination of reusable sampling equipment;
- Contact with sample bottles or water containers;
- Insertion of anything into the well (e.g., high-density polyethylene tubing, HydraSleeve bailer, etc.);
- Insertion of silicon tubing into the peristaltic pump;
- Completion of monitoring well purging, prior to sample collection;
- Handling of any quality assurance/quality control samples, including field blanks and equipment blanks; and
- After handling any non-dedicated sampling equipment, contact with non-contaminated surfaces, or when judged necessary by field personnel.

DPT = Direct-push technology.
PPE = Personal protective equipment.

Soil Sampling Via Direct-Push Technology		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
DPT set up	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Rig equipped with functional backup alarm. Artificial lighting provided for work after twilight
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure subcontractor maintains good housekeeping in work area. Avoid trip hazards and wet surfaces
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Contact with overhead structures or utilities	FM/SHSO will survey location and ensure absence of obstructions and overhead utilities prior to set up. Personnel and equipment will not be allowed to come within 10 ft of overhead power lines. Do not approach closer than twice the height of the raised mast
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in the immediate area or upstream of the site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event
	Noise	Hearing protection in vicinity of flight line and aircraft maintenance areas
	Biological hazard	Inspect area for hazardous plants and organism conditions. Avoid such areas if possible. Wear clothing that covers potentially affected body parts. Seal pants legs against contact with plants and to prevent access by ticks/ants. Pretreat clothing with permethrin. Use insect/tick repellant (>30% DEET) to supplement. Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac
	Unauthorized personnel entering work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone

Soil Sampling Via Direct-Push Technology		
Job Step	**Potential Hazard**	**Critical Action**
Concrete coring or asphalt cutting	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Artificial lighting provided for work after twilight
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure subcontractor maintains good housekeeping in work area. Avoid trip hazards and wet surfaces
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Falling equipment	No workers under suspended loads. Exclusion zone around rig. Do not approach closer than twice the height of the raised mast
	Pinch	Keep hands from between DPT components. Keep fingers out of all openings
	Unauthorized personnel entering work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone
	Subsurface utilities (e.g., electric shock, fire, and damage to utilities)	FM will ensure that each boring location has been cleared to preclude contact with buried utilities through compliance with EH&S Procedure 33, Subsurface Asset and Hazard Avoidance
	Noise	Hearing protection when within 25 ft of concrete saw or drill
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. IDW = Investigation-derived waste.
MUTCD = Manual on Uniform Traffic Control Devices.
PID = Photoionization detector.
PPE = Personal protective equipment.
ppm = Parts per million.
SDS = Safety Data Sheet.
SHSO = Site Health and Safety Officer.

ACTIVITY HAZARD ANALYSIS		
WORK ACTIVITY: SURFACE WATER AND SEDIMENT SAMPLING		
PPE	**Selected**	**Comment**
Safety Shoes	X	See notes
Hard Hat	X	If overhead hazards are present
Safety Glasses with Side Shields	X	
Fire-Resistant Clothing		
Face Shields		
Goggles		
Lifeline/Body Harness		
Hearing Protection	X	In vicinity of flight line or aircraft maintenance activities or within 25 ft of DPT/drill rig, concrete saw, or drill
Air-Purifying Respirator		
Welding Hood		
Welding/Pipe Clothing		
Welding Mask/Goggles		
Personal Floatation Device	X	For water >2 ft deep
Hip Waders	X	For water >2 ft deep
Gloves	X	Nitrile gloves
Safety Cones/Barricades	X	To control/alert traffic and exclude unauthorized personnel
Safety Vest	X	If near active traffic areas
Knee Pads		
Snake Boots/Chaps/Guards	X	As needed
Caution/Danger Tape	X	As needed to exclude unauthorized personnel

NOTE: Do not wear water-resistant, waterproof, or stain-treated clothing during the field program. Field clothing made of synthetic and natural fibers (preferably cotton) is acceptable. Field clothing should be laundered avoiding the use of fabric softener. Preferably, field gear should be cotton construction and well laundered (a minimum of six times from time of purchase). New clothing may contain perfluorinated compound (PFC)-related treatments. Do not use new clothing while sampling or sample handling.

Do not wear clothing or boots containing Gore-Tex® during the sampling program as it consists of a PFC membrane.

All safety footwear will consist of steel-toed boots made with polyurethane and polyvinyl chloride.

Do not wear Tyvek® clothing onsite as it contains fluorinated compounds.

Disposable nitrile gloves must be worn at all times. Further, a new pair of nitrile gloves should be donned prior to the following activities at each sample location:

- Decontamination of reusable sampling equipment;
- Contact with sample bottles or water containers;
- Insertion of anything into the well (e.g., high-density polyethylene tubing, HydraSleeve bailer, etc.);
- Insertion of silicon tubing into the peristaltic pump;
- Completion of monitoring well purging, prior to sample collection;
- Handling of any quality assurance/quality control samples, including field blanks and equipment blanks; and
- After handling any non-dedicated sampling equipment, contact with non-contaminated surfaces, or when judged necessary by field personnel.

(Source: Navy 2015)
PPE = Personal protective equipment.

Surface Water and Sediment Sampling		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
	Noise	Hearing protection if in the vicinity of the flight line and maintenance areas
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
Sampling	General safety hazards	Level D PPE, buddy system, HAZWOPER 40-hr training, and standard procedures
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Avoid trip hazards and wet surfaces. Ensure housekeeping keeps area clear of equipment and lines
	Noise	Hearing protection if in the vicinity of the flight line and maintenance areas
	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades. Maintain awareness of parked and moving vehicles in the surrounding area. High-visibility safety vests in parking lots. Artificial lighting provided for work after twilight
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling). PFD and hip waders must be worn when sampling in water >2 ft deep, and a change of clothes must be available if sampling in cold weather
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding if rain is forecast in the immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event. Do not begin sampling if a precipitation event is predicted to occur before sampling is complete
	Lifting (musculoskeletal injuries) hazards	Compliance with EH&S Procedure 50, Manual Lifting. If equipment is to be moved, an evaluation of potential pinch points and/or weight strain will be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance will be used onsite if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning
	Unauthorized personnel in work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone

Surface Water and Sediment Sampling		
Job Step	**Potential Hazard**	**Critical Action**
	Chemical exposure	Medical clearance for hazardous waste work. 40-hr HAZWOPER and current refresher for workers. 8-hr additional supervisor for FM, SHSO, and all other onsite supervisors. Wash hands before eating or drinking. Nitrile gloves for chemical/contaminant contact. Chemical containers labeled with identity and hazard. SDSs onsite for all chemicals in use. Site-specific training must address chemicals, hazards, and proper handling
	Biological hazard	Inspect area for hazardous plants and organism conditions. Avoid such areas if possible. Wear clothing that covers potentially affected body parts. Seal pants legs against contact with plants and to prevent access by ticks/ants. Pretreat clothing with permethrin. Use insect/tick repellant (>30% DEET) to supplement. Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Wear snake chaps or hip waders if one cannot see the ground due to vegetation. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac
	Drowning	Use the buddy system. PFD and throw rope with ring buoy required when sampling surface water >2 ft deep
Containing and managing decontamination fluids and other IDW	General safety hazards	Level D PPE, buddy system, HAZWOPER 40-hr training, and standard procedures
	Slips/Trips/Falls	Visually scan area ahead for hazards before proceeding. Avoid trip hazards and wet surfaces
	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades. Maintain awareness of parked and moving vehicles in the surrounding area. High-visibility safety vests in traffic areas. Artificial lighting provided for work after twilight
	Unauthorized personnel in work zone	Establish an exclusion zone boundary with caution tape to prevent unauthorized personnel in work zone
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event
	Chemical exposure	Medical clearance for hazardous waste work. 40-hr HAZWOPER and current refresher for workers. 8-hr additional supervisor for FM, SHSO, and all other onsite supervisors. Wash hands before eating or drinking. Nitrile gloves for chemical/contaminant contact. Chemical containers labeled with identity and hazard. SDSs onsite for all chemicals in use. Site-specific training must address chemicals, hazards, and proper handling

PPE = Personal protective equipment.

Investigation-Derived Waste Sampling		
Job Step	**Potential Hazard**	**Critical Action**
Mobilize to work site	Traffic accident	Compliance with EH&S Procedure 32, Vehicle Operation (e.g., valid driver's license, seat belt use, routine vehicle inspections, and no cell phone use while driving)
IDW sampling	General safety hazards	Level D PPE, buddy system, HAZWOPER 40-hr training, and standard procedures
	Slips/Trips/Falls	Observe area ahead for hazards before proceeding. Ensure subcontractor maintains good housekeeping in work area. Avoid trip hazards and wet surfaces
	Being struck by vehicles	Traffic control by 36-in.+ tall traffic cones, barricade tape, and/or sawhorse barricades (more substantial barriers required as traffic hazard increases). Vehicle(s) placed between workers and oncoming traffic. High-visibility safety vests in traffic areas. Flashing rotating beacon in high-traffic parking areas or brief roadwork. MUTCD-compliant traffic control plan for work in road/street, roadside parking strip, sidewalk, and/or shoulder. All required lane closure permits from local traffic control authority must be attached to individual site sheet for work in DOT right-of-way. Artificial lighting provided for work after twilight
	Struck by mobile equipment (forklift/skid steer)	During oversight of drum movement, stand clear from work zone and moving heavy equipment. No personnel under lifted loads
	FOD	Before entering the flight line, drivers must stop and remove foreign materials from the vehicle's tires. Vehicles that leave the pavement at any point must do another FOD check prior to re-entering the flight line, taxiway, or aircraft parking ramp. Good housekeeping must be maintained in work area to ensure objects are not left on or near the flight line
	Noise	Hearing protection in vicinity of flight line or aircraft maintenance areas
	Temperature stress	If temperature is above 80°F or below 40°F, administrative controls will be implemented (e.g., cooled or warmed drinks, routine breaks in heated or shaded area, and provisions for emergency heating or cooling)
	Severe weather	Locate nearest severe weather shelter/strong structure before beginning fieldwork. Avoid water, high ground, open spaces, and metal objects. Suspend fieldwork when lightning is first seen or thunder is first heard until 30 min after last lighting or thunder. Do not work in areas subject to flash flooding (e.g., ditch) if rain is forecast in the immediate area or upstream of site. Monitor weather reports for hurricanes and evacuate as necessary. Do not mobilize to the site if a hurricane is projected to make landing in the vicinity of the site during the scheduled field event
	Lifting (musculoskeletal injuries)	Compliance with EH&S Procedure 50, Manual Lifting. If equipment is to be moved, an evaluation of potential pinch points and/or weight strain will be conducted. Clear area of all unnecessary equipment and slip/trip hazards. Additional help will be obtained by workers or mechanical assistance used onsite if equipment to be moved is unwieldy, has a weight >50 lb, or has to be moved by maneuvering through awkward positioning

Investigation-Derived Waste Sampling		
Job Step	**Potential Hazard**	**Critical Action**
	Chemical exposure	Breathing zone monitoring with 10.2-eV PID. Stop work if breathing zone readings exceed 5 ppm for more than 1 min. Medical clearance for hazardous waste work. 40-hr HAZWOPER and current refresher for workers. 8-hr additional supervisor for FM, SHSO, and all other onsite supervisors. Wash hands before eating or drinking. Nitrile for brief contact, Teflon® or Responder for sustained contact, or similar for potentially contaminated material. Chemical containers labeled with identity and hazard. SDSs onsite for all chemicals in use. Site-specific training must address chemicals, hazards, and proper handling. Eyewash bottle must be within 10 ft if adding water samples to pre-preserved containers
	Spill	Sample over drum top or use adjacent table. Absorbent pad on drum top or table. Spill kit within 20 ft
	IDW control	Label or mark IDW containers to indicate container number, contents (including the physical state), investigation location, date of collection, and client name. Ensure that storage area provides adequate protection against physical damage or disturbance
	Biological hazard	Inspect area for hazardous plants and organism conditions. Avoid such areas if possible. Wear clothing that covers potentially affected body parts. Seal pants legs against contact with plants and to prevent access by organisms. Use insect/tick repellant (>30% DEET and permethrin) whenever possible. Wear snake chaps if poisonous snake habitat is to be entered (e.g., underbrush, high grass, rubble/loose rock, etc.). Review route to hospital if in snake habitat or allergic to insect/spider sting/bite. Do not touch face before thoroughly washing hands with detergent or ivy wash solution if working in poison ivy/oak/sumac

THIS PAGE INTENTIONALLY LEFT BLANK.

The Leidos incident notification contact list is provided in Table 2, and additional contacts are provided in Attachment C.

Table 2. Project Contacts

Personnel	Position/Role	Affiliation	Office Number	Mobile Number
Steve Lowery	Health and Safety Manager	Leidos	(571) 526-6659	(405) 919-4176
Connie Samson	Program Manager	Leidos	(571) 526-7723	(703) 867-6904
Matt Vest	Project Manager	Leidos	(865) 425-4026	(606) 495-5149
Selvam Arunachalam	Deputy Project Manager	Leidos	(571) 830-5139	(571) 830-5139
TBD[a]	FM/SHSO	Leidos	TBD	TBD
Various	Base Environmental Manager	Air National Guard	See Attachment C	See Attachment C
Various	NGB Project Manager	NGB	See Attachment C	See Attachment C

[a] Multiple FMs/SHSOs will be required for project execution. Concurrence with this Site Safety and Health Plan (SSHP) by each identified FM/SHSO is required prior to the start of relevant field activities. A Field Change Notice will be issued and approved prior to fieldwork execution indicating the FM/SHSO has read the Site Inspection Work Plan and SSHP.
FM = Field Manager.
NA = Not applicable.
NGB = National Guard Bureau.
SHSO = Site Health and Safety Officer.
TBD = To be determined.

The Occupational Safety and Health Administration has adopted changes to the Hazard Communication and Chemical Hygiene program and requires that the Globally Harmonized System of Classification be used after June 2015. Table 3 provides a list of SDSs to be included onsite.

Table 3. List of SDSs

Material Name	Purpose of Use	Attachment B Page Number
Gasoline	Fuel	Att. B-3
Trizma	Sample preservation	Att. B-13
Isobutylene Calibration Gas	Instrument calibration (PID)	Att. B-23
Liquinox®	Decontamination	Att. B-29

PID = Photoionization detector.
SDS = Safety Data Sheet.

INCIDENT REPORTING FORM

THIS PAGE INTENTIONALLY LEFT BLANK.

EH&S INCIDENT REPORT

UNCLASSIFIED/LEIDOS PROPRIETARY INFORMATION (When Completed)

Attention: This form contains information relating to employee health and must be used in a manner that protects the confidentiality of employees to the extent possible while the information is being used for occupational safety and health purposes.

INSTRUCTIONS: Investigation and form are to be completed by the immediate supervisor of the employee who was directly involved in the incident or close call. The investigation participants should consist of the immediate supervisor, employee involved in the incident, and appropriate EH&S official/rep (local, division, operation, or corporate). Other personnel such as additional witnesses and subject matter experts should be involved as needed. The investigation must focus on opportunities to minimize the probability of similar incidents both within the immediate organization and elsewhere in the group. Each investigation must include development of specific and verifiable improvement actions. Complete and return Parts I & II promptly (within 24 hours) to the appropriate EH&S Official. In the event of injury or illness requiring medical treatment, complete Part III and contact the Enterprise Shared Services Human Resources Benefits Service Desk to initiate a worker's compensation claim. The remainder of the form is to be completed and returned to the appropriate EH&S Official within 10 days of the incident. Attach additional pages as needed due to any space constraints.

NOTE: Immediately report any fatality or serious injury/illness during a work-related activity to Corporate EH&S (refer to https://prism.leidos.com/docs/DOC-20507). Certain vehicle accidents must also be reported for insurance purposes. Refer to Insurance & Risk Management for guidance.

PART I

GENERAL INFORMATION

INCIDENT DATE:	**INCIDENT TYPE:** ☐ **INJURY/ILLNESS** ☐ **PROPERTY DAMAGE** ☐ **VEHICLE** ☐ **FIRE** ☐ **ENVIRONMENTAL** ☐ **CLOSE CALL**
TIME INCIDENT OCCURRED:	**NAME OF WITNESS (IF APPLICABLE):**
LOCATION (PHYSICAL ADDRESS OR LEIDOS LOCATION #):	**WHERE INCIDENT OCCURRED (EXACT SITE, DEPARTMENT, OR AREA):**

EMPLOYEE INFORMATION

EMPLOYEE'S NAME:	**JOB TITLE:**
LEIDOS EMPLOYEE #:	**LEIDOS DIVISION #:**
TIME EMPLOYEE BEGAN WORK:	**SUPERVISOR'S NAME:**

PART II

INCIDENT DETAILS

WHAT WAS THE INDIVIDUAL DOING JUST BEFORE THE INCIDENT OCCURRED? (OBJECTIVELY DESCRIBE THE ACTIVITY INCLUDING THE TOOLS, EQUIPMENT, MATERIALS, AND HAZARD CONTROLS USED)

WHAT HAPPENED? (STATE OBJECTIVELY HOW THE INCIDENT OCCURRED)	
IN THE EVENT OF INJURY OR ILLNESS, IDENTIFY THE PART OF THE BODY THAT WAS AFFECTED AND HOW IT WAS AFFECTED	WHAT OBJECT OR SUBSTANCE DIRECTLY HARMED THE INDIVIDUAL OR WAS INVOLVED IN THE INCIDENT?

PART III

MEDICAL TREATMENT INFORMATION

IF TREATMENT WAS GIVEN AWAY FROM THE WORKSITE, WHERE WAS IT GIVEN? (FACILITY NAME AND ADDRESS):	
NAME OF PHYSICIAN OR OTHER HEALTH CARE PROFESSIONAL:	DATE EMPLOYEE RETURNED TO WORK:
WAS EMPLOYEE TREATED IN AN EMERGENCY ROOM? ☐ YES ☐ NO	WAS EMPLOYEE HOSPITALIZED AS AN IN-PATIENT? ☐ YES ☐ NO
NATURE OF TREATMENT (e.g., prescriptions, ointment, stitches, cast, splint, etc.):	

INJURY OR ILLNESS (indicate applicable categories below)

☐ **FIRST AID (includes diagnostic evaluation, but not treatment, by medical provider)**

☐ **MEDICAL TREATMENT (prescription medication, stitches, etc.)**

☐ **WORK RESTRICTION SPECIFIED BY PHYSICIAN**

☐ **LOST TIME (missed one or more full days of work as specified by physician)**

PART IV

INCIDENT CAUSES [Check all that apply]

Identify root cause and contributing factors

Site/Facility and Equipment

- ☐ Exposure to hazardous site conditions
- ☐ Poor housekeeping or improper storage
- ☐ Unguarded, defective, or inadequate facility or equipment
- ☐ Improper use of facility or equipment
- ☐ Inadequate or defective design, layout, or ergonomics
- ☐ Lack of facility or equipment availability
- ☐ Other (describe):

Management Issues

- ☐ Inadequate leadership and/or demonstration of expectations
- ☐ Inadequate supervision
- ☐ Inadequate discipline or accountability
- ☐ Poorly defined rules or requirements
- ☐ Inadequate inspection, monitoring, or hazard analysis
- ☐ Culture which allows or encourages unsafe behavior
- ☐ Other (describe):

Employee Issues

- ☐ Inattention, distraction, fatigue, or stress
- ☐ Influence of drugs or alcohol
- ☐ Operating equipment without authority or required training
- ☐ Failure to use personal protective equipment, guards or safety devices
- ☐ Failure to use proper tools, equipment, or materials
- ☐ Other (describe):

Work Procedures

- ☐ Procedures are inadequate, missing, or not readily available
- ☐ Procedures not followed
- ☐ Other (describe):

Training

- ☐ Inadequate training
- ☐ Inadequate skill, qualification, or experience
- ☐ Other (describe):

Other

- ☐ Uncontrollable factor(s) (describe):

This category denotes factors that are outside Leidos control

CORRECTIVE ACTIONS

Identify actions that specifically address the causes identified above and that will effectively minimize the probability of similar events in the future. Actions must address root cause as well as contributing factors.

CAUSES (FROM ABOVE)	CORRECTIVE ACTION	PERSON ASSIGNED	DUE DATE	COMPLETION DATE

PART V	
PREPARER'S NAME: (PRINT)	**SUPERVISOR/MANAGER'S NAME: (PRINT)**
TITLE:	**TITLE:**
PREPARER'S SIGNATURE:	**SUPERVISOR/MANAGER'S SIGNATURE:**
DATE:	**DATE:**
DATE REVIEWED BY EH&S:	**EH&S SIGNATURE:**

ATTACHMENT B
SAFETY DATA SHEETS

THIS PAGE INTENTIONALLY LEFT BLANK.

Gasoline

THIS PAGE INTENTIONALLY LEFT BLANK.

AMERADA HESS CORPORATION

MATERIAL SAFETY DATA SHEET

Gasoline, All Grades **MSDS No. 9950**

EMERGENCY OVERVIEW
DANGER!
EXTREMELY FLAMMABLE - EYE AND MUCOUS MEMBRANE IRRITANT - EFFECTS CENTRAL NERVOUS SYSTEM - HARMFUL OR FATAL IF SWALLOWED - ASPIRATION HAZARD

NFPA 704 (Section 16)

High fire hazard. Keep away from heat, spark, open flame, and other ignition sources.

If ingested, do NOT induce vomiting, as this may cause chemical pneumonia (fluid in the lungs). Contact may cause eye, skin and mucous membrane irritation. Harmful if absorbed through the skin. Avoid prolonged breathing of vapors or mists. Inhalation may cause irritation, anesthetic effects (dizziness, nausea, headache, intoxication), and respiratory system effects.

Long-term exposure may cause effects to specific organs, such as to the liver, kidneys, blood, nervous system, and skin. Contains benzene, which can cause blood disease, including anemia and leukemia.

1. CHEMICAL PRODUCT and COMPANY INFORMATION (rev. Jan-04)

Amerada Hess Corporation
1 Hess Plaza
Woodbridge, NJ 07095-0961

EMERGENCY TELEPHONE NUMBER (24 hrs): **CHEMTREC (800)424-9300**
COMPANY CONTACT (business hours): Corporate Safety (732)750-6000
MSDS Internet Website www.hess.com/about/environ.html

SYNONYMS: Hess Conventional (Oxygenated and Non-oxygenated) Gasoline; Reformulated Gasoline (RFG); Reformulated Gasoline Blendstock for Oxygenate Blending (RBOB); Unleaded Motor or Automotive Gasoline

See Section 16 for abbreviations and acronyms.

2. COMPOSITION and INFORMATION ON INGREDIENTS * (rev. Jan-04)

INGREDIENT NAME (CAS No.)	CONCENTRATION PERCENT BY WEIGHT
Gasoline (86290-81-5)	100
Benzene (71-43-2)	0.1 - 4.9 (0.1 - 1.3 reformulated gasoline)
n-Butane (106-97-8)	< 10
Ethyl Alcohol (Ethanol) (64-17-5)	0 - 10
Ethyl benzene (100-41-4)	< 3
n-Hexane (110-54-3)	0.5 to 4
Methyl-tertiary butyl ether (MTBE) (1634-04-4)	0 to 15.0
Tertiary-amyl methyl ether (TAME) (994-05-8)	0 to 17.2
Toluene (108-88-3)	1 - 25
1,2,4- Trimethylbenzene (95-63-6)	< 6
Xylene, mixed isomers (1330-20-7)	1 - 15

A complex blend of petroleum-derived normal and branched-chain alkane, cycloalkane, alkene, and aromatic hydrocarbons. May contain antioxidant and multifunctional additives. Non-oxygenated Conventional Gasoline and RBOB do not have oxygenates (Ethanol or MTBE and/or TAME). Oxygenated Conventional and Reformulated Gasoline will have oxygenates for octane enhancement or as legally required.

3. HAZARDS IDENTIFICATION (rev. Dec-97)

EYES
Moderate irritant. Contact with liquid or vapor may cause irritation.

SKIN
Practically non-toxic if absorbed following acute (single) exposure. May cause skin irritation with prolonged or repeated contact. Liquid may be absorbed through the skin in toxic amounts if large areas of skin are exposed repeatedly.

INGESTION
The major health threat of ingestion occurs from the danger of aspiration (breathing) of liquid drops into the lungs, particularly from vomiting. Aspiration may result in chemical pneumonia (fluid in the lungs), severe lung damage, respiratory failure and even death.

Ingestion may cause gastrointestinal disturbances, including irritation, nausea, vomiting and diarrhea, and central nervous system (brain) effects similar to alcohol intoxication. In severe cases, tremors, convulsions, loss of consciousness, coma, respiratory arrest, and death may occur.

INHALATION
Excessive exposure may cause irritations to the nose, throat, lungs and respiratory tract. Central nervous system (brain) effects may include headache, dizziness, loss of balance and coordination, unconsciousness, coma, respiratory failure, and death.

WARNING: the burning of any hydrocarbon as a fuel in an area without adequate ventilation may result in hazardous levels of combustion products, including carbon monoxide, and inadequate oxygen levels, which may cause unconsciousness, suffocation, and death.

CHRONIC EFFECTS and CARCINOGENICITY
Contains benzene, a regulated human carcinogen. Benzene has the potential to cause anemia and other blood diseases, including leukemia, after repeated and prolonged exposure. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with systemic toxicity. See also Section 11 - Toxicological Information.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE
Irritation from skin exposure may aggravate existing open wounds, skin disorders, and dermatitis (rash). Chronic respiratory disease, liver or kidney dysfunction, or pre-existing central nervous system disorders may be aggravated by exposure.

4. FIRST AID MEASURES (rev. Dec-97)

EYES
In case of contact with eyes, immediately flush with clean, low-pressure water for at least 15 min. Hold eyelids open to ensure adequate flushing. Seek medical attention.

SKIN
Remove contaminated clothing. Wash contaminated areas thoroughly with soap and water or waterless hand cleanser. Obtain medical attention if irritation or redness develops.

INGESTION
DO NOT INDUCE VOMITING. Do not give liquids. Obtain immediate medical attention. If spontaneous vomiting occurs, lean victim forward to reduce the risk of aspiration. Small amounts of material which enter the mouth should be rinsed out until the taste is dissipated.

INHALATION
Remove person to fresh air. If person is not breathing, ensure an open airway and provide artificial respiration. If necessary, provide additional oxygen once breathing is restored if trained to do so. Seek medical attention immediately.

5. FIRE FIGHTING MEASURES (rev. Dec-97)

FLAMMABLE PROPERTIES:

FLASH POINT:	-45 °F (-43°C)
AUTOIGNITION TEMPERATURE:	highly variable; > 530 °F (>280 °C)
OSHA/NFPA FLAMMABILITY CLASS:	1A (flammable liquid)
LOWER EXPLOSIVE LIMIT (%):	1.4%
UPPER EXPLOSIVE LIMIT (%):	7.6%

FIRE AND EXPLOSION HAZARDS

Vapors may be ignited rapidly when exposed to heat, spark, open flame or other source of ignition. Flowing product may be ignited by self-generated static electricity. When mixed with air and exposed to an ignition source, flammable vapors can burn in the open or explode in confined spaces. Being heavier than air, vapors may travel long distances to an ignition source and flash back. Runoff to sewer may cause fire or explosion hazard.

EXTINGUISHING MEDIA

SMALL FIRES: Any extinguisher suitable for Class B fires, dry chemical, CO2, water spray, fire fighting foam, or Halon.

LARGE FIRES: Water spray, fog or fire fighting foam. Water may be ineffective for fighting the fire, but may be used to cool fire-exposed containers.

During certain times of the year and/or in certain geographical locations, gasoline may contain MTBE and/or TAME. Firefighting foam suitable for polar solvents is recommended for fuel with greater than 10% oxygenate concentration - refer to NFPA 11 “Low Expansion Foam - 1994 Edition.”

FIRE FIGHTING INSTRUCTIONS

Small fires in the incipient (beginning) stage may typically be extinguished using handheld portable fire extinguishers and other fire fighting equipment.

Firefighting activities that may result in potential exposure to high heat, smoke or toxic by-products of combustion should require NIOSH/MSHA- approved pressure-demand self-contained breathing apparatus with full facepiece and full protective clothing.

Isolate area around container involved in fire. Cool tanks, shells, and containers exposed to fire and excessive heat with water. For massive fires the use of unmanned hose holders or monitor nozzles may be advantageous to further minimize personnel exposure. Major fires may require withdrawal, allowing the tank to burn. Large storage tank fires typically require specially trained personnel and equipment to extinguish the fire, often including the need for properly applied fire fighting foam.

See Section 16 for the NFPA 704 Hazard Rating.

6. ACCIDENTAL RELEASE MEASURES (rev. Dec-97)

ACTIVATE FACILITY SPILL CONTINGENCY or EMERGENCY PLAN.

Evacuate nonessential personnel and remove or secure all ignition sources. Consider wind direction; stay upwind and uphill, if possible. Evaluate the direction of product travel, diking, sewers, etc. to confirm spill areas. Spills may infiltrate subsurface soil and groundwater; professional assistance may be necessary to determine the extent of subsurface impact.

Carefully contain and stop the source of the spill, if safe to do so. Protect bodies of water by diking, absorbents, or absorbent boom, if possible. Do not flush down sewer or drainage systems, unless system is designed and permitted to handle such material. The use of fire fighting foam may be useful in certain situations to reduce vapors. The proper use of water spray may effectively disperse product

vapors or the liquid itself, preventing contact with ignition sources or areas/equipment that require protection.

Take up with sand or other oil absorbing materials. Carefully shovel, scoop or sweep up into a waste container for reclamation or disposal - caution, flammable vapors may accumulate in closed containers. Response and clean-up crews must be properly trained and must utilize proper protective equipment (see Section 8).

7. HANDLING and STORAGE (rev. Dec-97)

HANDLING PRECAUTIONS

******USE ONLY AS A MOTOR FUEL******
******DO NOT SIPHON BY MOUTH******

Handle as a flammable liquid. Keep away from heat, sparks, and open flame! Electrical equipment should be approved for classified area. Bond and ground containers during product transfer to reduce the possibility of static-initiated fire or explosion.

Special slow load procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when higher flash point material (such as fuel oil) is loaded into tanks previously containing low flash point products (such as this product) - see API Publication 2003, "Protection Against Ignitions Arising Out Of Static, Lightning and Stray Currents.

STORAGE PRECAUTIONS

Keep away from flame, sparks, excessive temperatures and open flame. Use approved vented containers. Keep containers closed and clearly labeled. Empty product containers or vessels may contain explosive vapors. Do not pressurize, cut, heat, weld or expose such containers to sources of ignition.

Store in a well-ventilated area. This storage area should comply with NFPA 30 "Flammable and Combustible Liquid Code". Avoid storage near incompatible materials. The cleaning of tanks previously containing this product should follow API Recommended Practice (RP) 2013 "Cleaning Mobile Tanks In Flammable and Combustible Liquid Service" and API RP 2015 "Cleaning Petroleum Storage Tanks".

WORK/HYGIENIC PRACTICES

Emergency eye wash capability should be available in the near proximity to operations presenting a potential splash exposure. Use good personal hygiene practices. Avoid repeated and/or prolonged skin exposure. Wash hands before eating, drinking, smoking, or using toilet facilities. Do not use as a cleaning solvent on the skin. Do not use solvents or harsh abrasive skin cleaners for washing this product from exposed skin areas. Waterless hand cleaners are effective. Promptly remove contaminated clothing and launder before reuse. Use care when laundering to prevent the formation of flammable vapors which could ignite via washer or dryer. Consider the need to discard contaminated leather shoes and gloves.

8. EXPOSURE CONTROLS and PERSONAL PROTECTION (rev. Jan-04)

EXPOSURE LIMITS

Component (CAS No.)	Exposure Limits			
	Source	TWA (ppm)	STEL (ppm)	Note
Gasoline (86290-81-5)	ACGIH	300	500	A3
Benzene (71-43-2)	OSHA	1	5	Carcinogen
	ACGIH	0.5	2.5	A1, skin
	USCG	1	5	
n-Butane (106-97-8)	ACGIH	800	--	2003 NOIC: 1000 ppm (TWA) Aliphatic Hydrocarbon Gases Alkane (C1-C4)
Ethyl Alcohol (ethanol) (64-17-5)	OSHA	1000	--	
	ACGIH	1000	--	A4
Ethyl benzene (100-41-4)	OSHA	100	--	
	ACGIH	100	125	A3

Component (CAS No.)	Exposure Limits			
	Source	TWA (ppm)	STEL (ppm)	Note
n-Hexane (110-54-3)	OSHA	500	--	
	ACGIH	50	--	skin
Methyl-tertiary butyl ether [MTBE] (1634-04-4)	ACGIH	50		A3
Tertiary-amyl methyl ether [TAME] (994-05-8)				None established
Toluene (108-88-3)	OSHA	200		Ceiling: 300 ppm; Peak: 500 ppm (10 min.)
	ACGIH	50	--	A4 (skin)
1,2,4- Trimethylbenzene (95-63-6)	ACGIH	25	--	
Xylene, mixed isomers (1330-20-7)	OSHA	100	--	
	ACGIH	100	150	A4

ENGINEERING CONTROLS

Use adequate ventilation to keep vapor concentrations of this product below occupational exposure and flammability limits, particularly in confined spaces.

EYE/FACE PROTECTION

Safety glasses or goggles are recommended where there is a possibility of splashing or spraying.

SKIN PROTECTION

Gloves constructed of nitrile or neoprene are recommended. Chemical protective clothing such as that made of of E.I. DuPont Tychem ®, products or equivalent is recommended based on degree of exposure.

Note: The resistance of specific material may vary from product to product as well as with degree of exposure. Consult manufacturer specifications for further information.

RESPIRATORY PROTECTION

A NIOSH-approved air-purifying respirator with organic vapor cartridges or canister may be permissible under certain circumstances where airborne concentrations are or may be expected to exceed exposure limits or for odor or irritation. Protection provided by air-purifying respirators is limited. Refer to OSHA 29 CFR 1910.134, NIOSH Respirator Decision Logic, and the manufacturer for additional guidance on respiratory protection selection and limitations.

Use a positive pressure, air-supplied respirator if there is a potential for uncontrolled release, exposure levels are not known, in oxygen-deficient atmospheres, or any other circumstance where an air-purifying respirator may not provide adequate protection.

9. PHYSICAL and CHEMICAL PROPERTIES (rev. Jan-04)

APPEARANCE

A translucent, straw-colored or light yellow liquid

ODOR

A strong, characteristic aromatic hydrocarbon odor. Oxygenated gasoline with MTBE and/or TAME may have a sweet, ether-like odor and is detectable at a lower concentration than non-oxygenated gasoline.

ODOR THRESHOLD

	Odor Detection	Odor Recognition
Non-oxygenated gasoline:	0.5 - 0.6 ppm	0.8 - 1.1 ppm
Gasoline with 15% MTBE:	0.2 - 0.3 ppm	0.4 - 0.7 ppm
Gasoline with 15% TAME:	0.1 ppm	0.2 ppm

BASIC PHYSICAL PROPERTIES

BOILING RANGE:	85 to 437 °F (39 to 200 °C)
VAPOR PRESSURE:	6.4 - 15 RVP @ 100 °F (38 °C) (275-475 mm Hg @ 68 °F (20 °C)
VAPOR DENSITY (air = 1):	AP 3 to 4
SPECIFIC GRAVITY (H_2O = 1):	0.70 – 0.78
EVAPORATION RATE:	10-11 (n-butyl acetate = 1)
PERCENT VOLATILES:	100 %

SOLUBILITY (H_2O): Non-oxygenated gasoline - negligible (< 0.1% @ 77 °F). Gasoline with 15% MTBE - slight (0.1 - 3% @ 77 °F); ethanol is readily soluble in water

10. STABILITY and REACTIVITY (rev. Dec-94)

STABILITY: Stable. Hazardous polymerization will not occur.

CONDITIONS TO AVOID

Avoid high temperatures, open flames, sparks, welding, smoking and other ignition sources

INCOMPATIBLE MATERIALS

Keep away from strong oxidizers.

HAZARDOUS DECOMPOSITION PRODUCTS

Carbon monoxide, carbon dioxide and non-combusted hydrocarbons (smoke). Contact with nitric and sulfuric acids will form nitrocresols that can decompose violently.

11. TOXICOLOGICAL PROPERTIES (rev. Dec-97)

ACUTE TOXICITY

Acute Dermal LD50 (rabbits): > 5 ml/kg
Acute Oral LD50 (rat): 18.75 ml/kg
Primary dermal irritation (rabbits): slightly irritating
Draize eye irritation (rabbits): non-irritating
Guinea pig sensitization: negative

CHRONIC EFFECTS AND CARCINOGENICITY

Carcinogenicity: OSHA: NO IARC: YES - 2B NTP: NO ACGIH: YES (A3)

IARC has determined that gasoline and gasoline exhaust are possibly carcinogenic in humans. Inhalation exposure to completely vaporized unleaded gasoline caused kidney cancers in male rats and liver tumors in female mice. The U.S. EPA has determined that the male kidney tumors are species-specific and are irrelevant for human health risk assessment. The significance of the tumors seen in female mice is not known. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with effects to the central and peripheral nervous systems, liver, and kidneys. The significance of these animal models to predict similar human response to gasoline is uncertain.

This product contains benzene. Human health studies indicate that prolonged and/or repeated overexposure to benzene may cause damage to the blood-forming system (particularly bone marrow), and serious blood disorders such as aplastic anemia and leukemia. Benzene is listed as a human carcinogen by the NTP, IARC, OSHA and ACGIH.

This product may contain methyl tertiary butyl ether (MTBE): animal and human health effects studies indicate that MTBE may cause eye, skin, and respiratory tract irritation, central nervous system depression and neurotoxicity. MTBE is classified as an animal carcinogen (A3) by the ACGIH.

12. ECOLOGICAL INFORMATION (rev. Jan-04)

Keep out of sewers, drainage areas and waterways. Report spills and releases, as applicable, under Federal and State regulations. If released, oxygenates such as ethers and alcohols will be expected to exhibit fairly high mobility in soil, and therefore may leach into groundwater. The API (www.api.org) provides a number of useful references addressing petroleum and oxygenate contamination of groundwater.

13. DISPOSAL CONSIDERATIONS (rev. Dec-97)

Consult federal, state and local waste regulations to determine appropriate disposal options.

14. TRANSPORTATION INFORMATION (rev. Jan-04)

DOT PROPER SHIPPING NAME:	Gasoline
DOT HAZARD CLASS and PACKING GROUP:	3, PG II
DOT IDENTIFICATION NUMBER:	UN 1203
DOT SHIPPING LABEL:	FLAMMABLE LIQUID

PLACARD:

15. REGULATORY INFORMATION (rev. Jan-04)

U.S. FEDERAL, STATE, and LOCAL REGULATORY INFORMATION

This product and its constituents listed herein are on the EPA TSCA Inventory. Any spill or uncontrolled release of this product, including any substantial threat of release, may be subject to federal, state and/or local reporting requirements. This product and/or its constituents may also be subject to other federal, state, or local regulations; consult those regulations applicable to your facility/operation.

CLEAN WATER ACT (OIL SPILLS)

Any spill or release of this product to "navigable waters" (essentially any surface water, including certain wetlands) or adjoining shorelines sufficient to cause a visible sheen or deposit of a sludge or emulsion must be reported immediately to the National Response Center (1-800-424-8802) or, if not practical, the U.S. Coast Guard with follow-up to the National Response Center, as required by U.S. Federal Law. Also contact appropriate state and local regulatory agencies as required.

CERCLA SECTION 103 and SARA SECTION 304 (RELEASE TO THE ENVIRONMENT)

The CERCLA definition of hazardous substances contains a “petroleum exclusion” clause which exempts crude oil, refined, and unrefined petroleum products and any indigenous components of such. However, other federal reporting requirements (e.g., SARA Section 304 as well as the Clean Water Act if the spill occurs on navigable waters) may still apply.

SARA SECTION 311/312 - HAZARD CLASSES

ACUTE HEALTH	CHRONIC HEALTH	FIRE	SUDDEN RELEASE OF PRESSURE	REACTIVE
X	X	X	--	--

SARA SECTION 313 - SUPPLIER NOTIFICATION

This product contains the following toxic chemicals subject to the reporting requirements of section 313 of the Emergency Planning and Community Right-To-Know Act (EPCRA) of 1986 and of 40 CFR 372:

INGREDIENT NAME (CAS NUMBER)	CONCENTRATION WT. PERCENT
Benzene (71-43-2)	0.1 to 4.9 (0.1 to 1.3 for reformulated gasoline)
Ethyl benzene (100-41-4)	< 3
n-Hexane (110-54-3)	0.5 to 4
Methyl-tertiary butyl ether (MTBE) (1634-04-4)	0 to 15.0
Toluene (108-88-3)	1 to 15
1,2,4- Trimethylbenzene (95-63-6)	< 6
Xylene, mixed isomers (1330-20-7)	1 to 15

US EPA guidance documents (www.epa.gov/tri) for reporting Persistent Bioaccumulating Toxics (PBTs) indicate this product may contain the following deminimis levels of toxic chemicals subject to Section 313 reporting:

INGREDIENT NAME (CAS NUMBER)	CONCENTRATION - Parts per million (ppm) by weight
Polycyclic aromatic compounds (PACs)	17
Benzo (g,h,i) perylene (191-24-2)	2.55
Lead (7439-92-1)	0.079

CANADIAN REGULATORY INFORMATION (WHMIS)

Class B, Division 2 (Flammable Liquid)

Class D, Division 2A (Very toxic by other means) and Class D, Division 2B (Toxic by other means)

16. OTHER INFORMATION (rev. Jan-04)

DISCLAIMER OF EXPRESSED AND IMPLIED WARRANTIES

Information presented herein has been compiled from sources considered to be dependable, and is accurate and reliable to the best of our knowledge and belief, but is not guaranteed to be so. Since conditions of use are beyond our control, we make no warranties, expressed or implied, except those that may be contained in our written contract of sale or acknowledgment.

Vendor assumes no responsibility for injury to vendee or third persons proximately caused by the material if reasonable safety procedures are not adhered to as stipulated in the data sheet. Additionally, vendor assumes no responsibility for injury to vendee or third persons proximately caused by abnormal use of the material, even if reasonable safety procedures are followed. Furthermore, vendee assumes the risk in their use of the material.

Trizma (preservative)

THIS PAGE INTENTIONALLY LEFT BLANK.

1. PRODUCT AND COMPANY IDENTIFICATION

1.1 Product identifiers

Product name : Trizma® Pre-set crystals

CAS Number : 77-86-1

1.2 Relevant identified uses of the substance or mixture and uses advised against

Identified uses : Laboratory chemicals, Manufacture of substances

1.3 Details of the supplier of the safety data sheet

Company : Quality Environmental Containers, Inc.
607 Industrial Park Rd • PO Box 1160
Beaver, WV 25813

Telephone : +1 800-255-3950

1.4 Emergency telephone number

Emergency Phone # : Chemtrec: (800) 424-9300

2. HAZARDS IDENTIFICATION

2.1 Classification of the substance or mixture

GHS Classification in accordance with 29 CFR 1910 (OSHA HCS)
Skin irritation (Category 2), H315
Eye irritation (Category 2A), H319
Specific target organ toxicity - single exposure (Category 3), Respiratory system, H335

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS Label elements, including precautionary statements

Pictogram

Signal word Warning

Hazard statement(s)

H315	Causes skin irritation.
H319	Causes serious eye irritation.
H335	May cause respiratory irritation.

Precautionary statement(s)

P261	Avoid breathing dust/ fume/ gas/ mist/ vapours/ spray.
P264	Wash skin thoroughly after handling.
P271	Use only outdoors or in a well-ventilated area.
P280	Wear protective gloves/ eye protection/ face protection.
P302 + P352	IF ON SKIN: Wash with plenty of soap and water.
P304 + P340	IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

P312	Call a POISON CENTER or doctor/ physician if you feel unwell.
P321	Specific treatment (see supplemental first aid instructions on this label).
P332 + P313	If skin irritation occurs: Get medical advice/ attention.
P337 + P313	If eye irritation persists: Get medical advice/ attention.
P362	Take off contaminated clothing and wash before reuse.
P403 + P233	Store in a well-ventilated place. Keep container tightly closed.
P405	Store locked up.
P501	Dispose of contents/ container to an approved waste disposal plant.

2.3 Hazards not otherwise classified (HNOC) or not covered by GHS - none

3. COMPOSITION/INFORMATION ON INGREDIENTS

3.2 Mixtures

Synonyms : Tris crystals

Hazardous components

Component		Classification	Concentration
Tris (hydroxymethyl) aminomethane			
CAS-No.	77-86-1		30 - 60 %
EC-No.	201-064-4		
Registration number	01-2119957659-16-XXXX		

For the full text of the H-Statements mentioned in this Section, see Section 16.

4. FIRST AID MEASURES

4.1 Description of first aid measures

General advice
Consult a physician. Show this safety data sheet to the doctor in attendance.Move out of dangerous area.

If inhaled
If breathed in, move person into fresh air. If not breathing, give artificial respiration. Consult a physician.

In case of skin contact
Wash off with soap and plenty of water. Consult a physician.

In case of eye contact
Rinse thoroughly with plenty of water for at least 15 minutes and consult a physician.

If swallowed
Never give anything by mouth to an unconscious person. Rinse mouth with water. Consult a physician.

4.2 Most important symptoms and effects, both acute and delayed
The most important known symptoms and effects are described in the labelling (see section 2.2) and/or in section 11

4.3 Indication of any immediate medical attention and special treatment needed
no data available

5. FIREFIGHTING MEASURES

5.1 Extinguishing media

Suitable extinguishing media
Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture
Carbon oxides, nitrogen oxides (NOx), Hydrogen chloride gas

5.3 Advice for firefighters
Wear self contained breathing apparatus for fire fighting if necessary.

5.4 Further information
no data available

6. ACCIDENTAL RELEASE MEASURES

6.1 Personal precautions, protective equipment and emergency procedures
Use personal protective equipment. Avoid dust formation. Avoid breathing vapours, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust.
For personal protection see section 8.

6.2 Environmental precautions
Do not let product enter drains.

6.3 Methods and materials for containment and cleaning up
Pick up and arrange disposal without creating dust. Sweep up and shovel. Keep in suitable, closed containers for disposal.

6.4 Reference to other sections
For disposal see section 13.

7. HANDLING AND STORAGE

7.1 Precautions for safe handling
Avoid contact with skin and eyes. Avoid formation of dust and aerosols.
Provide appropriate exhaust ventilation at places where dust is formed.
For precautions see section 2.2.

7.2 Conditions for safe storage, including any incompatibilities
Keep container tightly closed in a dry and well-ventilated place.

7.3 Specific end use(s)
Apart from the uses mentioned in section 1.2 no other specific uses are stipulated

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1 Control parameters

Components with workplace control parameters
Contains no substances with occupational exposure limit values.

8.2 Exposure controls

Appropriate engineering controls
Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection
Safety glasses with side-shields conforming to EN166 Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection
Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching glove's outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection
impervious clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection
For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator.For higher level protection use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Control of environmental exposure
Do not let product enter drains.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1 Information on basic physical and chemical properties

a)	Appearance	Form: solid
b)	Odour	no data available
c)	Odour Threshold	no data available
d)	pH	7.0 - 9.1
e)	Melting point/freezing point	no data available
f)	Initial boiling point and boiling range	no data available
g)	Flash point	no data available
h)	Evapouration rate	no data available
i)	Flammability (solid, gas)	no data available
j)	Upper/lower flammability or explosive limits	no data available
k)	Vapour pressure	no data available
l)	Vapour density	no data available
m)	Relative density	no data available
n)	Water solubility	no data available
o)	Partition coefficient: n-octanol/water	no data available
p)	Auto-ignition temperature	no data available
q)	Decomposition temperature	no data available
r)	Viscosity	no data available
s)	Explosive properties	no data available
t)	Oxidizing properties	no data available

9.2 Other safety information

no data available

10. STABILITY AND REACTIVITY

10.1 Reactivity

no data available

10.2 Chemical stability

Stable under recommended storage conditions.

10.3 Possibility of hazardous reactions

no data available

10.4 Conditions to avoid

no data available

10.5 Incompatible materials

Bases, Oxidizing agents, Strong oxidizing agents

10.6 Hazardous decomposition products

Other decomposition products - no data available
In the event of fire: see section 5

11. TOXICOLOGICAL INFORMATION

11.1 Information on toxicological effects

Acute toxicity
no data available

Inhalation: no data available

Dermal: no data available

no data available

Skin corrosion/irritation
no data available

Serious eye damage/eye irritation
no data available

Respiratory or skin sensitisation
no data available

Germ cell mutagenicity
no data available

Carcinogenicity

IARC: No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

ACGIH: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by ACGIH.

NTP: No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

OSHA: No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

Reproductive toxicity
no data available
no data available

Specific target organ toxicity - single exposure
no data available

Specific target organ toxicity - repeated exposure
no data available

Aspiration hazard
no data available

Additional Information
RTECS: Not available

To the best of our knowledge, the chemical, physical, and toxicological properties have not been thoroughly investigated.

12. ECOLOGICAL INFORMATION

12.1 Toxicity
no data available

12.2 Persistence and degradability
no data available

12.3 Bioaccumulative potential
no data available

12.4 Mobility in soil
no data available

12.5 Results of PBT and vPvB assessment
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted

12.6 Other adverse effects
no data available

13. DISPOSAL CONSIDERATIONS

13.1 Waste treatment methods

Product
Offer surplus and non-recyclable solutions to a licensed disposal company. Contact a licensed professional waste disposal service to dispose of this material.

Contaminated packaging
Dispose of as unused product.

14. TRANSPORT INFORMATION

DOT (US)
Not dangerous goods

IMDG
Not dangerous goods

IATA
Not dangerous goods

15. REGULATORY INFORMATION

SARA 302 Components
SARA 302: No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

SARA 313 Components
SARA 313: This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

SARA 311/312 Hazards
Acute Health Hazard

Massachusetts Right To Know Components
No components are subject to the Massachusetts Right to Know Act.

Isobutylene Calibration Gas

THIS PAGE INTENTIONALLY LEFT BLANK.

GASCO

MATERIAL SAFETY DATA SHEET - CALIBRATION CHECK GAS

PRODUCT NAME: ISOBUTYLENE (1 PPM – 0.9%) IN AIR

MSDS NO: 248 **Version:3** **Date: March, 2012**

1. Chemical Product and Company Identification

Gasco Affiliates, LLC
320 Scarlett Blvd.
Oldsmar, FL 34677

TELEPHONE NUMBER: (800) 910-0051 **24-HOUR EMERGENCY NUMBER: 1-800-424-9300**
FAX NUMBER: (866) 755-8920
E-MAIL: info@gascogas.com

PRODUCT NAME: ISOBUTYLENE (1 PPM – 0.9%) IN AIR
CHEMICAL NAME: Isobutylene in air
COMMON NAMES/ SYNONYMS: None
TDG (Canada) CLASSIFICATION: 2.2
WHIMIS CLASSIFICATION: A

2. COMPOSITION/ INFORMATION ON INGREDIENTS

INGREDIENT	%VOLUME	PEL-OSHA	TLV-ACGIH	LD_{50} or LC_{50} Route/Species
Isobutylene FORMULA: C_4H_8	0.0001-0.9	N/A	N/A	N/A
Air FORMULA: Mixture	99.0 to 99.9999	N/A	N/A	N/A

3. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Release of this product may produce oxygen-deficient atmospheres (especially in confined spaces or other poorly ventilated environments); individuals in such atmospheres may be asphyxiated. Isobutylene may cause drowsiness and other central nervous system effects in high concentrations; however, due to the low concentration of this gas mixture, this is unlikely to occur.

ROUTE OF ENTRY:

Skin Contact	Skin Absorption	Eye Contact	Inhalation	Ingestion
No	No	No	Yes	No

HEALTH EFFECTS:

Exposure Limits	Irritant	Sensitization	Reproductive Hazard	Mutagen
Yes	No	No	No	No

Carcinogenicity: --NTP: No IARC: No OSHA: No

EYE EFFECTS:
N/A.

SKIN EFFECTS:
N/A.

PRODUCT NAME: ISOBUTYLENE (1 PPM – 0.9%) IN AIR

INGESTION EFFECTS:
Ingestion unlikely. Gas at room temperature.

INHALATION EFFECTS:
Due to the small size of this cylinder, no unusual health effects from over-exposure are anticipated under normal routine use.

NFPA HAZARD CODES		HMIS HAZARD CODES		RATING SYSTEM
Health:	1	Health:	1	0= No Hazard
Flammability:	0	Flammability:	0	1= Slight Hazard
Reactivity:	0	Reactivity:	0	2= Moderate Hazard
				3= Serious Hazard
				4= Severe Hazard

4. FIRST AID MEASURES

EYES:
N/A

SKIN:
N/A

INGESTION:
Not required

INHALATION:
PROMPT MEDICAL ATTENTION IS MANDATORY IN ALL CASED OF OVEREXPOSURE. RESCUE PERSONNEL SHOULD BE EQUIPPED THE SELF-CONTAINED BREATHING APPARATUS. Victims should be assisted to an uncontaminated area and inhale fresh air. Quick removal from the contaminated area is most important. If breathing has stopped administer artificial resuscitation and supplemental oxygen. Further treatment should be symptomatic and supportive.

5. FIRE-FIGHTING MEASURES

These containers hold gas under pressure, with no liquid phase. If involved in a major fire, they should be sprayed with water to avoid pressure increases, otherwise pressures will rise and ultimately they may distort or burst to release the contents. The gases will not add significantly to the fire, but containers or fragments may be projected considerable distances - thereby hampering fire fighting efforts.

6. ACCIDENTAL RELEASE MEASURES

In terms of weight, these containers hold very little contents, such that any accidental release by puncturing etc. will be of no practical concern.

7. HANDLING AND STORAGE

Suck back of water into the container must be prevented. Do not allow backfeed into the container. Use only properly specified equipment which is suitable for this product, its supply pressure and temperature. Use only in well-ventilated areas. Do not heat cylinder by any means to increase rate of product from the cylinder. Do not allow the temperature where cylinders are stored to exceed 130°F (54°C).

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Use adequate ventilation for extended use of gas.

PRODUCT NAME: ISOBUTYLENE (1 PPM – 0.9%) IN AIR

9. PHYSICAL AND CHEMICAL PROPERTIES

PARAMETER:	VALUE:
Physical state	: Gas
Evaporation point	: N/A
pH	: N/A
Odor and appearance	: Colorless, odorless gas

10. STABILITY AND REACTIVITY

Stable under normal conditions. Expected shelf life 48 months.

11. TOXICOLOGICAL INFORMATION

No toxicological damage caused by this product.

12. ECOLOGICAL INFORMATION

No ecological damage caused by this product.

13. DISPOSAL INFORMATION

Do not discharge into any place where its accumulation could be dangerous. Used containers are acceptable for disposal in the normal waste stream as long as the cylinder is empty and valve removed or cylinder wall is punctured; but GASCO encourages the consumer to return cylinders.

14. TRANSPORT INFORMATION

	United States DOT	Canada TDG
PROPER SHIPPING NAME:	Compressed Gas N.O.S. (Isobutylene in Air)	Compressed Gas N.O.S. (Isobutylene in Air)
HAZARD CLASS:	2.2	2.2
IDENTIFICATION NUMBER:	UN1956	UN1956
SHIPPING LABEL:	NONFLAMMABLE GAS	NONFLAMMABLE GAS

15. REGULATORY INFORMATION

Isobutylene is listed under the accident prevention provisions of section 112(r) of the Clean Air Act (CAA) with a threshold quantity (TQ) of 10,000 pounds.

16. OTHER INFORMATION

This MSDS has been prepared in accordance with the Chemicals (Hazard Information and Packaging for Supply (Amendment) Regulation 1996. The information is based on the best knowledge of GASCO, and its advisors and is given in good faith, but we cannot guarantee its accuracy, reliability or completeness and therefore disclaim any liability for loss or damage arising out of use of this data. Since conditions of use are outside the control of the Company and its advisors we disclaim any liability for loss or damage when the product is used for other purposes than it is intended.

Suite 309
White Plains, NY 10603.

Manufacturer emergency phone number: 800-255-3924.
813-248-0585 (outside of the United States).

Manufacturer: Alconox, Inc.
30 Glenn St.
Suite 309
White Plains, NY 10603.

Supplier MSDS date: 2005/02/24

D.O.T. Classification: Not regulated.

Section 2 : HAZARDOUS INGREDIENTS

C.A.S.	CONCENTRATION %	Ingredient Name	T.L.V.	LD/50	LC/50
25155-30-0	10-30	SODIUM DODECYLBENZENESULFONATE	NOT AVAILABLE	438 MG/KG RAT ORAL 1330 MG/KG MOUSE ORAL	NOT AVAILABLE

Section 3 : PHYSICAL / CHEMICAL CHARACTERISTICS

Physical state: Liquid.

Appearance & odor: Odourless.
Pale yellow.

Odor threshold (ppm): Not available.

Vapour pressure (mmHg): @ 20°C (68°F).
17

Vapour density (air=1): >1

Volatiles (%)

By volume: Not available.

Evaporation rate (butyl acetate = 1): < 1.

Boiling point (°C):	100 (212F)
Freezing point (°C):	Not available.
pH:	8.5
Specific gravity @ 20 °C:	(water = 1). 1.083
Solubility in water (%):	Complete.
Coefficient of water\oil dist.:	Not available.
VOC:	None

Section 4 : FIRE AND EXPLOSION HAZARD DATA

Flammability:	Not flammable.
Conditions of flammability:	Surrounding fire.
Extinguishing media:	Carbon dioxide, dry chemical, foam. Water Water fog.
Special procedures:	Self-contained breathing apparatus required. Firefighters should wear the usual protective gear. Use water spray to cool fire exposed containers.
Auto-ignition temperature:	Not available.
Flash point (°C), method:	None
Lower flammability limit (% vol):	Not applicable.
Upper flammability limit (% vol):	Not applicable.

Not available.

Sensitivity to mechanical impact:	Not available.
Hazardous combustion products:	Oxides of carbon (COx). Hydrocarbons.
Rate of burning:	Not available.
Explosive power:	Containers may rupture if exposed to heat or fire.

Section 5 : REACTIVITY DATA

Chemical stability:	Product is stable under normal handling and storage conditions.
Conditions of instability:	Extreme temperatures.
Hazardous polymerization:	Will not occur.
Incompatible substances:	Strong acids. Strong oxidizing agents.
Hazardous decomposition products:	See hazardous combustion products.

Section 6 : HEALTH HAZARD DATA

Route of entry: Skin contact, eye contact, inhalation and ingestion.

Effects of Acute Exposure

Eye contact: May cause irritation.

Skin contact: Prolonged and repeated contact may cause irritation.

Inhalation: May cause headache and nausea.

Ingestion: May cause vomiting and diarrhea.
May cause gastric distress.

Effects of chronic exposure: See effects of acute exposure.

LD50 of product, species & route: > 5000 mg/kg rat oral.

LC50 of product, species & route: Not available.

Exposure limit of material: Not available.

Sensitization to product: Not available.

Carcinogenic effects: Not listed as a carcinogen.

Reproductive effects: Not available.

Teratogenicity: Not available.

Mutagenicity: Not available.

Synergistic materials: Not available.

Medical conditions aggravated by exposure: Not available.

First Aid

Skin contact: Remove contaminated clothing.
Wash thoroughly with soap and water.
Seek medical attention if irritation persists.

Eye contact: Check for and remove contact lenses.
Flush eyes with clear, running water for 15 minutes while holding eyelids open: if irritation persists, consult a physician.

Inhalation: Remove victim to fresh air.
If irritation persists, seek medical attention.

Ingestion: Do not induce vomiting, seek medical attention.
Dilute with two glasses of water.
Never give anything by mouth to an unconscious person.

Section 7 : PRECAUTIONS FOR SAFE HANDLING AND USE

Leak/Spill: Contain the spill.
Prevent entry into drains, sewers, and other waterways.
Wear appropriate protective equipment.
Small amounts may be flushed to sewer with water.
Soak up with an absorbent material.
Place in appropriate container for disposal.
Notify the appropriate authorities as required.

Waste disposal: In accordance with local and federal regulations.

Handling procedures and equipment: Protect against physical damage.
Avoid breathing vapors/mists.
Wear personal protective equipment appropriate to task.

Wash thoroughly after handling.
Keep out of reach of children.
Avoid contact with skin, eyes and clothing.
Avoid extreme temperatures.
Launder contaminated clothing prior to reuse.

Storage requirements: Store away from incompatible materials.
Keep containers closed when not in use.

Section 8 : CONTROL MEASURES

Precautionary Measures

Gloves/Type:

Wear appropriate gloves.

Respiratory/Type: None required under normal use.

Eye/Type:

Safety glasses recommended.

Footwear/Type: Safety shoes per local regulations.

Clothing/Type: As required to prevent skin contact.

Other/Type: Eye wash facility should be in close proximity.
Emergency shower should be in close proximity.

Ventilation requirements: Local exhaust at points of emission.

MEMORANDUM – TESTING FOR PERFLUOROCHEMICALS (PFOS/PFOA) IN DRINKING WATER (NAVY 2015)

THIS PAGE INTENTIONALLY LEFT BLANK.

DEPARTMENT OF THE NAVY
BUREAU OF MEDICINE AND SURGERY
7700 ARLINGTON BOULEVARD
FALLS CHURCH, VA 22042

IN REPLY REFER TO
6280
Ser M3B7/15UM30462
DEC 2 4 2015

MEMORANDUM FOR COMMANDER, NAVY MEDICINE EAST
COMMANDER, NAVY MEDICINE WEST

Subj: TESTING FOR PERFLUOROCHEMICALS (PFCs) IN DRINKING WATER

Ref: (a) BUMEDINST 6240.10B, Water Quality Standards

Encl: (1) OPNAV ltr 5090 N45 Ser/15U132432 of 14 Sep 2015, Navy Drinking Water Sampling Policy for Perfluorochemicals Perfluorooctane Sulfonate and Perfluorooctanoic Acid
(2) Marine Corps Memo of 24 Dec 2014, Sampling and Testing for Perfluorinated Compounds (PFCs) in Drinking Water
(3) Additional Resources and Communication Tools

1. The Navy and Marine Corps have begun testing for PFCs in drinking water systems at certain installations per enclosures (1) and (2). The specific PFCs for which testing is being performed are perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA).

2. Background. PFOS and PFOA are man-made chemicals that are of increasing concern to the United States (U.S.) Environmental Protection Agency (EPA) and state regulators. They have been used in fire extinguishing foam, waterproof fabrics, non-stick cookware, stain resistant carpets, and other products. These substances are very stable and persistent in the environment; they can migrate to drinking water sources because they are not adsorbed well in soil. These substances are considered "emerging contaminants" for which there are no Safe Drinking Water Act (SDWA) regulatory standards (e.g., Maximum Contaminant Levels (MCLs)).

a. The EPA developed Provisional Health Advisory (PHA) values for PFOA and PFOA. They reflect health-based concentrations above which action should be taken to reduce exposure to these unregulated contaminants in drinking water. The EPA PHA for PFOS is 0.2 micrograms per liter (µg/L), and the PHA for PFOA is 0.4 µg/L.

b. In 2012, the EPA added a requirement to sample for PFOS/PFOA by the end of 2015 under the SDWA Third Unregulated Contaminant Monitoring Rule. This was intended to identify the extent of PFOS/PFOA in U.S. drinking water systems and help the EPA determine whether a drinking water standard should be established. Based on sampling conducted throughout the Department of Defense to date, we do not expect a significant number of samples to exceed the EPA PHAs for PFOS or PFOA.

c. Per enclosure (1), if a PFOS or PFOA sample exceeds the EPA PHA at any Navy drinking water system, consultation with the Navy and Marine Corps Public Health Center (NMCPHC) should be initiated to determine allowable uses for the water in accordance with reference (a).

3. Action. In preparation for addressing potentially high PFOS/PFOA sampling results, Navy Medicine Regions and medical treatment facilities (MTFs) must take the following steps:

a. Ahead of drinking water sampling, Regions must ensure each MTF identifies a point of contact (POC) who is knowledgeable of this program, is experienced in risk communication, and can answer questions regarding health risks and the significance of testing results. The POC should generally be a specialist in public health, occupational medicine, or environmental health. The POC should coordinate with the regional or installation Drinking Water Manager prior to initiation of sampling and testing. Navy Medicine Regions should also identify a regional POC if they have not already done so.

b. If PFOS or PFOA sampling results are above the EPA PHA, then MTFs should anticipate medical inquiries and use appropriate risk communication practices. The medical POCs should also prepare to visit the affected facilities to address any concerns. These visits should be done in coordination with installation staff, who will then deliver notification letters with sampling results to affected individuals.

(1) The medical POCs should be prepared to discuss the potential health risks due to PFOS/PFOA exposure, reasons why PFOS/PFOA blood testing is not recommended, as well as when and how to obtain a medical evaluation.

(2) The medical POCs can find additional resources and communication tools in enclosure (3).

4. Blood testing for PFOS/PFOA is not medically necessary. While blood tests can measure the level of PFCs in a person's body at the time of the test, the blood tests cannot:

(1) tell a person where or how they were exposed to PFCs, since there are many other sources of PFC exposure in a person's living and working environment;

(2) tell a person what, if any, health problems might occur or have occurred because of PFC exposure;

(3) be used by a health care provider to guide individual treatment decisions or additional medical tests. There are no medically approved "treatments" or methods to remove PFCs from a person's body other than to decrease total exposure in order to reduce body burden over time.

Healthcare providers should perform any routine diagnostic or screening tests as medically indicated based on their patient's history, physical examination, and assessment, but not based on PFOS/PFOA levels.

5. The NMCPHC will provide further information and support. They may be reached by phone at (757) 953-0700 or DSN (312) 377- 0700.

6. My point of contact is LCDR Jaime Vega, MC, USN, Occupational Medicine, who may be reached via phone at (703) 681-5467 or by email at Jaime.Vega2.mil@mail.mil.

Subj: NAVY DRINKING WATER SAMPLING POLICY FOR PERFLUOROCHEMICALS PERFLUOROOCTANE SULFONATE AND PERFLUOROOCATONOIC ACID

Ref: (a) CNICINST 5090.3
(b) EPA Office of Water Provisional Health Advisories for Perfluorooctanoic Acid (PFOA) and Perfluorooctane Sulfonate (PFOS) dated January 8, 2009
(c) BUMEDINST 6240.1B

Encl: (1) 21 October 2014 ASN (EI&E) Memo
(2) EPA Approved Laboratories for UCMR 3
(3) Field Sampling Protocols to Avoid Cross Contamination

1. Effective the date of this letter, this policy supports enclosure (1) in providing requirements for sampling and testing for the emerging contaminants Perfluorooctane Sulfonate (PFOS) and Perfluoroocatanoic Acid (PFOA) in certain Navy public water systems (PWS) in the United States and Navy overseas drinking water (ODW) systems as defined in reference (a).

2. Backgroud. PFOS and PFOA are perfluorochemicals (PFCs), man-made chemicals that are of increasing concern to the U.S. Environmental Protection Agency (EPA) and state regulators. These substances are very stable and persistent in the environment and because they are not adsorbed well in soil, they can migrate to drinking water sources. At present, these substances are considered "emerging contaminants" for which there are no Safe Drinking Water Act (SDWA) regulatory standards. While PFCs have been used in a variety of products and substances, the most common historical Navy use of the substances has been as a fire extinguishing surfactant in Aqueous Film-Forming Foam (AFFF).

3. In 2012, EPA added a requirement to sample for PFOS/PFOA under the SDWA Third Unregulated Contaminant Monitoring Rule (UCMR 3). As a result, all large and 800 small public water systems (PWS) in the United States must sample and test for these chemicals between 2013 and 2015. The purpose of UCMR 3 sampling and testing is to determine the extent that PFOS/PFOA occurs in U.S. drinking water systems and whether drinking water standards should be established.

4. On 8 January 2009, EPA's Office of Water released a Provisional Health Advisory (PHA) establishing health-based screening levels for PFOS and PFOA. Reference (b) sets the PHA for PFOS at 0.2 micrograms per liter (μg/L); the PHA for PFOA was set at 0.4 μg/L. The 2009 PHA is under review, and if EPA revises the levels, the revised figures will be used for all Navy PFOS/PFOA actions unless the U.S. state in which the installation is located has established more stringent standards.

5. Policy. This letter establishes policy for the sampling and testing of PFOS and PFOA in drinking water at certain Navy installations worldwide. When federal, state, or DoD standards are promulgated, the more protective requirement will be used for Navy PFOS and PFOA actions.

6. All Navy PWSs in the United States that produce drinking water from on installation sources where PFCs are known or suspected to have been released within approximately 1-mile up-gradient to the drinking water source must sample and test for PFOS/PFOA in finished drinking water. Navy PWSs that have completed sampling and testing for PFOS/PFOA under the Federal UCMR 3 or any state UCMR that has requirements at least as stringent as Federal requirements are not required to repeat sampling and testing for the purpose of this policy. All ODW Systems must also sample and test for PFOS/PFOA in finished drinking water, unless the installation can document that there is no potential PFOS/PFOA exposure pathway.

7. Drinking water managers should work with Environmental Restoration managers to determine if PFCs are known or suspected to have been released within approximately 1-mile up-gradient to the drinking water source.

8. Navy Public Water Systems in the United States subject to this policy must complete sampling and testing by December 31, 2015. Navy ODW systems must complete sampling by March 31, 2016. One sample per drinking water system is required and EPA Method 537 Rev 1.1 must be used for analyzing all samples. Samples must be processed in a laboratory accredited for EPA Method 537 Rev 1.1. Enclosure (2) provides a list of laboratories approved for EPA Method 537. Navy ODW systems must also use a U.S. laboratory approved for EPA Method 537. Given the low detection limits associated with PFC analysis and the many potential sources of trace levels of PFCs, personnel are advised to follow the protocols in Enclosure (3).

9. If a PFOS or PFOA sample exceeds the PHA at any Navy drinking water system, alternative drinking water must be supplied until these levels can be reduced below the PHAs. Exceedances and corrective actions shall be reported to the chain of command and consultation with the Navy Marine Corps Public Health Center should be initiated to determine allowable uses for the water in accordance with reference (c).

10. If a PFOS or PFOA sample is below the PHA, but is detected above the Minimum Reporting Level (0.04 ug/l and 0.02 ug/l respectively), the Navy drinking water system should coordinate possible follow-up actions with the chain of command. This may include additional sampling and monitoring to ensure the PFOS and PFOA levels in the drinking water system remain below the PHAs.

11. Funding for sampling and testing shall be programmed as an emergent project in Navy's Environmental Portal, Environmental Program Requirements Web (EPR Web) Guidebook number 05999 using Environmental Readiness Level 4 to ensure projects receive the highest priority for funding. Funding for implementation of corrective actions is the responsibility of the installation Public Works Officer.

12. All results of UCMR 3 PFOS/PFOA sampling, and Navy Public Water System sampling under this policy shall be submitted to OPNAV N45 by 15 February 2016. ODW System sampling shall be submitted to OPNAV N45 no later than 15 May 2016.

13. My point of contact is Ms. Lindsay R. Nehm, N452E, at (703) 695-5179, DSN 225-5179, or e-mail Lindsay.nehm@navy.mil.

1000 NAVY PENTAGON
WASHINGTON DC 20350-1000

October 21, 2014

MEMORANDUM FOR DEPUTY CHIEF OF NAVAL OPERATIONS (FLEET READINESS AND LOGISTICS) (N4)
DEPUTY COMMANDANT OF THE MARINE CORPS (INSTALLATIONS AND LOGISTICS)

SUBJECT: Perfluorinated Compounds (PFCs) – An Emerging Environmental Issue

References: (a) OPNAVINST 5090.1D
(b) MCO P5090.2A
(c) DoDI 4715.18
(d) SECNAV Info Memo, 29 Jul 2014

The Department of the Navy (DON) is committed to ensuring all men, women, and children who live or work on DON installations and facilities are protected from environmental contaminants and receive safe drinking water. Navy and Marine Corps maintain comprehensive environmental instructions (references (a) and (b)) detailing procedures to meet and exceed requirements found in statute, regulation, and policy. Reference (c) established Department of Defense (DoD) policy relative to emerging contaminants, such as PFCs.

PFCs are a suite of chemicals of emerging public health concern to the U.S. Environmental Protection Agency (EPA) and state regulators, primarily in drinking water systems. One of the major DoD uses of PFCs is as a fire extinguishing agent in aqueous film forming foam (AFFF). EPA added new PFC sampling requirements under the Safe Drinking Water Act (SDWA) Unregulated Contaminant Monitoring Rule 3 (UCMR 3), requiring all large and 800 small public water systems to test for these chemical between 2013-2015. This testing is being conducted to determine the extent of PFCs in drinking water systems nationwide and whether drinking water standards should be established.

Per reference (d), my staff coordinated a meeting with the DoD Component subject matter experts to evaluate these emerging contaminants and identify paths forward regarding the future use, cleanup, and protection of DON drinking water systems. To date, only two PFCs (perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA)) have sufficient toxicological information to make cleanup and drinking water safety decisions. DoD is taking the lead and will be conducting a study of AFFF formulations to determine whether safer alternatives are available that meet our firefighting requirements. After coordinating with your Navy and Marine Corps staff, I am directing the following actions be taken regarding PFOS and PFOA cleanup sites and drinking water systems:

- Defense Environmental Restoration Program (DERP) – identify all known and suspected sites where PFOS and/or PFOA may have been released on active and Base Realignment and Closure (BRAC) installations. As appropriate, address these contaminant releases including migration off-site, under DERP and in accordance with reference (c).

- DON drinking water systems in the United States – Ensure all applicable UCMR 3 testing and reporting requirements are met by December 2015. If exceedances of Provisional Health Advisory (PHA) values are identified, supply alternative drinking water until these levels can be reduced below the PHAs. For installations not required to test under the UCMR 3, and where the installation produces drinking water from on-installation sources, by December 2015, sample finished drinking water from all DON systems for PFOS and PFOA where there is an identified or suspected PFC release within approximately 1-mile upgradient to the drinking water source. Address any PHA value exceedances per above.

- DON overseas drinking water systems – DERP does not apply overseas, so PFC release site information may not be available. Therefore, all DON overseas drinking water systems shall be sampled for PFOS and PFOA by December 2015 and any PHA value exceedances addressed per above.

- Drinking water systems with detections above the Method Reporting Limit (MRL), but below the PHA value shall determine appropriate follow-up actions, in coordination with the chain of command, which may include additional sampling to ensure levels in drinking water, remain below the PHA value.

- Report all drinking water PHA value and MRL exceedances and corrective actions to my office.

My point of contact is Mr. Richard Mach at (703) 614-5463 or richard.mach@navy.mil.

Donald R. Schregardus

EPA Approved Laboratories for UCMR 3

These laboratories met the Unregulated Contaminant Monitoring Rule 3 (UCMR 3) Laboratory Approval Program application and Proficiency Testing (PT) criteria for the methods indicated. End of List

The Laboratory Approval Program is voluntary, and is specific to laboratories analyzing samples for UCMR 3. The laboratories' approval status indicates they have demonstrated specific capabilities using the method(s).

Public water systems (PWSs) are responsible for their laboratories, and must ensure they are following the methods and meeting the quality control (QC) criteria specified in UCMR 3. Laboratories must post sample analytical results and required QC data electronically via the Safe Drinking Water Accession and Review System (SDWARS) within 120 days of the sample collection date. EPA may revoke a laboratory's approval status if the laboratory does not adhere to quality assurance/quality control (QA/QC) procedures and criteria, or fails to post data to SDWARS. If EPA revokes approval, the laboratory's name will no longer appear on this list. Once approval has been revoked, the laboratory cannot be re-approved during the UCMR 3 monitoring period.

Questions: UCMR Message Center (800) 949-1581

FIELD SAMPLING PROTOCOLS TO AVOID CROSS-CONTAMINATION DURING WATER SAMPLING FOR PERFLUORINATED COMPOUNDS (PFCs)

1.0 PURPOSE

While EPA method 537 provides basic guidance on sampling for PFC's in drinking water, due to the potential for cross contamination this Standard Operating Procedure (SOP) addendum describes additional precautionary procedures/considerations when collecting groundwater or drinking water samples. Sampling specific SOPs should also be reviewed prior to conducting field sampling activities at PFC sites.

2.0 SCOPE

This procedure applies to all qualified personnel and subcontractors who collect or otherwise handle water samples for analysis of PFCs. This SOP should be reviewed by all on-site personnel prior to implementation of field activities.

3.0 GENERAL

Given the low detection limits associated with PFC analysis and the many potential sources of trace levels of PFCs, field personnel are advised to act on the side of caution by strictly following these protocols, frequently replacing nitrile gloves, and rinsing field equipment to help mitigate the potential for background contamination detections of PFCs. Specific items related to field sampling are discussed below.

4.0 PROCEDURES/CONSIDERATIONS

The following are procedures/considerations to be made during field activities at potential PFC release sites.

Field Equipment

- **Do not use Teflon®-containing materials** (e.g., Teflon® tubing, bailers, tape, plumbing paste, or other Teflon® materials) since Teflon® contains fluorinated compounds.
- High-density polyethylene (HDPE), low-density polyethylene (LDPE), and silicon materials are acceptable for sampling. Samples should not be stored in containers made of LDPE materials.
- To avoid plastic coating or glue materials, **do not use waterproof field books**. Field reports should be documented on loose paper on masonite or aluminum clipboards (i.e. plastic clipboards, binders, or spiral hard cover notebooks are not acceptable). Sharpies®/markers should be avoided.
- **Post-It Notes are not allowed** on project sites.

- **Do not use markers.** Pens should be used when documenting field activities in the field log and on field forms as well as labeling sample containers and preparing the Chain of Custody.
- **Do not use chemical (blue) ice packs** during the sampling program. This includes the use of ice packs for the storage of food and/or samples.

Field Clothing and Personal Protective Equipment

- **Do not wear water resistant, waterproof, or stain-treated clothing** during the field program. Field clothing made of synthetic and natural fibers (preferably cotton) are acceptable. Field clothing should be laundered avoiding the use of fabric softener. Preferably, field gear should be cotton construction and well laundered (a minimum of 6 times from time of purchase). New clothing may contain PFC related treatments. **Do not use new clothing** while sampling or sample handling.
- **Do not wear clothing or boots containing Gore-Tex™** during the sampling program as it consists of a PFC membrane.
- All safety footwear will consist of steel-toed boots made with polyurethane and polyvinyl chloride (PVC).
- **Do not wear Tyvek® clothing** on-site since it contains fluorinated compounds.
- Disposable nitrile gloves must be worn at all times. Further, a new pair of nitrile gloves should be donned prior to the following activities at each sample location:
  - Decontamination of re-usable sampling equipment;
  - Prior to contact with sample bottles or water containers;
  - Insertion of anything into the well (e.g. HDPE tubing, HydraSleeve bailer, etc.);
  - Insertion of silicon tubing into the peristaltic pump;
  - Completion of monitor well purging, prior to sample collection;
  - Handling of any quality assurance/quality control samples including field blanks and equipment blanks; and,
  - After the handling of any non-dedicated sampling equipment, contact with non-decontaminated surfaces, or when judged necessary by field personnel.

Sample Containers

- Samples should be collected in polypropylene or HDPE bottles fitted with an unlined (no Teflon®), polypropylene HDPE screw cap. This is an especially important point as many laboratories utilize Teflon-lined bottles.
- Container labels will be completed using pen (**NO MARKERS**) after the caps have been placed back on each bottle.

- Glass containers should also be avoided due to potential loss of analyte through adsorption.

Wet Weather

- Field sampling occurring during wet weather (e.g., rainfall and snowfall) should be conducted while wearing appropriate clothing that will not pose a risk for cross-contamination. Teams should avoid synthetic gear that has been treated with water-repellant finishes containing PFCs. Use rain gear made from polyurethane and wax-coated materials.

Equipment Decontamination

For GW sampling, it is highly recommended that disposable equipment be utilized. However, if equipment re-use is performed, field sampling equipment, including oil/water interface meters and water level indicators, that are utilized at each sample location will require cleaning between uses. Alconox® and Liquinox® soap is acceptable for use since the Material Safety Data Sheets do not list fluoro-surfactants as an ingredient. However, **Decon 90 must not be used** during decontamination activities. Water used for the decontamination of sampling equipment will be laboratory certified "PFC-free" water.

Personnel Hygiene

- Field personnel should not use cosmetics, moisturizers, hand cream, or other related products as part of their personal cleaning/showering routine on the morning of a sampling event, as these products may contain surfactants and represent a potential source of PFCs.
- Many manufactured sunblock and insect repellants contain PFCs and should not be brought or used on-site. Sunblock and insect repellants that are used on-site should consist of 100% natural ingredients.

Food Considerations

- No food or drink shall be brought on-site, with the exception of bottled water and hydration drinks (i.e., Gatorade® and Powerade®).

Blanks

- Utilization of blanks is a good quality check to monitor and control the effects of contamination. Trip blanks and field blanks are recommended.

Subj: Sampling and Testing for Perfluorinated Compounds (PFCs) in Drinking Water

Purpose: To comply with the requirements of the Deputy Assistant Secretary of the Navy (Environment) (DASN(E)) memorandum dated 21 October 2014, "Perfluorinated Compounds (PFCs) – An Emerging Environmental Issue." This policy supports efforts to ensure that all men, women, and children who live or work on Department of the Navy (DON) installations and facilities are protected from emerging environmental contaminants such as PFCs and receive safe drinking water.

Tabs: (A) DASN(E) memo of 21 Oct 14, Perfluorinated Compounds (PFCs) – An Emerging Environmental Issue
(B) Marine Corps Restoration Sites with Known or Suspected PFC Contamination
(C) DON Drinking Water Systems in the United States - Drinking Water Wells Near Environmental Restoration (ER) Sites
(D) EM Portal Instructions

Comments:

1. Installations subject to the Third Unregulated Contaminant Monitoring Rule (UCMR 3) must ensure all applicable testing and reporting requirements are met by December 2015. Per the memo in Tab (A), if exceedances of Provisional Health Advisory (PHA) values are identified, installations must inform HQMC/MCICOM and supply alternative drinking water until these levels can be reduced below the PHAs.

2. Per the memo in Tab (A), installations not already subject to the UCMR 3 requirements and that produce drinking water from on-installation sources must identify drinking water sources (wells or surface water) that are within approximately 1-mile downgradient of an ER site that is suspected to contain PFCs or an active firefighting training site. A list of installations with ER sites that may contain PFCs is provided in Tab (B).

Installations that identify drinking water sources in the vicinity of these sites (ER and Firefighting training) are then required to sample the drinking water system for PFOS/PFOA by 31 December 2015. If exceedances of PHA values are identified, installations must inform HQMC/MCICOM and supply alternative drinking water until these levels can be reduced below the PHAs.

3. MCICOM requests that installations fill in the required information in the spreadsheets contained in Tab (C) for their respective installation. Request that the addressees provide the information via EM Portal following the instructions provided in Tab (D).

4. If you have any questions, please contact Mr. Chris Gamache (christopher.gamache@usmc.mil) or Ms. Misha Turner (misha.turner@usmc.mil).

Due date: 12/31/2015

DEPARTMENT OF THE NAVY
THE ASSISTANT SECRETARY OF THE NAVY
(ENERGY, INSTALLATIONS AND ENVIRONMENT)
1000 NAVY PENTAGON
WASHINGTON DC 20350-1000

October 21, 2014

MEMORANDUM FOR DEPUTY CHIEF OF NAVAL OPERATIONS (FLEET READINESS AND LOGISTICS) (N4)
DEPUTY COMMANDANT OF THE MARINE CORPS (INSTALLATIONS AND LOGISTICS)

SUBJECT: Perfluorinated Compounds (PFCs) – An Emerging Environmental Issue

References: (a) OPNAVINST 5090.1D
(b) MCO P5090.2A
(c) DoDI 4715.18
(d) SECNAV Info Memo, 29 Jul 2014

The Department of the Navy (DON) is committed to ensuring all men, women, and children who live or work on DON installations and facilities are protected from environmental contaminants and receive safe drinking water. Navy and Marine Corps maintain comprehensive environmental instructions (references (a) and (b)) detailing procedures to meet and exceed requirements found in statute, regulation, and policy. Reference (c) established Department of Defense (DoD) policy relative to emerging contaminants, such as PFCs.

PFCs are a suite of chemicals of emerging public health concern to the U.S. Environmental Protection Agency (EPA) and state regulators, primarily in drinking water systems. One of the major DoD uses of PFCs is as a fire extinguishing agent in aqueous film forming foam (AFFF). EPA added new PFC sampling requirements under the Safe Drinking Water Act (SDWA) Unregulated Contaminant Monitoring Rule 3 (UCMR 3), requiring all large and 800 small public water systems to test for these chemical between 2013-2015. This testing is being conducted to determine the extent of PFCs in drinking water systems nationwide and whether drinking water standards should be established.

Per reference (d), my staff coordinated a meeting with the DoD Component subject matter experts to evaluate these emerging contaminants and identify paths forward regarding the future use, cleanup, and protection of DON drinking water systems. To date, only two PFCs (perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA)) have sufficient toxicological information to make cleanup and drinking water safety decisions. DoD is taking the lead and will be conducting a study of AFFF formulations to determine whether safer alternatives are available that meet our firefighting requirements. After coordinating with your Navy and Marine Corps staff, I am directing the following actions be taken regarding PFOS and PFOA cleanup sites and drinking water systems:

- Defense Environmental Restoration Program (DERP) – identify all known and suspected sites where PFOS and/or PFOA may have been released on active and Base Realignment and Closure (BRAC) installations. As appropriate, address these contaminant releases including migration off-site, under DERP and in accordance with reference (c).

- DON drinking water systems in the United States – Ensure all applicable UCMR 3 testing and reporting requirements are met by December 2015. If exceedances of Provisional Health Advisory (PHA) values are identified, supply alternative drinking water until these levels can be reduced below the PHAs. For installations not required to test under the UCMR 3, and where the installation produces drinking water from on-installation sources, by December 2015, sample finished drinking water from all DON systems for PFOS and PFOA where there is an identified or suspected PFC release within approximately 1-mile upgradient to the drinking water source. Address any PHA value exceedances per above.

- DON overseas drinking water systems – DERP does not apply overseas, so PFC release site information may not be available. Therefore, all DON overseas drinking water systems shall be sampled for PFOS and PFOA by December 2015 and any PHA value exceedances addressed per above.

- Drinking water systems with detections above the Method Reporting Limit (MRL), but below the PHA value shall determine appropriate follow-up actions, in coordination with the chain of command, which may include additional sampling to ensure levels in drinking water, remain below the PHA value.

- Report all drinking water PHA value and MRL exceedances and corrective actions to my office.

My point of contact is Mr. Richard Mach at (703) 614-5463 or richard.mach@navy.mil.

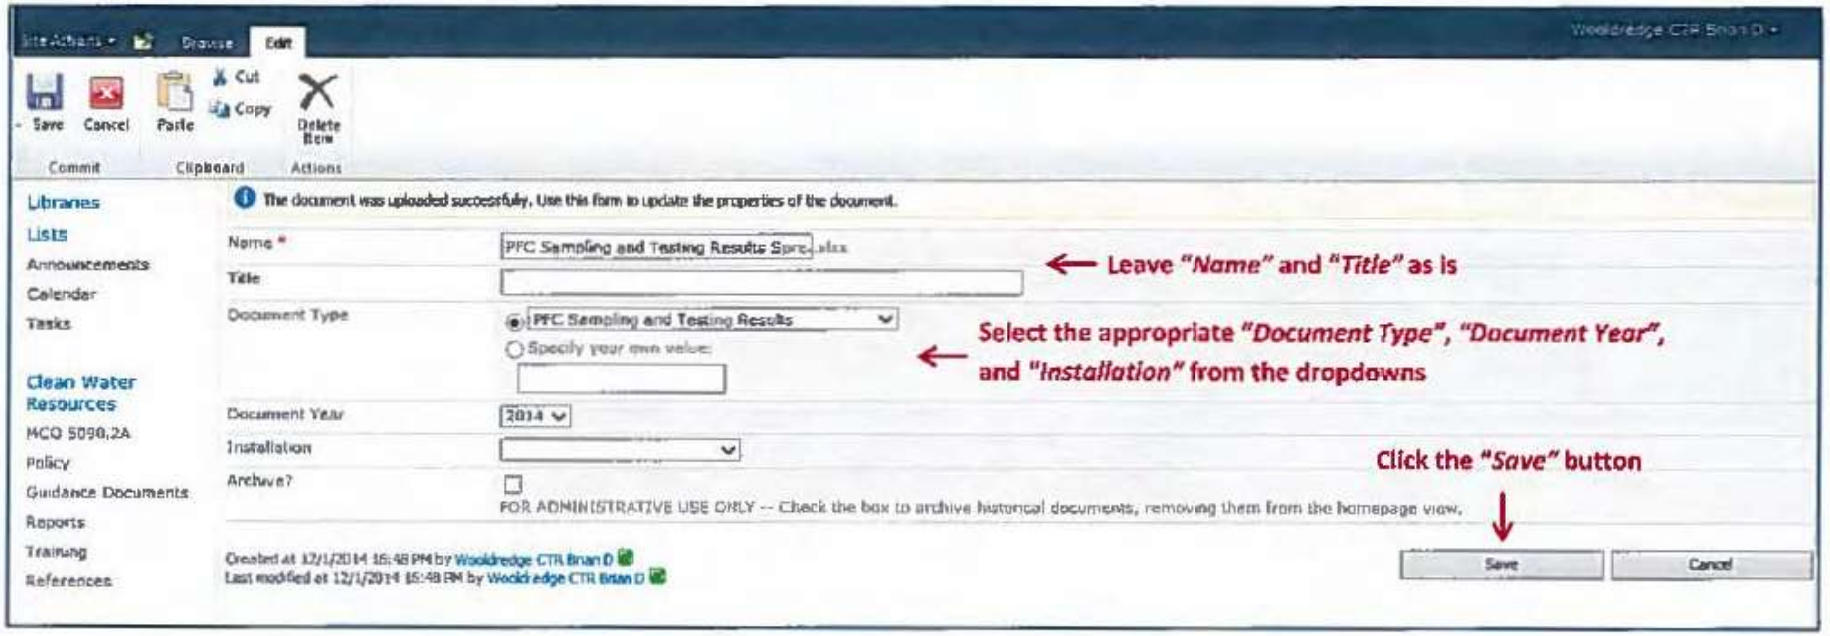
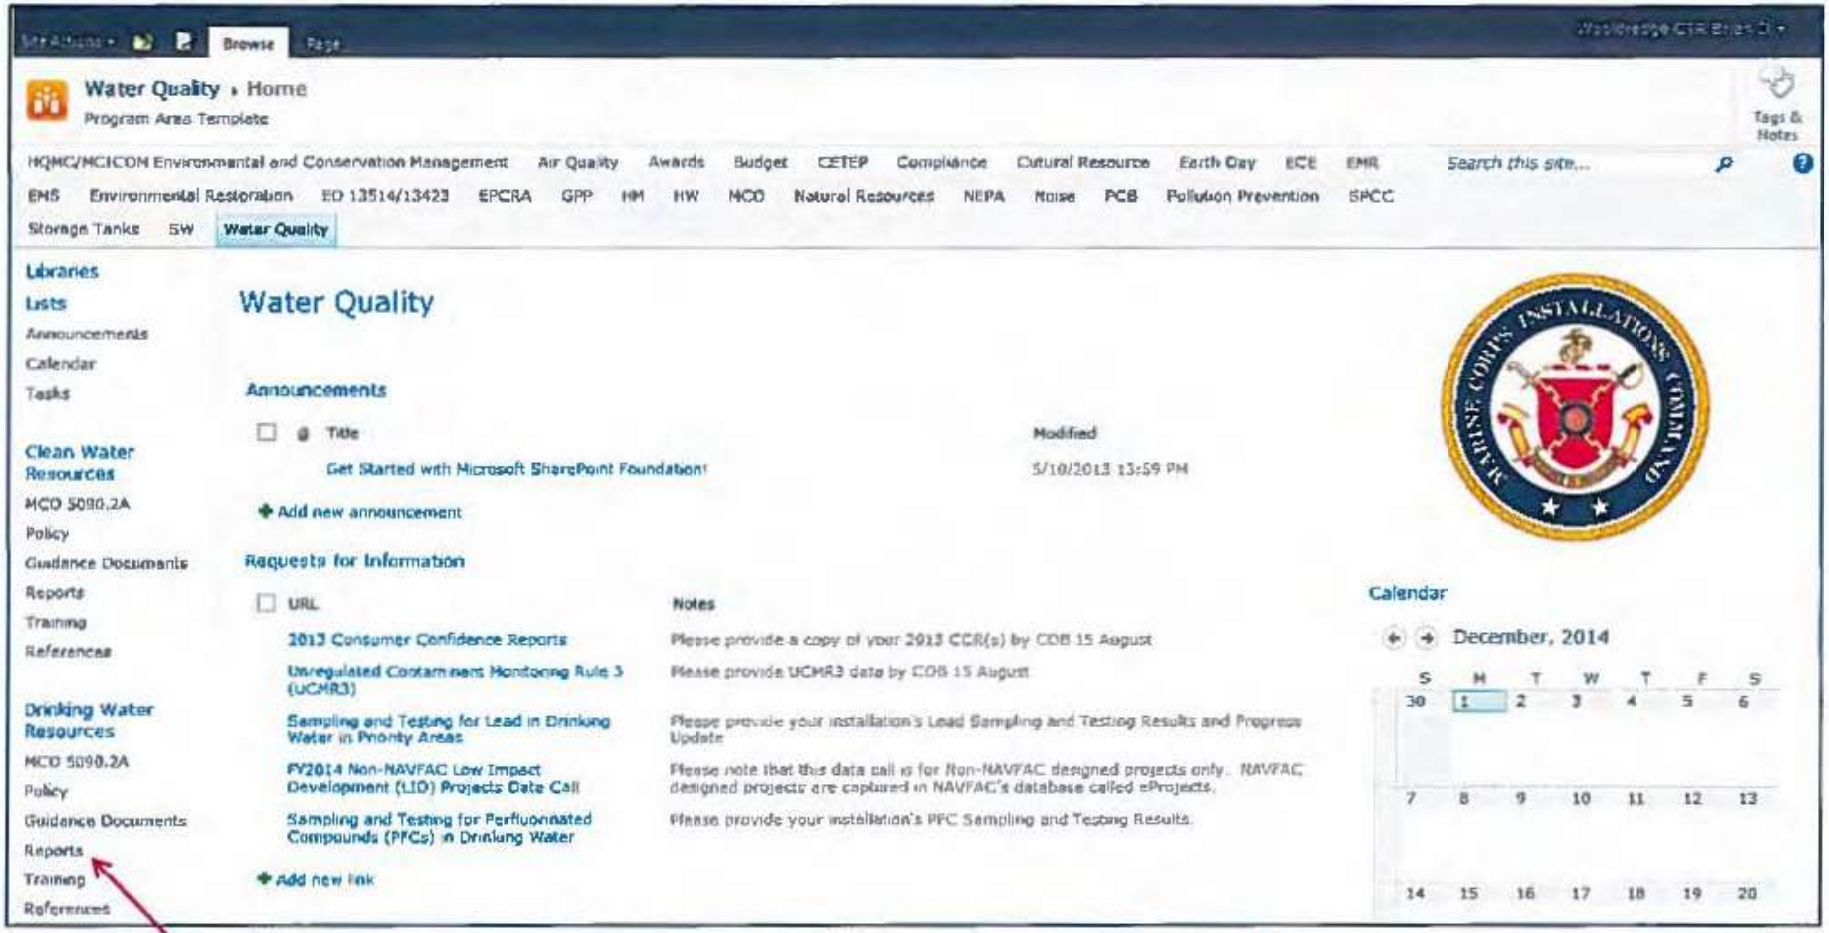
DON Drinking Water Systems Overseas - PFOS/PFOA testing of all Drinking Water Systems										
Installation	If Site Name or Firefighting Training Location	Drinking Water System Name	PWSID	If not DoD use, is in Vicinity of Site	Water Source	Sample Location Name	Sample Date (mm/dd/yyyy)	Contaminant (PFOS or PFOA)	MCL (ppb)	Sample Concentration (ppb)

Submitting Sampling & Testing for Perfluorinated Compounds (PFCs) Results through EM Portal

1. Navigate to the EM Portal Water Quality Site at https://em.usmc.mil/sites/hq/cleanwater/SitePages/Home.aspx.



Click the *"Sampling and Testing for Perfluorinated Compounds (PFCs) in Drinking Water"* link



2. Upload your installation's PFC Sampling and Testing Results spreadsheet.

3. Update the properties of your uploaded document.

4. Locate your uploaded documents by using the shortcuts along the left-hand sidebar.

Click "Reports" under the "Drinking Water Resources" library to view your successfully uploaded documents.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by AECOM were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes

available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 02/06/2019 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are

3 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal landfill and/or solid waste disposal site lists

OR SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Department of Environmental Quality's Closure & Regular Solid Waste Active Disposal Permits database.

A review of the OR SWF/LF list, as provided by EDR, and dated 01/14/2019 has revealed that there are 3 OR SWF/LF sites within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 7 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Updated By: DHAFLEY
Updated Date: 09/19/2017
Decode for NarcdID: Project Issues Summary
NARR Comments: No further action required for Sites 5,7,8, & 10. 2004 identified treatement for Sites 2 and 9 consisting of in-situ chemical oxidation (ISCO) treatment, and excavation of contaminated ditch sediments at Site 4. Treatment at Site 2 including 6 ISCO injections was completed, and post-injection monitoring is currently taking place. At Site 9, TPH constituents degraded to below target cleanup levels without treatment, and a NFA was issued in 2008. At Site 4, removal of contaminated ditch sediments was completed in 2007, and an NFA is pending. At Site 11, initial IRM treatment consisting of ISCO was relatively unsuccessful, and the treatment plan was modified. Injection of emulsified oil to stimulate enhanced in-situ bioremediation to treat remaining VOC contamination was started in 2007. An additional phase of in-situ treatment (injection of emulsified) occured starting in September 2009. Post-treatment groundwater monitoring is ongoing at the combined Sites 1,2, and, 3 (referred to as Site 2), with contaminant concentrations generally below EPA MCLs. DEQ has recommended in-situ treatment at three well locations to address residual solvent contamination above MCL; work is expected to take place in late 2009 or 2010. Site 4 (including Building 430) work is complete; a NFA determination was made for this area on July 27, 2009. Based on continuing elevated (modestly) HVOCs in Site 2 and 11, additional injection work was completed in 2010. At Site 2, emulsified oil and EHC were injected. At Site 11, emulsified oil was injected. Post-injection monitoring is ongoing. In June 2011, an Explanation of Significant Differences was approved by DEQ for sites 1,2,3, and 11. The ESD included modestly revised cleanup levels for site contaminants. Based on the results of July 2011 groundwater monitoring, cleanup levels have largely been achieved. A proposal for compliance monitoring through 2013 has been approved. On a separate

OREGON AIR NATIONAL GUARD BASE (Continued) **S105527699**

track, DEQ is overseeing investigation and cleanup related to two smaller releases on the ANG facility. A diesel generator spill site characterization report was approved by DEQ in June 2011, and a corrective action plan pending. An investigation work plan for an release to site ditches related to an on-site oil/water separator was approved, and soil removal completed in October 2012. 8 tons of soil were removed. Based on sampling results, DEQ determined in September 2012 that no further action is necessary in this area. Results of Sites 1, 2, 3, and 11 performance monitoring were presented in an October 2011 report (performance monitoring event #2). At Sites 1, 2, 3 (collectively Site 2), no exceedances of cleanup levels were observed. At Site 11, vinyl chloride was elevated at 3 locations to a maximum of 29 ug/L. In December 2011, DEQ reviewed a revised Investigation Report that presented the results of additional sampling in the ditch segments impacted by the oil/water separator release at the site. Based on the results from August 2011 sampling, DEQ concluded that residual contamination from the separator release does not exceed risk-based screening values. No further action is necessary as documented in a 12/14/11 letter to the Guard. In September 2017 DEQ concurred with ANG's No Further Remedial Action Planned (NFRAP) determination for Sites 1, 2, 3, and 11. this followed extensive work to investigate and clean up chlorinated solvent plumes at the based. A PA was completed in 2016, and site investigation is planned for 2018 to assses whether perfluorinated compounds associated with AFFF storage and use has impacted base environmental media.

NARR Comments: Site is located within approximately 1 mile of the City of Portland's Columbia South Shore Wellfield. The water table depth varies across the site from about 6 to 15 feet, and groundwater flow direction appears to vary, depending on the season and the level of the

OREGON AIR NATIONAL GUARD BASE (Continued) **S105527699**

Columbia Slough. Shallow groundwater in the Overbank Deposits aquifer has been impacted, but the underlying Columbia Sand Aquifer has not. Primary pathways of concern hypotentical groundwater ingestion (there is no current use of shallow groundwater in the site area), and vapor intrusion into site buildings. With the 2007 cleanup of Site 4 ditches, significant ecological exposure is not likely.

Decode for NarcdID: Current Site Summary Statement
NARR Comments: As of October 2011, remedial action at most site areas has been completed. Remaining site work includes post-treatment groundwater monitoring at Sites 1, 2, 3 and 11, and work to address petroleum releases at an on-site diesel generator and in an unlined ditch near the fueling area oil/water separator. In December 2011 DEQ reviewed and approved a report for the oil/water separator ditch release. The report presented the results of ditch sampling and risk screening, and concluded that residual contamination from the release does not pose a significant risk to public health or the environment. Semi-annual monitoring in the Site 2 and 11 areas is ongoing. In September 2012, DEQ determined that no further action is necessary in the Building 433 diesel spill area. Also in fall 2012, DEQ reviewed and approved a work plan for additional investigation in the so-called Surplus Area, a portion of the ANG site that is not being used by the Guard and will apparently be returned to the Port of

OREGON AIR NATIONAL GUARD BASE (Continued) **S105527699**

Portland. Soil and groundwater under the approved plan is pending. Leaking sewer have also been identified as a concern in the southern site. The Guard is presently seeking funding for sewer repair and related investigation work under DEQ. April 2013. Post-treatment monitoring indicates that groundwater contaminants in the Sites 1,2,3, and 11 areas are below remedial action levels. ANG's consultant has requested proceeding to NFA. DEQ is in general agreement, but has requested one additional round of sampling for two wells to confirm contaminant trends. Based on April 2013 sampling results, DEQ has deterimined that Site 1, 2, 3, and 11 treatment and monitoring is complete. Surplus area sampling has been completed, and generally identified no or low levels of contamination. A modest amount of followup investigation has been requested. Following additional sampling, soil in a low-lying portion of the Surplus with elevated PAHs was covered with a minimum of two feet of clean fill as part of ditch abandonment activity. Soil from the <quot>dogleg<quot> portion of the soil stockpile remains on-site, and has modestly elevated PAHs. Off-site disposal of the soil at a Subtitle D landfill is pending. A summary of Surplus work is presented in the October 2013 Final Phase II EBS Site Assessment Report received by DEQ. A work plan for closeout activities at the Portland ANG site under the Environmental Restoration Program/DSMOA with the Guard has been approved. Closure will include all of the so-called Portland ANG <quot>Sites<quot> including Sites 1, 2,3, and 11 where solvent plumes were present. Closure will not include <quot>side<quot> projects with Portland ANG including assessment of impacts associated with leaking sewers (soon to be replaced), and an oil/water separator which will be upgraded. A final work plan for investigation activities at the former vehicle maintenance area (Building 188) has been received. Sampling is expected to take place in April or May 2013. Update: sampling has been completed, and no significant contamination was detected. A Revised Final Site Investigation Report for Building 188 was approved by DEQ in December 2013. (May 2014, DJH). DEQ was contacted regarding a jet fuel release (spill), and completed a site visit. A localized of perhaps 40 gallons of fuel occurred. ANG has sampled the impacted (soil) area, and results are pending. The spill will be addressed through DEQ's Cleanup Program. Separately, repair of the on-site sanitary sewer system has begun, and a RFP will be issued shortly by the Guard for site-wide closure activities under the Environmental Restoration Program. (June 2016, DJH). Site closure for all DSMOA investigation/cleanup areas is ongoing, with a final closure document to be submitted to DEQ in 2016. Only minor contaminant issues remain, the most notable being a pending investigation (2017) by the Guard to assess whether perfluorinated compounds have been released onsite associated with use of flame retardant chemicals. (February 2017, DJH). Closure report for Sites 1, 2, 3, & 11 received by DEQ and currently under review. September 2017, DJH). DEQ issues a letter concurring with ANG's NFRAP determination for Sites 1, 2, 3, 11. SI-level investigation of perfluorinated compounds will occur in early 2018. April 2018, DJH. PFAS investigation work plan (Phase III) finalized and submitted to DEQ April 2018. Multi-media (soil, groundwater, stormwater, and sediment) sampling was completed by contractor in summer 2018. Results received in October, and plans for follow-up investigation (SI) by DOD are pending. November 2018. PFAS detected in soil, sediment, surface water, and groundwater. Results presented in Site Inspection Report (October 2018). Followup investigation by Guard

Incident Narrative:	HM06 CALLED TO PORTLAND AIR BASE ON A SUSPICIOUS WHITE POWDER. HM06

OREGON AIR NATIONAL GUARD BASE (Continued) **S105527699**

ARRIVED AND WAS BRIEFED BY THE PORT OF PORLAND FIRE DEPT. AND THE PORTLAND AIR BASE COMMANDERS. WE WERE INFORMED AN ENVELOPE WAS DELIVERED TO A SECRETARY FROM MCI COMMUNICATIONS. INITIAL REPORTS WERE POWDER SPILLED OUT OF THE PACKAGE ON 1-10-02. THE PACKAGE WAS NOW IN THE RECYCLING. HM06 SUITED UP TWO MEMBERS IN LEVEL "C". WE ALSO SENT ONE PORT OF PORTLAND FF IN LEVEL "C" TO INVESTIGATE AND SHOW US THE LOCATION OF THE OFFICE SPACE AND THE RECYCLING. HM06 FOUND THE ENVELOPE AND FOUND NOTHNG TO SAMPLE. WE INVESTIGATED THE OFFICE SPACE AND FOUND NOTHING TO SAMPLE. UPON INTERVIEWS WITH COMPLAINTENT AND WITNESSES WE SUMISED THE DUST MOST LIKELY CAME FROM THE PACKING TAPE. WE ALSO FOUND NO REASON FOR THIS PERSON TO BE A TARGET. THIS PACKAGE WAS A NORMAL DELIVERY FROM A KNOWN SHIPPER. USING ALL THE INFORMATION WE DETERMINED THIS WAS PROBABLY A MISTAKEN CALL.

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No

USAF ANG PORTLAND (Continued) **1015731785**

Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D003
. Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 3027

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 86

Waste code: D003

USAF ANG PORTLAND (Continued) **1015731785**

Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Amount (Lbs):	1171
Waste code:	D005
Waste name:	BARIUM
Amount (Lbs):	3910
Waste code:	D006
Waste name:	CADMIUM
Amount (Lbs):	8345
Waste code:	D007
Waste name:	CHROMIUM
Amount (Lbs):	4310
Waste code:	D008

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

FEDERAL FACILITY HAZARDOUS WASTE DOCKET

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that

USAF OREGON AIR NATIONAL GUARD BASE PORTLAND (Continued) **1016093141**

discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AIR MINOR

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D007
. Waste name: CHROMIUM

SILVER EAGLE MANUFACTURING COMPANY (Continued) **1001125301**

. Waste code: D035
. Waste name: METHYL ETHYL KETONE

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F019
. Waste name: WASTEWATER TREATMENT SLUDGES FROM THE CHEMICAL CONVERSION COATING OF ALUMINUM EXCEPT FROM ZIRCONIUM PHOSPHATING IN ALUMINUM CAN WASHING WHEN SUCH PHOSPHATING IS AN EXCLUSIVE CONVERSION COATING PROCESS.

FINDS:

Registry ID: 110001658386

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

BLOCK GRAPHICS INC (Continued) **1004580711**

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

OSHA ESTABLISHMENT

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Applicable Unit Of Measure Code:	1
Description Of The Unit Of Measure:	POUNDS
Type Code:	R
Description:	OTHER
Type Code:	Not reported
Temperature Description:	Not reported
Pressure of Code:	1
Pressure Description:	NORMAL PRESSURE
Pressure of Code:	Not reported
Pressure Description:	Not reported
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	Not reported
Temperature of The Hazardous Substance Code:	Not reported
Days Hazardous Substance On Site During Year:	365
Is The Substance Protected A Trade Secret:	False
Description Of The Max Qnty Code:	5,000-9,999
Description Of The Avg Qnty Code:	5,000-9,999
Most Hazardous Ingridient:	SULFURIC ACID

BLOCK GRAPHICS INC (Continued) **1004580711**

United Nations/north America 4 Digit Class Number:	2794
Hazard Rank:	4
EHS Ingredient:	SULFURIC ACID
Substance Pure:	False
Substance Mix:	True
First Hazardous Class Code For Chemical:	Acute Health Hazard
Second Hazardous Class Code For Chemical:	Corrosive Material
Third Hazardous Class Code For Chemical:	Chronic Health Hazard
Hazard Class 1 Of The Chemical:	6.3
Hazard Class 2 Of The Chemical:	8.0
Hazard Class 3 Of The Chemical:	6.4

Chemical:

Chemical Name:	LEAD ACID BATTERIES
United Nations/north America 4 Digit Class Number:	2794
Chemical Abstract Service Identifier Number:	Not reported
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Acute Health Hazard
Second Hazardous Class Code For Chemical:	Corrosive Material
Third Hazardous Class Code For Chemical:	Chronic Health Hazard
Hazard Class 1 Of The Chemical:	6.3
Hazard Class 2 Of The Chemical:	8.0
Hazard Class 3 Of The Chemical:	6.4
Chemical Is A Toxic 313 Chemical:	N
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	Y
Fertilizer:	N
Pesticide:	N
Contains 313:	Y

Chemical Name:	GUM AQ 767P
Physical Description:	LIQUID
Case Number:	57556
Facility Id:	003769
Physical State Of The Substance:	2
Avag Amt Possessed During Year CD:	10
Max Amt Possessed During Year CD:	11
Applicable Unit Of Measure Code:	2
Description Of The Unit Of Measure:	GALLONS
Type Code:	O
Description:	TOTEBIN
Type Code:	Not reported
Temperature Description:	Not reported
Pressure of Code:	1
Pressure Description:	NORMAL PRESSURE
Pressure of Code:	Not reported
Pressure Description:	Not reported
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	Not reported
Temperature of The Hazardous Substance Code:	Not reported
Days Hazardous Substance On Site During Year:	365
Is The Substance Protected A Trade Secret:	False
Description Of The Max Qnty Code:	500-999
Description Of The Avg Qnty Code:	200-499
Most Hazardous Ingridient:	1,2-PROPANEDIOL

BLOCK GRAPHICS INC (Continued) **1004580711**

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

FINDS:

Registry ID: 110004796481

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Facility Id:	015162
Physical State Of The Substance:	2
Avag Amt Possessed During Year CD:	30
Max Amt Possessed During Year CD:	30
Applicable Unit Of Measure Code:	2
Description Of The Unit Of Measure:	GALLONS
Type Code:	D
Description:	STEEL DRUM

SHERWIN WILLIAMS CO #4383 (Continued) **1000371857**

Type Code:	F
Temperature Description:	CAN
Pressure of Code:	1
Pressure Description:	NORMAL PRESSURE
Pressure of Code:	1
Pressure Description:	NORMAL PRESSURE
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Days Hazardous Substance On Site During Year:	365
Is The Substance Protected A Trade Secret:	False
Description Of The Max Qnty Code:	10,000-49,999
Description Of The Avg Qnty Code:	10,000-49,999
Most Hazardous Ingridient:	ISOBUTYL ACETATE
United Nations/north America 4 Digit Class Number:	1263
Hazard Rank:	2
EHS Ingredient:	Not reported
Substance Pure:	False
Substance Mix:	True
First Hazardous Class Code For Chemical:	Flammable and Combustible Liquid
Second Hazardous Class Code For Chemical:	Acute Health Hazard
Third Hazardous Class Code For Chemical:	Chronic Health Hazard
Hazard Class 1 Of The Chemical:	3.0
Hazard Class 2 Of The Chemical:	6.3
Hazard Class 3 Of The Chemical:	6.4

Chemical:

Chemical Name:	SOLVENT BASED COATINGS
United Nations/north America 4 Digit Class Number:	1263
Chemical Abstract Service Identifier Number:	110190
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Flammable and Combustible Liquid
Second Hazardous Class Code For Chemical:	Acute Health Hazard
Third Hazardous Class Code For Chemical:	Chronic Health Hazard
Hazard Class 1 Of The Chemical:	3.0
Hazard Class 2 Of The Chemical:	6.3
Hazard Class 3 Of The Chemical:	6.4
Chemical Is A Toxic 313 Chemical:	N
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	N
Fertilizer:	N
Pesticide:	N
Contains 313:	Y

Chemical Name:	WATER BASED COATINGS-ACRYLIC
Physical Description:	LIQUID
Case Number:	471341
Facility Id:	015162
Physical State Of The Substance:	2
Avag Amt Possessed During Year CD:	21
Max Amt Possessed During Year CD:	30
Applicable Unit Of Measure Code:	2
Description Of The Unit Of Measure:	GALLONS
Type Code:	D
Description:	STEEL DRUM

SHERWIN WILLIAMS CO #4383 (Continued) **1000371857**

FINDS:

Registry ID: 110004797275

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D008
. Waste name: LEAD

. Waste code: D011
. Waste name: SILVER

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Narrative:
Narrative Id: 718
Incident Id: 000434
Incident Narrative: E-14 AND E-890 RESPONDED TO A REPORTED TOLUENE SPILL. FOUND EMPLOYEES CLEANING UP A SPILL OF APPROX. 100 GALS. OF RECLAIMED WASH SOLVENT IN FACILITY PARKING LOT. E14 LEARNED THE SPILL HAD OCCURRED APPROX 1 1/2 HOURS PRIOR TO OUR RESPONSE. RESPONSIBLE PARTIES, JEFF BAYLOUS (MGR) AND SAM GRESS (SUPERVISOR) STATED APPROX 100 GALS OF PRODUCT WENT INTO THE PARKING LOT STORM DRAIN AND DUMPED INTO THE COLUMBIA SLOUGH. VERY LITTLE EVIDENCE OF SPILL REMAINED IN SLOUGH. E14 SPOKE WITH LT COFFEY E41C VIA CELL PHONE. HE NOTIFIED OARS (INCIDENT #2000-2808). E890 NOTIFIED TERRY ELLIS, PORT OF PORTLAND ENVIRONMENTAL SERVICES. E14 SECURED PARKING LOT AREA WITH YELLOW HAZARD TAPE. ADVISED RP NOT TO REMOVE DEBRIS PILE OF CONTAMINATED ABSORBANT UNTIL CONTACTED BY OARS REPRESENTATIVE.
Incident Date: 11/27/2000

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

SAPA INC - COATINGS DIVSION (Continued) **1000189769**

Waste code: F019
Waste name: WASTEWATER TREATMENT SLUDGES FROM THE CHEMICAL CONVERSION COATING OF ALUMINUM EXCEPT FROM ZIRCONIUM PHOSPHATING IN ALUMINUM CAN WASHING WHEN SUCH PHOSPHATING IS AN EXCLUSIVE CONVERSION COATING PROCESS.
Amount (Lbs): 45820

Facility Has Received Notices of Violations:
Regulation violated: Not reported
Area of violation: Generators - Pre-transport
Date violation determined: 05/05/2014
Date achieved compliance: 06/27/2014
Violation lead agency: State
Enforcement action: WRITTEN INFORMAL
Enforcement action date: 05/30/2014
Enf. disposition status: Not reported

PORTLAND WILLAMETTE (Continued) **S108662017**

NARR Comments: Waste chemical sludge from the plant's treatment system was spread on-site for several years prior to 1974. The sludge contained cyanide, copper, chromium, and nickel. There was also a settling pond on-site that has since been filled in. (2/10/92 ALB/SAS) The site is the location of a manufacturer of fireplace equipment. Operations included electroplating which results in the generation of plating wastewater, which was managed with an on-site wastewater treatment facility. The on-site treatment facility, which uses cyanide destruction by chlorination followed by hydroxide precipitation, discharged to the Columbia Slough prior to 1993. Sludges from the treatment faility were landfarmed on the property until 1974. Facility expansion resulted in the removal of soils in the sludge disposal area. The facility had several violations of its NPDES permit for exceeding nickel and/or copper limits. There was a spill of nickel solution in 1976. Chrome was dropped from the process in 1974. A non-PCB transformer oil release occurred at the site in 1992. Most of the impacted soils were removed.

NARR Comments: The 9/8/95 VCP file review memo identified apparently elevated levels of cadmium, chromium, nickel, lead, zinc, and oil in Columbia Slough sediments adjacent to the former NPDES outfall. VCP agreed to defer the investigation of Columbia Slough sediments in the outfall area to the DEQ Columbia Slough study.

NARR Comments: Site Assessment reviewed ECD files and recommended that the site be given a low priority for a Preliminary Assessment. At the same time, Site Assessment determined that no further action was needed regarding a 1992 spill of non-PCB transformer oil. By Letter Agreement, Thomas Industries joined DEQ's Voluntary Cleanup Program (VCP) on 4/24/95, and requested VCP review of environmental investigation reports completed at the site to date to determine if a NFA determination could be made. VCP completed its review and summarized its findings in a memorandum dated 9/8/95. Thomas Industries performed additional soil and groundwater investigation in May 1996 in response to VCP recommendations. Based on the previous work and the May 1996 investigation results, VCP issued a NFA letter to Thomas Industries on July 15, 1996. As agreed, the site investigation did not include an assessment of whether deposition or accumulation of hazardous substances had occurred in the adjacent Columbia Slough. Therefore, the DEQ NFA does not extend to the Slough sediments. The information on that site has been referred to the DEQ Columbia Slough study (see ECSI #2767). 11/24/10 RKW Sediment sampling in the Whitaker Slough inlet, a side slough of the Columbia Slough, was performed in 2007 (see ECSI #2767). The responsible parties for Portland Willamette elected to settle their responsibility for contaminated sediment through a settlement with DEQ. A source control investigation was performed for the uplands portion of the site and is documented in the November 23, 2010 Staff Report/Source Control Decision document. A new NFA document was prepared for the site to update the original NFA with the stormwater source control decision.

PORTLAND WILLAMETTE CO. - SLOUGH SEDIMENTS (Continued) **S103842018**

Created Date: 10/03/2005
Updated By: GWISTAR
Updated Date: 02/14/2006
Decode for NarcdID: Contamination
NARR Comments: Three sediment samples were acquired in February 1994 by Thomas Industries as part of their cleanup efforts. The sediment samples where acquired around the inlet area where PWC process wastewaters discharged. All samples showed elevated levels of diesel- and oil-range petroleum hydrocarbons, cadmium, chromium, lead, nickel, zinc, and cyanide. Copper in sediments was not analyzed for. DEQ has established baseline sediment concentrations for numerous detected contaminants in the Columbia Slough. The Columbia Slough baseline values are statistically based concentrations, developed from sediment sampling events in 1991 and 1994, which represent a system-wide ambient level.<quot> The baseline values were established to help DEQ, the City of Portland and potential responsible parties focus assessment and cleanup efforts on those areas of contamination that represent locally elevated concentrations of contamination above the Slough s ambient level of contamination (visit http://www.deq.state.or.us/nwr/Columbia_Slough/cs.htm for more information). The 1994 measured sediment concentrations of chromium, lead, nickel and cyanide exceed Columbia Slough baseline concentrations for all three of the collected samples. Concentrations of cadmium and zinc exceed the baseline in samples Sed-1 and Sed-3. All detected concentrations of the metals and cyanide exceeded DEQ s established risk-based ecological screening level values (SLVs) for freshwater sediment. PWC sediment concentrations for cadmium, chromium, lead, nickel, zinc, and cyanide are well above concentrations measured in up- and downstream samples. It should be noted that the 1994 PWC sediment samples were not evaluated for copper. Chromium, copper, nickel, and cyanide were contaminants of concern for the upland site (see ECSI #976). NOTES ON PWC WASTE MANAGEMENT AND UPLAND CLEANUP: PWC entered into DEQ s Cleanup Program in April of 1995 to address site contamination from past waste handling practices (see ECSI #976). In July 1996, PWC received a No Further Action (NFA) determination from DEQ for site soil and groundwater issues. At that time, DEQ did not require PWC to address known contamination problems in slough sediments where PWC s wastewater was discharged and those issues were identified separately as ECSI #2767 (this site). Former waste management practices are summarized below: The facility currently manufactures fireplace equipment but has always been a plating operation. Past and present operations included electroplating, generating plating wastewater that is treated on-site. The on-site treatment facility uses cyanide destruction by chlorination followed by hydroxide precipitation. Wastewaters from this process were discharged to the Whitaker Slough until 1993 under a DEQ National Pollution Discharge Elimination System (NPDES) permit. Prior to 1978, treated waste water discharged to a lined settling pond located on the north end of the property, prior to discharging to the Slough. Waste chemical sludge from the plant s treatment system was spread on-site for several years prior to 1974 (estimated to be 1969 to 1974). The sludge contained brass, calcium oxide, cyanide, copper cyanide, copper sulfate, chromium, and nickel sulfate/nickel chloride, alkaline cleaning solutions, sulfuric acid, zinc phosphate, and iron phosphate. The company experienced several exceedances of its NPDES wastewater discharge permit for nickel, cyanide, and pH between April 1990 and February 1992,

PORTLAND WILLAMETTE CO. - SLOUGH SEDIMENTS (Continued) **S103842018**

according to DEQ Water Quality records. After 1993, PWC directed process wastewaters to open fiberglass tanks to enhance evaporation; remaining sludge is collected and managed as hazardous waste.

NARR ID: 5747280
NARR Code: General Site Description
Created By: CHARMAN
Created Date: 10/03/2005
Updated By: CHARMAN
Updated Date: 10/11/2005
Decode for NarcdID: General Site Description
NARR Comments: The site addressed through this evaluation is located in northeast Portland in a section of Whitaker Slough from approximately rivermile 1.11 to 1.17 upstream of the confluence of Whitaker Slough and the main channel of the Columbia Slough (see Figures 1 and 2). The subject site includes the main channel of Whitaker slough and a small rounded inlet. Whitaker Slough is a waterway characterized by slow moving waters surrounded by steep sloped banks. Water flow in this section of the Columbia Slough is managed by the Multnomah County Drainage District, which controls water levels via a series of pumps for the purposes of stormwater management and flood control. The upland source area is the Portland Willamette Company (PWC) property. The PWC electroplating operation is located on 9.74 acres of industrially-zoned land (General Industrial 2, IG2h) in northeast Portland, at 6800 NE 50th Place. The upland area is relatively flat, with a gentle slope to the north, towards the Slough. The upland site is largely paved or covered by a single 198,000 square foot building. Two residential farm-zoned properties are located adjacent to the site to the southeast and about 300 feet to the north and the east of the PWC property (see Figure 2). The upland site is underlain by fine to medium sands below surface fill materials (sand and gravel fill) to depths ranging from 4.5 feet to 12 feet below ground surface. Fine to coarse gravel with fine to medium coarse and/or silt and cobbles were observed beneath the sands to depths of 30 feet in bore holes on the PWC site. Depth to shallow groundwater on the upland site, as measured by monitoring wells, ranges from 16 to 24 feet below ground surface. Shallow groundwater flow direction in the upland area has been measured as being toward the east, in a parallel and opposite direction to the flow of the Slough. The site is located in Section 18, Township 1 North, Range 2 East, Willamette Meridian. During a site visit in September 2005, DEQ noted that the small inlet to the Whitaker Slough just north of PWC had an irrigation pump placed in the water that was used by the neighboring small farm for irrigating food crops. Site stormwater from the upland PWC site is currently regulated and monitored via a National Pollution Discharge Elimination System (NPDES) permit with DEQ s Water Quality division. PWC currently has stormwater discharge points into the Whitaker Slough at three locations two outfalls that discharge into the small inlet area to the northeast and a third that discharges directly into the Slough near the site s western boundary. All three discharge locations are indicated on Figure 2. In addition, the approximate locations of City of Portland stormwater discharge outfalls are indicated on Figure 2.

Decode for NarcdID: Site Location
NARR Comments: The site is located in the Whitaker Slough reach of the Columbia Slough. The area of interest is just downslope (north) of the Portland Willamette Company (PWC) operation and is estimated to extend from Whitaker Slough rivermile (RM) 1.11 to 1.17 upstream from its confluence with the main stem of the Columbia Slough (basically within the east and west property boundaries of PWC). The main area of known contamination in this area is the inlet. See Figures 1 and 2 in Site Photos. See also ECSI #976, the upland site.

Created By: CHARMAN
Created Date: 10/04/2005
Updated By: CHARMAN
Updated Date: 10/11/2005
Decode for NarcdID: Manner of Release
NARR Comments: There were several likely sources of contaminants from the Portland Willamette operation that entered Whitaker Slough. (a) One likely source could have been overland runoff of soils from the area where wastewater treatment sludges were landfarmed on site from 1969 to 1974. there are no records indicating how this area was managed and DEQ assumes the runoff could have entered the Slough at any point along the property s shoreline. It should be noted that PWC s stormwater outfalls have been in place since 1969 and could have provided a preferential pathway for site runoff to enter into Whitaker Slough. (b) Another source was the direct discharge of treated wastewaters from approximately 1974 to 1994 at the mapped discharge point, which is now identified as SW#3. (c) Another potential source of contamination to the Slough is continued discharge of metals via stormwater runoff from the site. DEQ s Stormwater program has records showing that the concentrations of copper in the Portland Willamette Company s stormwater had exceeded the (previous) expected stormwater benchmark of 0.036 mg/L for copper in 2001 and 2002. The benchmark concentration for copper in stormwater has since been increased to 0.1 mg/L.

NARR Comments: This ECSI site designation is focused on the impact of PWC-sourced site contamination that has reached sediments in the Whitaker Slough reach of the Columbia Slough. Exposure pathways for site workers and other possible upland receptors of concern for the PWC site due to soil contamination have been investigated and addressed as part of the remedial evaluation described in ECSI #976. The PWC Slough Sediment site lays within an Environmental Conservation Zone designation established by the City of Portland. The Environmental Conservation zone conserves important resources and functional values in areas where the resources and functional values can be protected while allowing environmentally sensitive urban development. The Environmental Conservation overlay zone is applied wherever the City determines that significant resources and functional values are present. Exposure Pathways of Concern: Direct contact to humans via recreational contact with water and sediment - The Columbia Slough, including the Whitaker Slough reach, is becoming increasingly popular for small watercraft recreation. The Columbia Slough Watershed Council is housed in a building located approximately 0.61 mi downstream from PWC-Slough Sediment site and is used as the launching point for several small-craft boating events during the year. This exposure pathway is considered significant. Direct contact to aquatic and terrestrial species - Aquatic invertebrates and higher food chain species such as fish, piscivorous birds and certain terrestrial mammals could potentially be exposed to certain metals via direct contact with sediments. During a September 2005 site visit DEQ observed evidence of beaver activity in the Slough near the site. This exposure pathway is considered significant. Ingestion by humans, aquatic and terrestrial species via biological uptake, bioconcentration and biomagnification - primarily of cadmium and zinc. Subsistence and recreational fishing has been documented in several sections of the Columbia Slough. This exposure pathway is considered significant. Leaching of sediment contaminants into groundwater Contaminants in sediment pore waters could leach into shallow groundwaters during the dry season and periods when the water table is low. DEQ searched Oregon Water Resource Department (OWRD) records and found no domestic or community water supply wells in T1N R2E Section 18. The closest listed domestic-use well, registered for 6849 NE Columbia Blvd in 1959, is located about 0.5 mile to the southeast of the PWC site. The well is 70 feet deep. DEQ could find no record of the well being decommissioned. There are also two domestic use wells located about 1.65 miles to the west of the site. DEQ considers the potential threat of identified sediment

PORTLAND WILLAMETTE CO. - SLOUGH SEDIMENTS (Continued) **S103842018**

contaminants reaching any of the domestic wells to be low. This site is located approximately 1.08 miles downstream from the western edge of the wellhead protection boundary for the Columbia South Shore Well (CSSW) field, a major backup source of Portland s drinking water. The CSSW is utilized primarily in the summer months to supplant the City s drinking water. However, DEQ considers the threat of identified sediment contaminants reaching the CSSW to be low. Uptake in adjacent farm plant materials As noted in General Site Description, a local small farm has an irrigation water intake located near the area of the known contaminated sediments in the inlet. Contaminants present in the water column or in particulate matter that is brought up by the water intake might be taken up in plant materials. DEQ s judgment, based on visual observation of the farmed land during the September 2005 site visit, is that the crops are for human consumption. Therefore, this exposure pathway is considered significant.

Updated Date: 01/22/2014
Decode for NarcdID: Remedial Action
NARR Comments: (11/29/2000) The Site Assessment Program sent an Information Request Letter in November 2000. A site screeing is recommended. (10/11/05 CWH/SAS) Site Assessment restarted project and notified Portland Willamette Company. A remedial investigation of sediments is needed, under a high priority. (6/14/07 RKW/SRS) A letter agreement signed by Thomas Industries, Cardinal Aluminum, and LIT Holdings received. Work plan for source control and slough sampling being prepared. (11/21/07 RKW/SRS) Sediment samples being collected. (4/2/08 RKW/SRS) Sediment sample results indicate widespread metals contamination, including copper, lead, cadmium, nickel, and zinc, in slough inlet. Additional investigation of discharge pipes planned. (3/18/09 RKW/SRS) Additional investigation of sediments in stormwater pipes upstream of City of Portland Outfall 77A indicated elevated lead, zinc, nickel, other metals, and petroleum and suggested that Outfall 77A as well as the PWC outfall has contributed to sediment contamination in the inlet. (5/29/09 RKW/SRS) Public comment period to run from June 1-30 for a Consent Judgment with DEQ v. Thomas Industries, Cardinal Aluminum, and LIT Holdings Industrial LP (the parties). The parties will pay $350,000 to DEQ to be used by DEQ for investigation, removal, and remedial action in the Whitaker Slough inlet. The parties will also pay $50,000 to DEQ for Natural Resources Damages. These funds will be used by DEQ for restoration work in the Columbia Slough watershed. (10/15/09 RKW/SRS) The Consent Judgment was filed by Multnomah County Circuit Court on September 9, 2009. The upland source control portion of the project is being completed under the original site ECSI number 976. (12/1/10 RKW) Additional DEQ sediment sampling in the Whitaker Slough inlet offshore from the Portland Willamette site is being planned for winter 2011. (3/26/12 RKW) Additional sediment sampling was performed by DEQ in 2011. The report is available at:
http://www.deq.state.or.us/lq/cu/nwr/ColumbiaSlough/ColumbiaSloughSedimentStudyWhitakerSlough.pdf The inlet offshore from Portland Willamette is one of the high priority areas for sediment

PORTLAND WILLAMETTE CO. - SLOUGH SEDIMENTS (Continued) **S103842018**

cleanup. The 2009 settlement described in the Consent Judgment with Portland Willamette owners shifts responsibility for cleanup to DEQ. Sediment sampling in the <quot>pipeshed<quot> for City of Portland Outfall 77A shows that there are additional sources of sediment contamination in the area. Site Assessment work is needed to identify potential sources. (1/22/14 RKW) DEQ, with help from Multnomah Co. Drainage District, is performing a sediment cleanup in the inlet offshore from the Portland Willamette site. Cleanup is being funded by Columbia Slough settlements with cleanup RPs such as Portland Willamette.

NARR Comments: The main threat from the contaminated sediments is to aquatic species via incidental ingestion, direct contact, consumption of contaminated aquatic invertebrates and potentially to terrestrial mammals and humans via consumption of aquatic invertebrates and fish, respectively. Human direct contact exposure to contaminated sediments and possible uptake into consumable plant materials via irrigation are two other potential pathways of exposure. The contaminants of concern for this site are cadmium, chromium, copper, cyanide, lead, nickel and zinc.

NARR Comments: The Whitaker Slough is a 4.8 mile long, eastward trending side channel slough that feeds into the mainstem Columbia Slough about 1.1 miles downstream from the PWC Slough Sediment site. The subject site area was historically fed by upland areas that were originally open space and agriculturally-managed lands. Since the 1960s the upland area has grown increasingly urbanized with addition of industrial, light industrial and warehouse development. The stormwater outfalls, including the wastewater treatment discharge point from the PWC plant, were installed in the late 1960s. The site history for the upland source area (see ECSI #976) was provided to DEQ by the Portland Willamette Company. Prior to 1969 the upland site was agricultural land. The property was developed by the Portland Willamette Company in 1969 which performed electroplating of metal products. Electroplating has occurred at the site since that time but under several different company names and/or ownership. 1969 73: Portland Willamette Company 1973 94: Thomas Industries Inc. March 1994 to April 2002: Byers Industries Inc. April 2002 to May 2002: Wells Fargo Bank May 2002 to Present: Cardinal Aluminum Oregon, LLC For clarification, the business currently (Sept. 2005) operates under the business name Portland Willamette Company (PWC).

Updated Date: 12/17/2002
Decode for NarcdID: Contamination
NARR Comments: (6/7/94 GMW/SAS) In 1989, Riedel Waste Disposal Systems purchased a largely undeveloped 18-acre property here, intending to construct a processing and composting facility for residential refuse. Riedel prepared an environmental assessment at this time, installing 10 monitoring wells. On- and off-site wells contained TCE and PCE, but no soil VOCs were found, and Riedel argued that the source of VOCs was off-site. After a review of hydrogeological data in 1989 and 1990, DEQ agreed and sent Riedel a <quot>no further action<quot> letter. At that time, DEQ established ECSI site #1015 as a regional groundwater site that needed further investigation to determine the source of chlorinated solvents. Riedel operated the compost facility between 1991 and 1992, after which the property transferred to Credit Suisse Bank. More recent groundwater sampling (summer 1993) showed TCE and PCE still to be present, along with very low levels of several other chlorinated solvents.

Updated Date: 12/17/2002
Decode for NarcdID: Remedial Action
NARR Comments: (6/7/94 GMW/SAS) The plume of chlorinated solvents has remained fairly stable since 1989. The cis-1,2-DCE probably results from natural degradation of PCE and TCE. The highest concentrations of solvents have remained in the west-central portion of the site, and presumably downgradient wells have had much lower or nondetect levels of VOCs. Thus, it's unlikely that the VOC plume extends off-site towards the Columbia Slough. A 1990 SAS file review and site reconnaissance found no wells used for drinking water within 3 miles of the site. Because water-level data have shown changing groundwater flow patterns, more data is needed to establish groundwater flow and

METRO METALS NW INC (Continued) **S108661214**

contamination trends, and to confirm that subsurface contamination originated from a specific off-site location or direction. Site Assessment recommends further groundwater evaluation, under low priority. (11/14/97 LSK) Site reevaluated as part of review of all sites within the Columbia Slough Study Area. Area is south of the Whitaker Slough.

NARR Comments: [5/30/17 VCP/SAM] DEQ proposes to enter into a consent judgment with Metro Metals Northwest, Inc. The Consent Judgment outlines DEQ's oversight of remedial design and cleanup of East Whitaker Pond sediments and adjacent soil and wildlife habitat improvement. The consent judgment also includes settlement of Metro Metals' potential liability for contribution to sediment contamination in the Columbia Slough and satisfaction of liability associated with State of Oregon natural resource damages to Whitaker Ponds and the Columbia Slough.

METRO METALS NW INC (Continued) **S108661214**

The selected remedial action consists of the following elements: - Excavation of sediment and soils with relatively higher concentrations of contaminants of concern. - Placement of activated carbon in areas with moderate PCB concentrations. - Placement of a thin-layer of clean substrate to enhance natural recovery in peripheral areas - Effectiveness Monitoring.

NARR Comments: [12/9/10 SAM/SA] Metro Metals discharges stormwater to the East Whitaker Ponds. High metal concentrations were found during routine stormwater sampling for their stormwater permit. In 2008 Metro Metals installed a stormwater treatment system, which appears to be working as designed based on COLS-1200 permit data, but sediments near the former discharge may contain elevated levels of metals or other pollutants from historic stormwater runoff.

NARR Comments: [5/23/11 SAM/SA] Metro Metals submitted work plan to evaluate sediments near outfall in East Whitaker Pond. [7/12/11 SAM/ICP] DEQ approved work plan to evaluate sediments near outfall in East Whitaker Pond. This stormwater work plan also covers the former Coast Crane parcel ECSI #1225. [11/23/11 SAM/VCP] Metro Metals submitted data from sediment evaluation. The historical outfall(OF3) data indicates significant concentrations of metals and PCBs at the surface(0-10cm) and appears to decrease at depth(30cm). Next steps will evaluate extent of metals and PCBs. [12/6/12 SAM/VCP] Evaluation of extent of metals and PCBs in sediments underway. Metals appear to decrease with distance from outfall, however PCBs are still at concentrations of concern and additional sampling is planned. [4/30/2014 SAM/VCP] A streamlined Feasibility Study will be prepared to assess potential remedial actions for the contaminated sediment. [7/28/15 SAM/VCP] Metro Metals submitted a Revised Feasibility Study on February 5, 2015. The proposed alternative includes Partial Removal, Enhanced Monitored Natural Recovery, and Activated Carbon Amendment in selected areas East Whitaker Pond. [11/3/15 SAM/VCP] DEQ is proposing cleanup action for East Whitaker Pond. The proposed remedial action includes a combination of soil removal, dredging of contaminated sediments and placing a thin layer of clean material across the majority of the pond. In some locations, the clean material will include an activated carbon amendment. Confirmation sampling and long-term monitoring is proposed to evaluate the effectiveness. [2/1/16 SAM/VCP] Record of Deicsion(ROD) Completed 1/29/16. The selected remedial action consists of the following elements: Excavation of sediment and soils with relatively higher concentrations of contaminants of concern. Placement of activated carbon in areas with moderate PCB concentrations. Placement of a thin-layer of clean substrate to enhance natural recovery in peripheral areas Effectiveness Monitoring. Based on public input, the remedy was expanded to include addtional evaluation of sensitive species, clarification of removal extent and activated carbon placement. [6/8/16 SAM/VCP] DEQ currently negotiating a Consent Judgment with Metro Metals to continue with the remedial design and action phase of the project. [11/8/17 SAM/VCP] DEQ entered into a consent judgment with Metro Metals Northwest, Inc on October 5, 2017. The Consent Judgment outlines DEQ s oversight of remedial design and cleanup of East Whitaker Pond sediments and adjacent soil and wildlife habitat improvement. The consent judgment also includes settlement of Metro Metals potential liability for contribution to sediment contamination in the Columbia Slough and satisfaction of liability associated with State of Oregon natural resource damages to Whitaker Ponds and the Columbia Slough. [4/17/2018 VCP/SAM] DEQ approved the Final Remedial Design/Remedial Action Work Plan March 27, 2018.

NARR Comments: [7/14/11 SAM/SA] This site was used for agricultural purposes until about 1990 when Riedel Environmental Services developed a processing and composting facility. MetroMetals, a scrap metal recycling facility, has operated on the site since 1992 and aquired the adjacent Coast Crane parcel(ECSI#1225) in 2006.

Description Of The Avg Qnty Code:	1,000-4,999
Most Hazardous Ingridient:	OXYGEN
United Nations/north America 4 Digit Class Number:	1072
Hazard Rank:	2
EHS Ingredient:	NONE LISTED ON SDS
Substance Pure:	True
Substance Mix:	False
First Hazardous Class Code For Chemical:	Oxidizers
Second Hazardous Class Code For Chemical:	Non-flammable Gas
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	5.1
Hazard Class 2 Of The Chemical:	2.2
Hazard Class 3 Of The Chemical:	Not reported

Chemical:

Chemical Name:	OXYGEN
United Nations/north America 4 Digit Class Number:	1072
Chemical Abstract Service Identifier Number:	7782447
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Oxidizers
Second Hazardous Class Code For Chemical:	Non-flammable Gas
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	5.1
Hazard Class 2 Of The Chemical:	2.2
Hazard Class 3 Of The Chemical:	Not reported
Chemical Is A Toxic 313 Chemical:	N
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	N
Fertilizer:	N
Pesticide:	N
Contains 313:	N

METRO METALS NW INC (Continued) **S108661214**

NARR Comments: (Matt McClincy 1/9/91) In October 1990, a surface spill of bunker fuel occurred at the Horizon Air facility (Portland International Airport). Horizon Air retained Spencer, Inc. to clean up the spill. During the removal, Spencer identified soil that it interpreted as contaminated with bunker fuel from past spills at the site. Cleanup of soils affected by the contemporaneous release was completed. Some of the soil impacted from past spills was also removed. At this time,

SOIL CONTAMINATION - NE TRANSPORT WAY (Continued) **S103303316**

DEQ is unaware of plans to remove the remaining contaminated soil at the site.

COLWOOD NATIONAL GOLF COURSE- NORTH (Continued) **S116734836**

Decode for NarcdID: Remedial Action
NARR Comments: [4/8/2014 SA/SAM] The northern section of Colwood Golf Course(north of Cornfoot Rd) is being reviewed by DEQ as a part of a prospective purchaser agreement. [4/18/2014 SA/SAM] A phase I environmental site assessment found two recognized environmental concerns: 1- the use of fungicides, herbicides and pesticides may have impacted soils on property and off-site sediments in McBride and Columbia Sloughs. 2-a shallow infiltration pipe along fairway 13 should be removed or registered as a underground injection control with DEQ. Shallow soil samples were collected in 2006-pesticides/herbicides were not detected above analytical reporting limits. Metals were consistant with background concentrations, except for one mercury sample(0.9mg/kg vs background at 0.2mg/kg). A sediment sample was collected in the onsite pond. Metals were consistant with background. pesticides and herbicides were not detected above method reporting limits except for 4,4 DDE at 27ug/kg. [10/30/14 SA/SAM] Previous sediment samples collected in the McBride Slough[ECSI#5676] were above risk-based screening levels for pesticides and metals. The sampling did not determine the source of the contaminants, but it is possible that golf course maintenance activities have contributed to contamination in McBride Slough and similarly may have contributed to contamination in the Columbia Slough to the south. Trammell Crow Portland Development, Inc. has agreed to: make a contribution to the Columbia Slough sediment investigation and remediation cleanup fund; prepare and comply with a contaminated media management plan for construction activities on the property; and conduct appropriate building/infrastructure demolition, abandonment, removal and disposal per county, state and federal guidelines for septic systems, wells and asbestos containing materials. and conveyance of parcel 2(approximately 2 acres) to the Port of Portland. The consent judgment will provide Trammell Crow Portland Development, Inc. with a release from liability for claims by the State of Oregon under state law regarding existing hazardous substance releases at or from the property. The consent judgment will also provide Trammell Crow Portland Development, Inc. with third party liability protection. [8/22/16 ICP/SAM] DEQ signed and recieved a notice of transfer from Trammell Crow to US Postal Service on August 16, 2016. The USPS will continue to comply with the terms of the PPA. [7/13/17ICP/SAM] DEQ is preparing to certify that all actions required have been satisfactorily completed. This project has resulted in both environmental and economic benefits. Tramell Crow prepared a construction completion report in October 2016. Trammel Crow contributed to DEQ s Columbia Slough remediation account on December 15, 2014 and transferred Parcel 2 to Port of Portland on October 17, 2014. A draft staff report also proposes the redevelopment work meets the objectives for No Further Action. 10/26/17 No public comments recieved on staff report; NFA and Certificate of Completion issued.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

NARR Comments: (11/91 MJM/VCS) In the past, the Riedel - MECO site has been primarily used by owners of heavy equipment dealerships. Soil sampling conducted by Riedel Environmental Serivces (RES), for geotechnical purposes, identified oil and diesel contamination in the northwestern portion of the MECO site. According to interviews conducted by Riedel, it is believed that a large amount of fill material was deposited in this area over the years. During 12/90, RES soil excavation identified 2 distinct levels of contamination. The upper level consisted of an oiled rocky subgrade from the surface to a depth of 5 feet. From 5 feet to 17 feet, buried equipment debris and oil were present. RES removed all contaminated soil below the 5 foot level. Groundwater entered the excavation at 17 feet. Prior to excavation, a water sample taken from a previously existing monitoring well on the north margin of the excavation did not contain petroleum hydrocarbons. However, it was not specifically designed to detect groundwater impacts from the petroleum hydrocarbon contaminants present in the soil.

Updated Date: 04/25/2012
Decode for NarcdID: Remedial Action
NARR Comments: (11/91 MJM/VCS) Riedel entered into a letter agreement with VCS 3/91 to review the hydrocarbon contaminated soil removal and to identify additional site work that might be needed. Several project issues then led to the site being placed on hold by VCS, and project closeout was completed 12/31/92. (6/7/94 GMW/SAS) Riedel removed most of the deeper hydrocarbon contamination in 1990. As a result, this is a low priority for further assessment and remediation. SAS recommends

SPARKS-WAGNER INC (Continued) **U000433007**

that the property owner of the former MECO site sample well #10 on a regular basis to ensure that heavy hydrocarbons remaining in the soil are not migrating into groundwater. (11/12/97 LSK) Site reevaluated as part of review of all sites within the Columbia Slough Study Area. Located south of Whitaker Slough. [5/26/11 SAM/SA] Metro Metals Northwest is completing a stormwater outfall sediment assessment, which includes this property. See ECSI#5455 for more information.

NARR Comments: (6/7/94 GMW/SAS) Residual hydrocarbon contamination in the northwest portion of the former MECO site exceeds DEQ's matrix cleanup level of 500 ppm in some areas. These shallow hydrocarbons may have resulted from parking lot oiling, and there is no evidence that the oiled layer contains VOCs, PCBs, PAHs, or significant concentrations of metals.

NARR Comments: (12/27/93 KPD/SAS) Columbia Woodworking was a lumber mill that operated at the site for an unknown length of time. The exact layout of buildings and other facilities at the site is also unknown. Prior to 1962, the site was used to make square cut lumber. That year, the company added wood treating to its operations. The wood was pressure treated in two retorts. Contaminated steam was condensed, collected, then apparently discharged into an on-site pond. Other wastewaters and preservatives were also allegedly discharged into the pond. After extracting the recoverable preservatives, water from the pond was then discharged into three on-site drywells. Treated lumber may have been allowed to drip dry over bare ground in a storage area on the western edge of the site. In 1969, the site was sold to Schiewe Trust. Within a year, all of the buildings were razed, and the drywells and pond filled in. The trust paved over most of the site and built two warehouses. A 1984 federal Preliminary Assessment (PA) concluded that no further federal action was needed, considering the high degradation rate of the preservatives. However, after completing its own PA in 1991, DEQ decided further investigation at the state level was needed.

NARR Comments: There is a 70' deep irrigation well northeast of the site. The well owner had complained to DEQ of a strong creosote smell in the well water. DEQ sampled the well in 1970 and again in 1979, but did not detect creosote. (The well owner reported that the creosote odor disappeared a year after the site closed). Groundwater is approximately 45 feet deep at the site. The site is 3000 feet from the Columbia Slough.

NARR Comments: (6/30/91 JMO/SAS) Basic PA completed, further action is needed. More background research is needed to confirm the locations of the retorts, drywells, and storage tanks. Soil and groundwater should be sampled. (10/24/97 LSK) Site reevaluated as part of review of all sites within the Columbia Slough Study Area. The site is located aout 3000 feet south of the Whitaker Slough.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

NARR Comments: Unknown. [10/30/14 SA/SAM] a ditch runs along the northern border of the western neighbor 5327 NE Columbia Blvd ECSI# 5903 under heavy blackberries and may extend to the Moody property. The end discharge location was not visible due to the heavy blackberry brush, but possibly flows towards the East Whitaker Pond.

Updated Date: 12/17/2002
Decode for NarcdID: Contamination
NARR Comments: (12/28/88 DAB/SAS) Allegedly, the Guard created a shallow landfill in the 1950s and 60s on land now owned by the Port of Portland. The landfill was near the airport and was believed to occupy an area of 750' x 300'. No information is available to characterize or quantify wastes disposed of at the landfill (however, wastes would most likely have included oil, sulfuric acid, solvents, enamel paint, xylenes, acetic acid, and photographic chemicals). In 1986, the Port of Portland hired a consultant to evaluate the environmental condition of the area. High levels of lead were found in sediment from a drainage ditch, and lead, cadmium, and chromium were found in shallow groundwater.

Updated By: MPUGH
Updated Date: 03/14/2005
Decode for NarcdID: Remedial Action
NARR Comments: (12/28/88 DAB/SAS) As a result of the Port of Portland’s discovery of contaminated sediments in a drainage ditch, the Port removed about 800 cubic yards of sediments, using <quot>sight & smell<quot> standards to determine the limits of contamination. The Port then placed up to 18 feet of dredge fill over this cleanup area, as part of an airport expansion project. Ten to 18 feet of fill were also placed over the former landfill area. Groundwater contamination may remain if organic and inorganic chemicals from the buried landfill continue to act as a source area. (9/15/95 DMC/SAS) In 1989, EPA completed a Site Inspection and determined that the site would not be eligible for inclusion on the NPL. Therefore, EPA determined that it

OREGON NATIONAL GUARD - PDX AIRPORT #1 (Continued) **S105613710**

would take no further federal action. (2/18/98 LSK/SAP) Strategy Recommendation completed as part of re-evaluation of sites within the Columbia Slough Study Area. Additional soil sampling and groundwater monitoring recommended as a medium priority. (1/21/01 MJM/VCP) Port of Portland entered DEQ Independent Cleanup Program (ICP) in January 2000 and is proceeding with additional site investigation. 3/14/05 MTP. DEQ anticipates that a final site investigation and risk evaluation report will be submitted in 2005.

NARR Comments: Prior to 2007, site wastewaters are believed to have been directed to as many as 2 on-site cesspools and up to six on-site drywells. In 2007, site wastewaters were redirected to the city sanitary sewers. However, some of the site stormwater runoff appears to drain to a city catchbasin along the southern edge of NE Columbia Boulevard. This catchbasin drains to a sump located beneath NE Columbia Boulevard. It is not known if the site drywells and cesspools are still present, or whether some of the site's wastewaters may still discharge to these.

NARR Comments: The site iwas constructed over shallow alluvium, and was not serviced by the municipal sanitary sewers until 2006. City plumbing records indicate that the site had up to six on-site drywells and up to two on-site cesspools. It is not known if the cesspools and drywells have been decommissioned, or whether sludges, contaminated soils, and/or contaminated groundwater may be associated with them. There is recent photogragraphic evidence of site runoff entering a city-owned catchbasin along the southern edge of NE Columbia Boulevard. This catchbasin feeds a sump located beneath NE Columbia Boulevard. It is not known if current or past site activities may have contaminated local alluvium or groundwater.

Decode for NarcdID: Water Use (Current/Reasonably Likely)
NARR Comments: The site lies within 0.5-mile of the Wellhead Protection Area for Portland Water Bureau's Columbia South Shore Wellfield. PWB has 8 community water supply wells within 1.25- to 2.0 miles downgradient from the site. The nearest domestic well is located at the Oregon Fresh Farms facility, located directly downgradient, across NE Columbia Boulevard, from the site. This well has historically been used for washing fresh produce prior to marketing. Future use of the well is not known. One irrigation well is also located at the Oregon Fresh Farms site; two or three irrigation wells are located somewhat farther downgradient at the Colwood National Golf Course. Whitaker Slough and Columbia Slough are located between Oregon Fresh Farms and the Colwood National Golf Course. Both sloughs are known to have sediment contamination which may be adversely affecting aquatic life.

Decode for NarcdID: Contamination
NARR Comments: (7/14/93 KPD/SAS) Carson Oil Company was refilling an above-ground storage tank with diesel in May 1991 when the hose connection ruptured. Approximately 250 gallons of diesel spilled onto the ground. Most was sopped up. However, one of eight confirmation samples found high levels of TPH. Further sampling in the area found a degraded heavy oil, two feet below ground, along with an oil filter, lube pan, air filter, and hydraulic lines, but no diesel. In correspondence, DEQ agreed that the diesel spill appeared to be cleaned up and that the observed contamination appeared to be the result of past practices at the site.

NARR Comments: (7/14/93 KPD/SAS) The known contamination apparently has not been removed. Site Assessment recommends that the site owner/operator enter the Voluntary Cleanup program (VCP). If the owner/operator does not enter the VCP, Site Assessment recommends that a basic state Preliminary Assessment (PA) be performed to determine the history of waste disposal activities on-site. Because the known contamination is limited in extent, Site Assessment recommends that the PA be given a low priority. (11/10/97 LSK) Site re-evaluated as part of review of all sites within the Columbia Slough Study Area. Located south of the Lower Slough.

NARR Comments: (6/3/92 AGG) On 7/5/89 a fire occurred at 5411 NE Portland. The fire spread to nearby buildings and to a large pile of tires (approximately 20,000). Runoff water from fire fighting may have spread pyrolytic oil contamination to soil on-site. Several buildings and burnt tires were removed in 1989.

Description: Portland Air Base, FUDS Property Number F10OR0538, is located in Portland, Multnomah County, Oregon. The FUDS is at the present-day Portland International Airport. The FUDS includes 1,083 land acres and is positioned in four separate land parcels located in Township 1 North, Range 1 East, Section 1, and Township 1 North, Range 2 East, Sections 5, 6, 7, 8, 17, and 18.Two MRSs, the Shoot-in Butt MRS and the Burial Site MRS, have been identified at Portland Air Base.
Current Program: Not reported
History: Construction of the Portland-Columbia Airport at the location of the Portland Air Base FUDS property was begun as a Works Progress Administration project in 1936, and the facility was opened by the Port of Portland as a commercial airport late in 1940 (Port of Portland, 2011). In August and September of 1940, the Army developed plans identifying Portland as one of several municipal airports to be used as tactical air bases, and in the first half of 1941 began operations at Portland Army Air Base (later known as Portland Air Base). Army expenditures were used to widen runways and construct additional taxiways and lighting. The air base was expanded in 1942, when land for a cantonment area and ammunition storage point was acquired. Throughout its life as a military air base, commercial air traffic continued as the airport facilities were shared with the Portland Airport.During World War II, Portland Air Base was used to train fighter pilots and also served as a base for coastal defense. The base was initially assigned to the Second Air Force, but Army reorganization resulted in the Fourth Air Force assuming control of the base on January 26, 1942. Historical documentation included in the ASR indicates that the 432nd Army Air Force Base Unit, activated in April of 1944, was the largest unit on base, with a primary mission of training replacement fighter pilots for overseas duty. The ASR reports that the training mission of the air base was reduced in 1944, with increased emphasis on aircraft repair, and that by November 1944, the primary mission was operation of an aircraft modification center. On March 8, 1945, Headquarters of the Fourth Air Force placed Portland Air Base on a reduced mission status, operating as a repair depot and modification center for P-38 aircraft. By the end of 1945, the base was in the process of closing, and its primary mission was discharging servicemen.

NARR Comments: (5/1/1998 LSK/SAS) The Sulzer Escher Wyss facility repairs paper making machinery and performs other light industrial work. Incoming parts are steam cleaned or dipped in a hot tank and then steam cleaned. The facility has been on the site for almost 35 years. The company received a Notice of Noncompliance (NON) from DEQ in February 1995 for a storm water discharge violation based on pH. The facility has generated hazardous waste in the past in the form of waste coolant sludge and tank sludge containing chromium and lead. A small waste oil spill occurred in September 1993. It is reported that no oil was spilled beyond a pavement area. (04.23.14 EKM) The Halton Company purchased the property in 2005, also known as the Halton East Campus. The Halton Company entered the DEQ voluntary cleanup program in June 2011 and a Consent Judgment with DEQ in 2012 to resolve in-water contamination related to the Columbia Slough. Halton Co. intends to investigate environmental contamination at their Main Campus and East Campus (formerly known as Sulzer or Voith)

HALTON CO (Continued) **1004769828**

properties, and conduct a source control evaluation. DEQ approved a stormwater source control evaluation work plan for the Halton Properties in April 2013. Conducting stormwater sampling initiated spring 2013. DEQ approved a Remedial Investigation Work Plan in April 2014.

NARR Comments: Sulzer Escher Wyss is located south of the Whitaker Slough and east of the Buffalo Slough. Sampling of Slough sediments by the City of Portland has identified elevated levels of lead and chromium in the Whitaker Slough and elevated levels of chromium in the Buffalo Slough. A Nov. 1991 storm drainage plan for the Sulzer site shows two drain outfalls to the Columbia Slough, one of which is a private storm drain that leaves from two different site buildings. A storm water discharge permit was issued to Sulzer Wyss in October 1993.

NARR Comments: (5/1/98 LSK/SAS) Available information documents that metals such as lead and chromium have been part of the waste stream at the Sulzer facility. There is no documentation of spills or illegal releases other than one oil spill to asphalt ,which appears to have been addressed, and the NON for a violation of pH. There are some inconsistencies in reporting of TCLP results for coolant sludge and a lack of information about how coolant sludge and waste from the hot tank may have been disposed. While contaminants found in the Slough, lead and chromium, were present in waste generated at the Sulzer

HALTON CO (Continued) **1004769828**

facility, there is no documentation of releases to the Slough from the site -- other than low levels of copper and zinc identified at part of one stormwater sampling event. On the other hand, wastewaters containing chromic acid were released to four deep dry wells on the immediately upgradient AB Finishing Tech site (ECSI #871) from at least 1972 until 1990. A drinking water well used by AB Finishing was sampled in 1988 and contained chromium at 265 ug/l. Sampling of the well in 1993 found 18 ug/l total chromium and 20 ug/l hexavalent chromium. The Sulzer Escher Wyss site is recommended for no further action. This recommendation could change and additional site investigation could be considered if future sampling in the Columbia Slough indicates concerns that may be related to this site. Additional information should be requested on past practices, including the use of storm drains. (04.23.14 EKM) The Halton Company entered the DEQ voluntary cleanup program in June 2011 and a Consent Judgment with DEQ in 2012 to resolve in-water contamination related to the Columbia Slough. Halton Co. intends to investigate environmental contamination at their Main Campus and East Campus (formerly known as Sulzer or Voith) properties, and conduct a source control evaluation. DEQ approved a stormwater source control evaluation work plan for the Halton Properties in April 2013. Conducting stormwater sampling initiated spring 2013. DEQ approved a Remedial Investigation Work Plan in April 2014.

NARR Comments: [June 2017] DEQ has determined no No Further Action is required for Halton Voith site (ECSI #1503) and Halton Co. site (ECSI #121) subject to conditions. The Halton Co. completed a remedial investigation and source control evaluation, under a Voluntary Cleanup Agreement with DEQ. In 2012, the Halton Co. also entered into a settlement with DEQ to resolve liability for contribution to contamination of Whitaker Slough and Ponds from the properties. The source control evaluation performed included stormwater monitoring and site improvements to remove and control contaminant sources. The evaluation and actions, in addition to payment into DEQ s settlement account, fulfill requirements of the 2012 settlement.

 At the Halton Voith site, residual contamination will managed through institutional controls. Institutional controls include implementing a contaminated media management plan during subsurface work, ongoing stormwater controls, and restrictions on groundwater use. The DEQ Staff Memorandum in support of a Conditional No Further Action determination presents the basis in greater detail for DEQ s recommended CNFA and can be downloaded from this website (see below), in addition to other site documents.

Site Control:
Site Control #: 1115
Control Number: 3
Begin Date: 06/14/2017
End Date: Not reported
Frequency Of Review: 60
Last Reviewed By: E. McDonnell, DEQ

HALTON CO (Continued) **1004769828**

Last Reviewed Date: Not reported
Last Update By: GWISTAR
Last Updated Date: 06/15/2017
Site Comment: DEQ s conditional NFA requires institutional controls to ensure continued protection of occupational workers and ongoing stormwater management controls. Required institutional controls include: a) implementation of the Contaminated Materials Management Plan; b) maintenance of caps and covers; c) restriction on groundwater use; and d) long-term stormwater management for continued source control. These control requirements have been incorporated into an Easement and Equitable Servitude (EES) for the Halton Co. site and recorded with the property deed. See also ECSI #121.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Decode for NarcdID: Land Use (Current/Reasonably Likely)
NARR Comments: A Land and Beneficial Water Use Survey for the Portland International Airport was prepared by the Port, reviewed by DEQ and finalized in August 2004. The reasonably likely future land use of the airport and adjacent Port-owned properties is expected to remain airport-related, commercial and industrial. The Port expects that Airport facilities will be upgraded and expanded to meet increasing needs. Based on the area-wide survey, use of the uppermost aquifer for drinking water is not a current or reasonably likely beneficial water use for the site. Beneficial water use for the shallow aquifer at the site is primarily recharge of surface water. Shallow groundwater flow is generally toward teh south in the direction of the Columbia Slough. The Slough is approximately 300 feet south of the site.

NARR Comments: (11/5/02 AC/SRP) Entered the Independent Cleanup Pathway program in October 2002. In accordance with the agreement, DEQ provided Site Specific Technical Consultation during the investigation of hazardous substances at the site. DEQ concludes that based on the information presented to date, the Port of Portland Ground Run-Up Enclosure site is currently protective of public health and the environment and requires no further action under the Oregon Environmental Cleanup Law, unless new or previously undisclosed information becomes available.

NARR Comments: The site is part of the Portland International Airport facilities located in northeast Portland. The airport is roughly bound by the Columbia River on the north, Interstate 205 on the east, the Columbia Slough on the south and NE 33rd Drive on the west. The Ground Run-Up Enclosure (GRE) is part of the Airtrans Center, which provides air cargo and air maintenance services. Several Oregon Air National Guard (OANG) building, underground fuel storage tanks, and electrical transformers formerly occupied the site.

NARR Comments: Use of an Underground Injection Control (UIC) system for disposal of water from steam-cleaning of forklift bodies and motors was noted around the year 2000. Site assessment activities discovered petroleum hydrocarbon and lead contamination in sludge in the UIC. Also diesel fuel observed in groundwater at SW corner of the site.

NARR Comments: (5/1/07 MGreenburg/ICP) Following the discovery of UIC contamination, remedial actions included the removal of material from the UIC and investigation of soil and groundwater in the vicinity. Groundwater contamination in the vicinity of the UIC location appears to be localized, and does not pose a threat to human health or the environment. DEQ reviewed the information for the site and summarized its findings in a File Memorandum dated February 21, 2007. The File Memorandum recommended a partial no further action (PNFA) for the UIC portion of the property. DEQ provided a public comment period from April 1 to April 30, 2007, to announce the proposed partial NFA determination. No comments were received by DEQ. Therefore, no further action is required for the UIC area at this site under the Oregon Environmental Cleanup law, ORS 465.200 et. seq., unless additional information becomes available that warrants further investigation. Other observed groundwater contamination at the site

FORKLIFT SERVICES OF OREGON (Continued) **S111249649**

(diesel fuel) is not part of this evaluation and needs additional investigation.

NARR Comments: (1/4/08 PS/CU&ER)At the direction of OPERF, AMEC collected and analyzed representative samples of settled dust deposited throughout the interior portions of the AMC hangar complex on multiple occasions from October 2006 to February 2007. Testing results indicated that accumulations of settled dusts inside the complex contained elevated concentrations of chromium and detectable concentrations of other toxic metals including lead, cadmium, and hexavalent chromium. The highest metals concentrations were detected in the North Hangar, where the largest deposits of settled dust were observed. Large deposits of friable metals-containing dusts were also observed in the process air handling ducts and exhaust stacks in the North Hangar. Interior spaces were subsequently remediated as a condition of the lease agreement with the Port. Boeing reached an agreement with the Port to lease the AMC Property immediately following the end of OPERF s lease in April 2007. As part of their baseline assessment of the property, Boeing s environmental consultant, Landau Associates (Landau), collected sediment samples from the Columbia Slough adjacent to the property s stormwater outfall during two events. AMEC collected and analyzed splits of the sediment samples. On January 24, 2007, Landau collected a sediment sample from the concrete pad directly below the stormwater outfall. Concentrations of total cadmium, chromium, copper, lead, and zinc detected in AMEC s split of this sample exceeded Department of Environmental Quality (DEQ) Columbia Slough baseline concentrations. A sediment sampling event occured on February 1, 2007 to assess the columbia slough of of the stromwater outfall. sampled were collected mid-channel (15-20 feet south of the north bank) surface sediment (to a depth of 10 centimeters) at three locations; (1) approximately 25 feet east [upstream] of the outfall; (2) adjacent to the outfall; and (3) approximately 25 feet west [downstream] of the outfall. AMEC split samples collected adjacent to and downstream from the outfall (locations 2 and 3, above) had selected total metals concentrations that exceeded Columbia Slough baseline values. All total metals concentrations detected in the AMEC split sample collected upstream of the outfall (location 1, above) were below Columbia Slough baseline concentrations (AMEC, 2007c). In agregate, the available information suggests some level of impact to sediment, which requires further evaluation. Recent (2017) information indicates that perfluorinated compounds have been released at the site. Followup investigation is being considered. Data from 2006 indicate the detection of PFOA and APFO in both groundwater and sediment in an on-site detention pond.

NARR Comments: The AMC Property and vicinity were primarily rural residential and agricultural in use until the1950s. A small restaurant/tavern was located on the southeast corner of the AMC Property from the 1950s until the early 1990s. Mount Hood Metals, an automobile wrecking yard and a metal recycling facility, operated on the southwest portion of the AMC Property between the 1960s and 1989. Between the mid-1960s and 1991, the Port of Portland (Port) acquired ownership of the individual property parcels that comprise the AMC Property. By 1992, all historical buildings had been removed. Construction of the aircraft hangar complex and associated fire suppression facilities that currently occupy the AMC Property was completed in 1993. The original tenant for whom the hangar complex was constructed, the Pacific Aircraft Maintenance Corporation (PAMCO), became insolvent shortly after the facility opened in late 1993. As a consequence of providing financial support to the original and now defunct lessee, the Oregon Pubic Employees Retirement Fund (OPERF), acting through the Office of the Oregon State Treasurer, assumed responsibility for operation and management of the AMC Property. OPERF entered into a lease agreement with the Port on December 31, 1996 and subsequently subleased the AMC property to several subtenants that primarily used the property for aircraft painting, maintenance, and storage. The primary subtenant performed aircraft painting operations in the North Hangar of the facility, from approximately 1998 to February 2007. In 2005, OPERF began negotiations with the Port to terminate their lease of the AMC Property. In April 2006, AMEC Earth & Environmental, Inc. (AMEC) was retained by OPERF to assist in meeting their environmental due diligence obligations associated with the lease termination. AMEC performed a series of due diligence activities at the AMC Property. A bibliography listing documents prepared by AMEC and relevant prior environmental reports and documents prepared by others is included in Attachment B to this Agreement. Summarized below are prior assessment and remedial activities, which directly apply to the proposed Slough investigation. In October 2006, AMEC conducted a Phase II Environmental Site Assessment (ESA) at the AMC Property to determine whether OPERF subtenant operations had impacted AMC Property soil or groundwater. The Phase II ESA included sampling of surface soil, groundwater, stormwater catch basin sediment, and fire suppression detention pond sediment. It should be noted that, due to insufficient

AVIATION EXTERIORS (Continued) **1000795787**

sediment volume, AMEC was unable collect samples of sediment from the AMC Property s storm sewer system, which discharges to the Columbia Slough, as originally proposed in the ESA work plan. Samples were analyzed for selected metals, volatile and semi-volatile organic compounds, and petroleum constituents. Based on the results of the Phase II ESA analytical testing, AMEC concluded that subtenant operations had not significantly impacted soil or groundwater.

NARR Comments: (January 2009) DEQ's NFA applies only to off-site Columbia Slough sediments, not to the site itself. In 2017, a preliminary assessment was completed for airport properties to identify locations where fire-fighting chemicals, specifically AFFF, where stored or use. According to the report, An underground release of AFFF occurred shortly after the PAMCORP hanger was constructed in 1993. An unknown quantity of material was released. Foam was also discharged on two separate occassions with the hangar in the mid-1990s. A fire incident resulted in the release of up to 60,000 gallons of AFFF foam, while a sensor malfunction released up to 30,000 gallons. The majority of foam from both incidents was collected in detection ponds prior to discharge to the City of Portland sanitary sewer system. DEQ Cleanup is currently considering followup investigation at the site for perfluorinated compounds associated with AFFF incudling PFOS and PFOA. An additional foam release occurred in 2018. Based on this series of releases and the likelyhood of environmental impacts (soil and groundwater), DEQ will proceed with identification of the site as a medium priority for further investigation.

Description Of The Avg Qnty Code:	500-999
Most Hazardous Ingridient:	2-AMINO-2-ETHYL PROPANEDIOL
United Nations/north America 4 Digit Class Number:	0000
Hazard Rank:	2
EHS Ingredient:	NONE LISTED ON SDS
Substance Pure:	False
Substance Mix:	True
First Hazardous Class Code For Chemical:	Acute Health Hazard
Second Hazardous Class Code For Chemical:	Combustible Material
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	6.3
Hazard Class 2 Of The Chemical:	4.5
Hazard Class 3 Of The Chemical:	Not reported

Chemical:

Chemical Name:	ARDROX 6489A
United Nations/north America 4 Digit Class Number:	0000
Chemical Abstract Service Identifier Number:	115708
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Acute Health Hazard
Second Hazardous Class Code For Chemical:	Combustible Material
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	6.3
Hazard Class 2 Of The Chemical:	4.5
Hazard Class 3 Of The Chemical:	Not reported
Chemical Is A Toxic 313 Chemical:	N
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	N
Fertilizer:	N
Pesticide:	N
Contains 313:	Y

Chemical Name:	WHITE ALLIPHATIC URETHANE ROOF TOPCOAT
Physical Description:	LIQUID
Case Number:	13463677
Facility Id:	110433
Physical State Of The Substance:	2
Avag Amt Possessed During Year CD:	20
Max Amt Possessed During Year CD:	20
Applicable Unit Of Measure Code:	2
Description Of The Unit Of Measure:	GALLONS
Type Code:	D
Description:	STEEL DRUM
Type Code:	Not reported
Temperature Description:	Not reported
Pressure of Code:	1
Pressure Description:	NORMAL PRESSURE
Pressure of Code:	Not reported
Pressure Description:	Not reported
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	Not reported
Temperature of The Hazardous Substance Code:	Not reported
Days Hazardous Substance On Site During Year:	2
Is The Substance Protected A Trade Secret:	False
Description Of The Max Qnty Code:	1,000-4,999

AVIATION EXTERIORS (Continued) **1000795787**

Description Of The Avg Qnty Code:	1,000-4,999
Most Hazardous Ingridient:	TITANIUM DIOXIDE
United Nations/north America 4 Digit Class Number:	1263
Hazard Rank:	2
EHS Ingredient:	Not reported
Substance Pure:	False
Substance Mix:	True
First Hazardous Class Code For Chemical:	Acute Health Hazard
Second Hazardous Class Code For Chemical:	Chronic Health Hazard
Third Hazardous Class Code For Chemical:	Flammable and Combustible Liquid
Hazard Class 1 Of The Chemical:	6.3
Hazard Class 2 Of The Chemical:	6.4
Hazard Class 3 Of The Chemical:	3.0

Chemical:

Chemical Name:	WHITE ALLIPHATIC URETHANE ROOF TOPCOAT

Created By: Not reported
Created Date: 12/17/2002
Updated By: GWISTAR
Updated Date: 06/25/2003
Decode for NarcdID: Contamination
NARR Comments: (8/7/00 MTP/SAP) On February 23, 2000, unusual operating conditions in an oil delivery system prompted testing of the line with a helium tracer. The system consists of a 5/8 inch diameter PVC line conveying heavy oil from a 500-gallon above-ground storage tank (AST) near a remote pump island. A leak was discovered in the line near a pump island. Petroleum hydrocarbon analysis confirmed the presence of heavy oil. Subsequently, a total of 170 gallons of oily water, and 10 tons of impacted soil were removed from the release area. The depth of the excavation was 8 feet; depth to groundwater is about 5.5 feet below ground surface (bgs). Soil and groundwater sampling showed the heavy oil contamination was localized in the release area. The most impacted material was the pea gravel used as backfill in the pipeline trench, as underlying silt appeared to have limited vertical migration. Relatively low levels of diesel (2.21 ppm) and heavy oil (0.722 ppm) were detected in groundwater sample (GP-1) collected about 20 feet south of the release point. Polynuclear aromatic hydrocarbons (PAHs) were not detected in one groundwater sample (GP-3) analyzed, where diesel was detected at 0.943 ppm. Groundwater flow direction was not indicated, although it is likely to the south towards the Columbia Slough. PAHs were not analyzed for in GP-1, although this sample had the highest petroleum level. Approximately 5 cubic yards of impacted soil with concentrations up to 19,100 ppm heavy oil remain in place; this soil was not removed due to structural integrity concerns for the pump island and canopy structure.

NARR Comments: The release occurred in a 5/8-inch diameter PVC line conveying heavy oil from a 500-gallon above-ground storage tank (AST) near a remote pump island. The release was suspected initially on February 23, 2000, and the leak confirmed on March 1, 2000. It was reported that 20 gallons of motor oil were released.

Decode for NarcdID: Pathways & Other Hazards
NARR Comments: Possible migration of impacted shallow groundwater to the Columbia Slough. The site is located between two east-west trending segment of the Columbia Slough. Several unnamed drainages in the area flow to the Columbia Slough, including a north-south trending drainage that appears to be in the vicinity of the sanitary sewer release. The Columbia Slough is water-quality-limited (303d listed) for toxics, due primarily to lead in the water column, and pesticides and polychlorinated biphenyls (PCBs) in fish tissue. DEQ considers 303d-listed water bodies as Vulnerable Areas. DEQ's Water Quality Division has developed Total Maximum Daily Load requirements (TMDLs) within the Columbia Slough for these contaminants.

Released:
Release Behavior Id: 3889
Incident Id: 910208
Behavior: 4

Narrative:
Narrative Id: 3319
Incident Id: 910208
Incident Narrative: RESPONDED AT REQUEST OF PORT OF PORTLAND FIRE DEPT. USED LIME TO NEUTRALIZE 20 GALLONS OF ALUMINUM SULFATE SPILLED ON GROUND. NEUTRALIZED MATERIAL PLACED IN OVERPACK DRUMS AND LEFT WITH PORT FOR DISPOSAL.
Incident Date: 5/30/1991

Updated Date: 11/25/2005
Decode for NarcdID: Contamination
NARR Comments: (5/6/2003 DAB/SRS) Nu-Way Oil Company re-refined motor oil and other used oils at the site for over 50 years. Oily sludges and wastewaters were disposed of in an unlined lagoon, and other wastes were spread on the ground. There was evidence of spills and leaks, and liquid wastes from the lagoon were used for dust control on-site. Contaminants included petroleum hydrocarbons (waste motor oil), lead, chromium, chlorinated solvents, and low levels of PCBs and pesticides. Soil and groundwater were impacted, as well as sediments in the adjacent Whitaker Slough.

NARR Comments: The selected cleanup plan for the property has been implemented. Some of the hot spot soils were removed from the site and disposed off-site. Hot spot soil remain on site particularly in the production area on the east side of the property. A soil cap was placed over the remaining contaminated soil, hot spot and non-spot but above acceptable risk levels. Contaminated soils from the bank and contaminated sediment from the Whitaker Slough at concentrations above the risk-based concentrations were placed on the property under the cap. The property is surrounded by a security fence on the west, east and south sides. The interceptor trench remains on the property to intercept any subsurface contamination that might migrate towards the slough. Contamination does not appear to be migrating toward the slough.

NARR Comments: (9/20/2005 DAB/SRS) In November 1989, DEQ retained Parametrix, a state contractor, to prepare a work plan for a Remedial Investigation and Feasibility Study (RI/FS) and a site security plan. A focused Remedial Investigation and Removal Assessment was completed in June 1993. DEQ retained another state contractor, Ecology & Environment (E&E) to address the principal threats at the site. An above ground storage tank was removed and a temporary cover was installed over the lagoon area in February 1994. A groundwater interceptor trench and oil recovery system were installed in August 1994 and extended to the full length of the site in May 1995. Ecology & Environment (E&E) completed its Removal Assessment report in March 1995, and completed a study of the sediment contamination in the Slough in September 1995. A contract for the removal of contaminated lagoon soils and sludges was awarded to Smith Environmental Technologies. Work began in late July 1996 and was completed in November 1996. Afterward, E&E conducted quarterly groundwater monitoring, and collected soil samples from areas of the site not included in the lagoon removal. A baseline risk assessment addressing both human health and ecological risk (Level II) was completed in September 1998. A draft FS report was received in October 1999. The draft report revealed data gaps

ODEQ STATE SUPERFUND SITE NU WAY OIL CO (Continued) **1000435885**

concerning the slough bank, sediment, and the groundwater/surface water interface. These data gaps were investigated in May 2000 and incorporated into a revised draft FS in September 2000. A focused Feasibility Study (limited to upland soils) was completed in February 2001. In 2001 and 2002, additional site investigations were completed to address the extent of petroleum hydrocarbons and chlorinated volatiles in the upland subsurface soils and groundwater, and to address the extent of sediment contamination in the Whitaker Slough. The Revised Baseline Risk Assessment was completed in January 2004. The draft Feasibility Study was completed in September 2004. This FS covers the entire project whereas the earlier FS was focused on uplands soils only. The staff report for the project was issued for public comment on September 15, 2005. (11/25/05 DAB) Record of Decision was signed on January 17, 2006. (3/09) Most of the remedial action has been completed. Most of the upland soil hot spots have been removed, the Whitaker Slough sediments have been dredged, and a two foot soil cap with engineered surface water drainage has been placed on the property. Operation and maintenance has involved watering and cap monitoring. The construction completion report was issued in January 2008. A site evaluation/protectiveness report was completed in spring 2009. Institutional controls are in place through DEQ monthly monitoring. (1/11 DAB) Sampling for the air pathway has been completed. Reporting will be completed during a five year review. (1/12 DAB) The Whitaker Slough is now being managed under the Columbia Slough Sediment Project ECSI #1283. (4/1/14) Reporting has been completed for the property. The property is monitored by DEQ bimonthly. DEQ is interested in finding a buyer for the property. (5/7/2015) An appraisal was generated for the property. Closure activities are underway and property sale may occur in 2015. (10/20/15) Wells were decommissioned in August 2015. In addition, the property was surveyed and remediation equipment removed. Property is ready for sale. (1/19/16) On October 1, 2015 Multnomah County foreclosed on the property. The property will go up for public sale in the near future. (1/3/2017) The property is up for public sale a second time. (10/5/17) Institutional Controls (Notice of Environmental Contamination) were recorded with Multnomah County on 8/28/17 for tax lots 1N2E Section 18bb, 1800 and 1N2E Section 18ba 3500. The associated CMMPs are located on Webdocs. (3/27/18) A Prospective Purchaser Agreement(PPA) for the Nuway Oil property was signed 1/27/18. Under the PPA the purchaser has recorded the institutional control (EES) with Multnomah County to implement and comply with institutional controls to maintain environmental site safety, contributed $80,000 to the Columbia Slough sediment cleanup (ECSI#1283) and place this long-vacant property into productive commercial use, consistent with City of Portland zoning. An institutional control (EES) was recorded with Mulnomah County for 7030 NE 46th Ave. to maintain the cap and comply with a CMMP. The associated documents are located on Webdocs. (5/8/18) In May 2018, DEQ issued a Certificate of Completion for the PPA and remedial action to address environmental contamination at the NuWay Oil site is complete, and no further action is required except for the following conditions: 1) comply with the easement and equitable servitudes to address groundwater use and health and safety considerations for subsurface excavation; 2) maintain the soil and gravel cap; 3) perform annual inspections of the cap and bank and complete reporting to DEQ every five years ; 4) implement the Contaminated Media Management Plan when managing soil or groundwater

ODEQ STATE SUPERFUND SITE NU WAY OIL CO (Continued) **1000435885**

generated at the site; and, 5) avoid activities that may compromise the reconstructed Whitaker Slough bank.

Decode for NarcdID: Health Threats
NARR Comments: Cleanup has been completed at the site. Contaminated soil remains on the property under a soil cap to control direct exposure to the contaminants. Only excavation on the property would result in direct exposure to remaining site contaminants and that is currently controlled by DEQ's soil cap monitoring program. DEQ is also monitoring activities on adjacent properties with some subsurface contamination from the Nuway site. The cleanup in Whitaker Slough was not complete due to feasbility issues. Whitaker Slough sediments are now managed under the Columbia Slough project. The site is fenced to restrict access, but access to the slough is unrestricted. There are no domestic wells at or very near the site. Groundwater is believed to discharge directly to the slough.

NARR Comments: The re-refining process, which occurred from 1935-1987, involved the removal of water, debris, and particles from the oil. The waste from this process including acid sludge, wastewater, and spent clay filtrate were disposed of in the unlined lagoon located in the west portion of the site. According to the site owner, waste was directed into the lagoon across the ground surface via trenches and berms instead of pipes and oil waste inundated site soil. When the facility was shut down in 1987, the lagoon was covered with spent clay, site

ODEQ STATE SUPERFUND SITE NU WAY OIL CO (Continued) **1000435885**

soil, and demolition debris.

Updated Date: 07/13/2018
Decode for NarcdID: Current Site Summary Statement
NARR Comments: (May 2018) The Nuway Oil Company operated a used oil re-refining facility at the site from 1935 to 1987. The investigation and cleanup of the property was performed by ODEQ as the former property owner was determined not to have sufficient financial resources to perform the complicated and substantial investigation and cleanup. The Record of Decision was issued in January 2006. The cleanup at the site included soil excavation, sediment dredging, bank stabilization, and site capping. Long term maintenance of the property is required due to contamination remaining under the cap. Multnomah County foreclosed on the property in 2015 due to back taxes.

A Prospective Purchaser Agreement (PPA) for the Nuway Oil property was signed on 1/29/2018. Under the PPA the purchaser recorded the institutional control (EES) with Multnomah County to implement and comply with institutional controls to maintain environmental site safety, contributed $80,000 to the Columbia Slough sediment cleanup (ECSI#1283) and place this long-vacant property into productive commercial use. Contamination is present in subsurface soils on off-site property east, west, and south of the Nuway property. Institutional Controls have been placed on the property and adjacent properties indicating that excavation in the subsurface may result in removal of contaminated soil that must be managed properly.

In May 2018, DEQ issued a Certificate of Completion for the PPA and remedial action to address environmental contamination at the NuWay Oil site is complete, and no further action is required except for the following conditions: 1) comply with the easement and equitable servitudes to address groundwater use and health and safety considerations for subsurface excavation; 2) maintain the soil and gravel cap; 3) perform annual inspections of the cap and bank and complete reporting to DEQ every five years; 4) implement the Contaminated Media Management Plan when managing soil or groundwater generated at the site; and, 5) avoid activities that may compromise the reconstructed Whitaker Slough bank.

Comments:	Contamination is present in subsurface soils on off-site property east, west, and south of the Nuway property. The adjacent property owners have been notified that excavation in the subsurface may result in removal of contaminated soil that must be managed properly. The Contaminated Media Management Plans are avaliable on webdocs. A Notice of Environmental Contamination was recorded in August 2017 with Multnomah County Clerk for two properties: 7039 S NE 46th Ave. Portland Oregon and 7107 NE 47th Ave. Portland Oregon.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

ODEQ STATE SUPERFUND SITE NU WAY OIL CO (Continued) **1000435885**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Decode for NarcdID: Remedial Action
NARR Comments: [11/30/11 SAM/ICP] Mutlnomah County Drainage District(MCDD) collected and tested sediments in McBride Slough as a part of sediment removal for floodwater conveyance. Sediment has elevated levels of PCBs, PAHs, and pesticides in both dredge material and proposed new leave surfaces. [1/4/12 SAM/ICP] DEQ approved emergency action work plan Dec 22, 2011. MCDD stockpiled dredged sediments within the channel for floodwater conveyance. Removal of sediment from channel is expected to take place in future. [8/3/12 SAM/VCP] Port of Portland signed a consent order in July 2012 to complete a Remedial Investigation, Risk Assessment, Source Control and a Feasiblity Study for McBride Slough. [4/25/13 SAM/VCP] DEQ approved project Work Plan on January 14, 2013. [4/30/14 SAM/VCP] The Port of Portland submitted a RI/RA/Source Control report in January 2014. In order to keep the project moving forward DEQ recommended revising the remedial investigation/ risk assessment and continue to work on the feasibility study for contaminated sediment concurrently with the stormwater source control evaluation. [4/28/15 SAM/VCP] The Port of Portland submitted the Feasibility Study on February 23, 2015. The proposed alternative includes flood control maintenance dredging of approximately 2-5 feet, afterwards an activated carbon amendment will treat residual sediment contamination. Bank repair will occur as needed. [7/21/15 VCP/SAM] Record of Decision completed July 18, 2015. The selected remedial action includes: flood control maintenance dredging of approximately 2-5 feet and removal of previously stockpiled material, afterwards an activated carbon amendment will treat residual sediment contamination. Bank repair will occur as needed. Long term monitoring and institutional controls will be developed. Changes were made to the remedial action proposed in the Staff Report based on public comments to expand measures to ensure protection of sensitive species that may be present at the site. The basic elements of the selected remedy however are the same as those presented in the staff report. [12/19/2016 VCP/SAM] RD/RA consent judgment negotiations complete for sediment cleanup; Multnomah county court entered a Judgment on 12/14/2016. The Port continues to investigate upland stormwater sources with data collection. [1/26/2018 VCP/SAM] DEQ approved the Remedial Action Final Design in September 2017. Implementation is expected to occur summer 2018. [6/4/2018 VCP/SAM} Remedial Action will occur between June and October 2018. [10/25/18 VCP/SAM] Due to production delays, sediments west of NE Alderwood will be dredged/capped in 2018 and east of NE Aldewood Rd will be dredged/capped in 2019.

NARR Comments: [June 2018] Remedial action will occur between June-October 2018. Remedial actions include: flood control maintenance dredging of approximately 2-5 feet of sediment and removal of previously stockpiled material, afterwards an activated carbon amendment will treat residual sediment contamination. Bank repair will occur as needed. Background: During historic Portland International Airport operations, hazardous substance releases, including PCBs, PAHs and metals likely occurred to McBride Slough as a result of contaminated storm water runoff. In 2011, DEQ approved emergency action dredging of contaminated sediments for floodwater conveyance. Sediments were stockpiled onsite. In 2012, Port of Portland signed a consent order to complete cleanup of McBride Slough sediments.

NARR Comments: [10/14/13 SAM/ICP] Based on the Phase I report and DEQ site visit, contaminants of interest include polychlorinated biphenyls (PCBs), metals, volatile organic compounds (VOCs), total petroleum hydrocarbons (TPH), polyaromatic hydrocarbons (PAHs) and asbestos. Complete exposure pathways considered relevant to this site are: Surface soil dermal contact and inhalation of indoor vapors for

KUHNAU PROPERTY (Continued) **S111766400**

future occupational workers. Subsurface soil dermal contact and inhalation of outdoor vapors for construction and excavation workers. Future use of the site is expected to remain general industrial.

NARR Comments: [5/8/12 SAM/ICP] Residual releases from Nuway Oil (ECSI#88) may extend to the NW corner of the property. Additional characterization is needed to determine extent. Fill soils should be characterized. [12/6/12 SAM/ICP] Draft Site Investigation Plan submitted Sept 2012. DEQ commented October 2012 and waiting revisions. [10/14/13 SAM/ICP] July 2013 Site Assessment Report Envirosearch summarized the environmental actions performed to further characterize the property. Three asbestos samples were collected in the northeast corner where suspected asbestos containing material was found in 2008. Surface soil was characterized using a multi-incremental sampling approach. Contaminants of interest (COI), based on contaminants detected at Nu-way Oil and the February 2008 Phase I Site Assessment, detected in surface soils were analyzed in four borings advanced to characterize subsurface fill and depth of native soils. Two groundwater samples were collected and analyzed for COIs from GP 1 and GP 2. An NFA determination is recommended for the Kuhnau Property site based on the following: Surface soils sampled onsite are protective for occupational and excavation workers. Subsurface soils are below occupational and excavation risk-based concentrations at thirteen of fourteen locations. Heterogeneous fill, including asphalt, may be responsible for the isolated higher concentration. Groundwater is not used onsite for any purpose and the area is supplied by a public water system. PAHs, VOCs and metals were detected, however, below applicable RBCs. Groundwater meets applicable risk-based concentrations, except for potential discharge to surface water. Considering the low magnitude and small area of the screening level exceedance, relatively large distance to the Slough and limited mobility of the contaminant in question (metals), exceedance of these criteria represents a low probability of risk. Surface soils meet ecological risk-based concentrations, except lead for bird populations, which is 1.5 times higher. Considering the site is zoned for industrial use and given the current habitat quality, exceedance of these criteria represents a low probability of risk. Migration of surface soil contaminants through stormwater runoff is unlikely because stormwater is expected to infiltrate onsite.

NARR Comments: Metal sludges from NaOH bath were deposited on ground surface to dry out; until 1990 chromic and HCL acid wastes went to an on-site holding tank and four deep dry wells. (4/30/97 LSK/SAS) Site re-evaluated as part of review of all sites within the Columbia Slough Study Area. The site is located near Buffalo Slough and Whitaker Slough, both of which have been evaluated as part of the city's Screening Level Risk Assessment (SLRA) of the Columbia Slough. Whitaker Slough has been identified as one of the five areas containing the most contaminated sediments, with lead and chromium of the highest concern. The east end of Buffalo Slough (portion closest to the site) is contaminated with chromium. Chromic acid has been

AB FINISHING TECH (Continued) **S111245465**

used historically on the site and has been found in groundwater beneath the site. An on-site storm drain system discharges to the Slough. (4/12/00 BAG/SRP) Follow-up investigations revealed that storm drains discharge to an on-site drywell, not to the Columbia Slough.

NARR Comments: EPA determined amount of waste was small; depth to groundwater about 40'-50' with discharge to the Columbia River; wells are located within one mile of the site; located in industrial area. E&E (EPA contractor) conducted site inspection in 1988 and sampled drinking water well used by AB Finishing. Sample results are: 149 ug/L and 265 ug/L hexavalent chromium. EPA Drinking Water Primary Standard is 50

AB FINISHING TECH (Continued) **S111245465**

ug/L. EPA evaluated this as a <quot>low priority<quot> site under the Federal Superfund program.

NARR Comments: An EPA PA was performed prior to the state PA. A 1988 sample from an on-site well contained hexavalent chromium at up to five times EPA's Primary Drinking Water standard. The use of chromium and disposal into drywells ceased in 1990, but large quantities of chromium probably entered groundwater. 1993 sampling of the on-site well suggests that chromium levels in groundwater beneath the site have decreased significantly since 1988. There are no immediate exposure pathways within at least a 1-mile radius of the site, and bottled water is used at the facility. Nevertheless, the possibility that large quantities of chromium have been disposed of at AB calls for additional action. Under medium priority, a groundwater investigation is recommended, to determine the extent and magnitude of dissolved chromium originating from AB's historical waste disposal methods. The facility should be added to the Confirmed Release List. (4/12/00 BAG/SRP) A site investigation was conducted in September-October 1999. Chromium was not detected in water samples from supply well. Soil samples were collected across site and analyzed for metals. No significant contamination was found, except for one location with elevated arsenic. This sample was collected from fill material obtained from Portland DOT, which was generated during Columbia Blvd. road reconstruction. A removal action will be performed in spring 2000. (2/12/01 BAG/SRP) Removal action completed in August 2000. Removal action report issued in October 2000. DEQ issued public notice on proposed No Further Action (NFA) on November 11, 2000, and issued an NFA letter December 1, 2000.

NARR Comments: In February 1993, in response to a complaint from an adjacent property owner, DEQ RCRA inspected this site, finding that it appeared to have been abandoned. RCRA staff observed numerous 55- and 5-gal. containers, and a variety of other containers stored throughout the property, mostly on a paved area in front of the site building. Many containers were corroded, stained, and in poor condition, and a few showed visible evidence of leakage. The property belongs to Rosalyn Seastrom, whose late husband had used the site to store surplus materials such as chemicals from the US Dept of Defense (DOD). Some of the DOD materials appeared to have expiration dates from the 1960s and 1970s. After the RCRA inspection, DEQ informed Mrs. Seastrom that the containers represented a potential threat to the environment and to public safety, and that assessment and stabilization of the site was required.

NARR Comments: In November 1993, DEQ directed Riedel Environmental Services to conduct an emergency removal of all materials of concern, using state funds. Riedel's work at the site consisted of securing the property; sampling containers for hazard categorization and grouping/bulking similar materials; arranging for off-site disposal of these materials; collecting near-surface soil samples at DEQ's direction; and evaluating the potential hazards of chemicals stored within the building. Riedel removed about 220 containers in which the following general compounds had been stored: acetone and alcohol; acid resins and emulsions; floor waxes; greases used to inhibit corrosion; paints and paint removers; petroleum-based oils, greases, solvents, and thinners; and sodium hydroxide-based soaps (solid and liquid). Following the removal, DEQ directed Riedel in the collection of six surface soil samples to determine if leaking drums or unknown past practices had caused contamination. Samples showed elevated levels of heavy hydrocarbons and slightly elevated levels of cadmium, chromium, and lead in one area. Some chemicals remain inside the building. DEQ plans no further removals or stabilization, and Site Assessment considers the site a low priority.

Decode for NarcdID: Site History
NARR Comments: Site at which the late Mr. Seastrom stored surplus chemicals purchased from DOD (about 100 drums), hoping to sell them. He left mess to his 78-year old widow. Rai Peterson had been working with her since 2/93; 11/3/93 F. Hansen decided to conduct an emergency HSRAF removal and petition DOD for cost recovery; Mary Wahl wanted PA done concurrently with removal, to assess need for future cleanup. Visit site 12/2/93 w/Rai; haz-catting and removal in progress (Riedel project manager is Chris Davies 286-4656). Most of site paved, so even with releases from corroded drums, subsurf. soil and GW contam. may be unlikely. 12/14 prepare sampling plan per Ed Wilson. 12/20 & 12/21 visit site to prepare for and oversee Riedel soil sampling; 6 samples collected 12/21, with analyses done per contract. Results 2/2/94: high O&G in spots, some elevated metals, especially lead, chromium, and cadmium in localized areas, no PAHs (but v. high detec. limit), insignif. VOCs. 6/16/94 complete SAPS, str. recom.: low prior. for further sampling/limited soil removal. 6/24 mtg. at HQ to discuss cost recovery, site assessment; it looks like DEQ has

SEASTROM PROPERTY (Continued) **S109608244**

completed its work at site. 6/27 revise str. recom. slightly after RP review, submit to Rosen; also fill out site rpt. 8/29/94 receive Rosen approval; finalize str. recom. and send copy to Heather; complete site rpt., send to Angela. Also send options ltr. to Mrs. Seastrom, copy R. Peterson and DOD contact. Place site on CRL HOLD, in view of fact that DOD may decide to conduct further work at site.

NARR Comments: (12/10/90 MM) A complainant alleged that Pierce Pacific dumped paints, thinners, and other solvents on the grounds and adjacent railroad tracks. A subsequent inspection of the facility found that all spent solvents and oils were collected in drums and picked up by a recycler. Inspection of the yard showed some significant staining. The main area affected is the south side of the yard adjacent to the railroad tracks. There is also staining down the railroad bank and in the area where drums of waste oil and solvent are stored.

NARR Comments: (12/10/90 MM) The site is bounded by railroad tracks to the south, beyond which is a densely populated residential neighborhood. To the north is an industrial area. Topography is flat with coarse sands to silts, probably with an upper clay horizon. NWR estimates a main soil area of 20 X 10 yards is affected, in addition to smaller stained areas. Groundwater is 90 feet below the site surface. There are two wells within a quarter mile (completed in 1940 and 1941); their uses are unknown.

NARR Comments: (4/12/94 GMW/SAS) A conversation with the property owner in 3/94 revealed that in 1991, Pierce Pacific vacated the site, which is now leased. Hydraulic oil from heavy equipment may have stained the soil that was noted during a DEQ complaint inspection in 1990. This oil entered a drain or dry well of unknown construction. The owner intends to clean up the site independently. If this does not occur, Site Assessment recommends a preliminary assessment. This warrants low priority consideration, due to the relatively low toxicity of hydraulic oils and the depth to groundwater in this area. (11/10/97 LSK) Site re-evaluated as part of review of all sites within the Columbia Slough Study Area. Located 0.5 miles south of the Buffalo Slough.

NARR Comments: 1/20/2016 (PRS) In the 1994 strategy recommendation, DEQ documented a 1990 site inspection performed as follow up to a complaint. The

PIERCE PACIFIC MANUFACTURING (Continued) **S111252673**

inspection documented soil staining on the south side of the property, which was deemed to most likely be attributable to hydraulic oil. A phase I site assessment was completed in October 2015. No recognized environmental conditions (RECs) were noted for the site property. A site investigation was performed in September 2015, documenting the following work: 1) Geophysical survey to identify any unknown sub surface features ; 2) Identification of, and sampling at three dry wells; 3) Cleaning of an onsite septic tank, and sampling from a boring within the drain field. 4) Completion of and sampling two borings, one at each end of a former excavation pit believed to be from a previously removed underground storage tank; 5) Collection of two near surface composite soil samples from the southern area where staining was observed during the 1990 inspection. TPH in the heavy oil-range, consistent with hydraulic oil, was detected in the two composite samples of surface soil at 287 and 488 milligrams per kilogram (mg/kg), respectively. TPH was not detected in any other samples. Detected TPH concentrations are below DEQ generic risk-based concentrations (RBCs) for occupational workers. One of these samples was subsequently analyzed for volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs) and polychlorinated biphenyls (PCBs). VOCs and PCBs were not detected and PAHs were detected below DEQs risk based concentrations applicable for occupational workers. Based on presence of residual contaminants below DEQs acceptable risk levels, a no further action determination has been issued for the site.

Decode for NarcdID: Contamination
NARR Comments: (6/26/96 GMW) In 1974, a DEQ WQ inspector discovered oil contamination along a drainage ditch running into Columbia Slough, which had resulted from Halton's uncontrolled pressure-washing of heavy equipment. Beginning in 1975, Halton's wastewater discharges occurred under an NPDES permit, limiting oil & grease and sediment effluent into the Slough. Twenty years later, the company is still having problems meeting discharge limits specified in its NPDES permit. The company removed 14 USTs [fuel, oil, waste oil] between 1991 and 1994, with some of the petroleum-contaminated soils excavated from tank pits being bioremediated and landfilled on-site, according to a Solid Waste Letter of Authorization Permit. Sediment collected from the wastewater-treatment system is also managed in this manner, under the NPDES permit. A 1990 inspection found that Halton had been discharging waste antifreeze into floor drains that led to exterior dry wells; although the company stopped this practice after the inspection, metals and other contaminants may have migrated into the subsurface via the dry wells. (6/10/98 SMF) DEQ SAS followed up two complaints alleging petroleum and asbestos contaminated soils stockpiled on-site (April 1998). Halton Company indicated that stained soils from area of former machine shop were combined with soils designated for use as on-site construction backfill material. On May 13-14, 1998, toxicologists for DEQ and E&E observed extensive sheen and petroleum sludge on Whitaker Slough originating from Halton Company storm drains. DEQ follow-up inspection on May 18 indicated sheens at facility's upstream and downstream stormwater outfalls, uncovered stockpile of contaminated soil on northern half of site, and petroleum sheens on puddled rainwater on site. Whitaker Slough sediment data from 1994 indicates elevated concentrations of molybdenum, 1,4-dichlorobenzene, PCE, chlorobenzene, diethyl phthalate, and Aroclor (PCB) 1254 at Halton site - contaminants that are apparently distinct from those detected at the adjacent upstream Nu-Way Oil site. (04.23.14 EKM) The Halton Company entered the DEQ voluntary cleanup program in June 2011 and a Consent Judgment with DEQ in 2012 to resolve in-water contamination related to the Columbia Slough. Halton Co. intends to investigate environmental contamination

HALTON COMPANY THE (Continued) **1000417393**

at their Main Campus and East Campus properties, and conduct a source control evaluation. DEQ approved a stormwater source control evaluation work plan for the Halton Properties in April 2013. Conducting stormwater sampling initiated spring 2013. DEQ approved a Remedial Investigation Work Plan in April 2014.

NARR Comments: Contaminated soils from LUST cleanups were self-remediated on a concrete pad on the northern half of the site, then landfilled on-site. Contaminated sludges from the site's oil/water separators have also been stored on this pad before being sent to the Marion County soil burner. Stained soils that were evidently encountered at a former on-site machine shop were combined with soils stockpiled for use as construction backfill material.

Updated By: Not reported
Updated Date: 12/17/2002
Decode for NarcdID: General Site Description
NARR Comments: An industrial facility on a 25.6-acre site along Whitaker Slough. The southern half of the site is paved and has 7 to 9 operating buildings. Two additional buildings are evidently being planned. The northern half of the site is unpaved sand/gravel, and has been used for open storage of equipment. Rainfall runoff from the southern half of the site is directed to Whitaker Slough. There are no obvious runoff controls on the northern half of the site. Much of the rainfall probably percolates to shallow groundwater on the northern half of the site.

NARR Comments: Site is currently zoned for industrial use, and may remain so for forseeable future. Properties north of NE Lombard/Portland Hwy (400 feet to the south of the site) are predominantly industrial, while those to the south are mainly residential. There appear to be five residential properties within 100 meters of the site: one along NE 42nd, and four along NE Buffalo St., just across Whitaker Slough.

Decode for NarcdID: Manner of Release
NARR Comments: Oil-contaminated wastewater discharged to drainage ditches leading to Slough; disposal of waste antifreeze to dry wells; possible disposal of other contaminants to these dry wells. Contaminated soils stockpiled on-site have not been covered, and runoff has not been contained. Stormwater is discharged to Whitaker Slough (under NPDES Permit). Floor drains in several operating buildings are tied to the stormwater drainage system. Stained soils that the Halton Company observed at old machine shop may be associated with past operations. Site historically collected wastewaters in an on-site lagoon.

Decode for NarcdID: Pathways & Other Hazards
NARR Comments: The site has had historical impacts on the Columbia Slough, and may continue to threaten the Slough's water quality. This is the principal pathway of concern at the site. Several very shallow domestic wells are located 0.7 to 0.8 miles to the west. It is unclear if any subsurface contamination at the site could reach these wells. Site groundwater should be very shallow - 7 to 12 feet bgs.

Updated Date: 04/23/2014
Decode for NarcdID: Remedial Action
NARR Comments: (7/5/96 GMW) DEQ's Water Quality Division is continuing to oversee Halton's compliance with its NPDES permit, which specifies limits on oil & grease, TSS, and pH of wastewater entering the Slough. This permit also covers the on-site remediation and disposal of sediment removed from the wastewater treatment system. The UST Section has issued a no further action letter (2/96) for issues related to the removal of 14 USTs, including a small pocket-in-place under the shop building. A January 1994 hazardous waste inspection found the facility to be generally in compliance with RCRA. Therefore, there appear to be three issues needing further evaluation: 1) residual contaminants in the drainage ditches, around the contaminated soil stockpile area, and in stormwater drains; 2) petroleum/PAH and solvents contamination in Slough sediments; and 3) metals and other contaminants in on-site dry wells. Previously, Site Assessment recommended investigation of these areas, under a low-to-medium priority. (10/16/96 LSK) Based on current Columbia Slough considerations, Site Assessment recommends a medium priority for further investigation; sampling recommended above should be conducted to confirm release and any historical deposition or current threat to Slough; coordinate further with WQ. (6/10/98 SMF) Based on petroleum releases to Slough observed May 13, 14, and 18, 1998, and observed lack of containment for runoff from on-site contaminated soils stockpile, the site is now considered a high priority for an XPA, and is proposed for addition to CRL. (04.23.14 EKM) The Halton Company entered the DEQ voluntary cleanup program in June 2011 and a Consent Judgment with DEQ in 2012 to resolve in-water contamination related

HALTON COMPANY THE (Continued) **1000417393**

to the Columbia Slough. Halton Co. intends to investigate environmental contamination at their Main Campus and East Campus properties, and conduct a source control evaluation. DEQ approved a stormwater source control evaluation work plan for the Halton Properties in April 2013. Conducting stormwater sampling initiated spring 2013. DEQ approved a Remedial Investigation Work Plan in April 2014.

NARR Comments: [June 2017] DEQ has determined no No Further Action is required for Halton Co. site (ECSI #121) and Halton Voith site (ECSI #1503) subject to certain conditions. The Halton Co. completed a remedial investigation and source control evaluation, under a Voluntary Cleanup Agreement with DEQ. In 2012, the Halton Co. also entered into a settlement with DEQ to resolve liability for contribution to contamination of Whitaker Slough and Ponds from the properties. The source control evaluation performed included stormwater monitoring

HALTON COMPANY THE (Continued) **1000417393**

and site improvements to remove and control contaminant sources. The evaluation and actions, in addition to payment into DEQ s settlement account, fulfill requirements of the 2012 settlement.

 At the Halton Company site, potential risks associated with hazardous substances (contaminants) in soil and groundwater above risk-based levels will be managed through institutional controls. Institutional controls include preserving surface covers, implementing a contaminated media management plan during subsurface work, ongoing stormwater controls, and restrictions on groundwater use. The DEQ Staff Memorandum in support of a Conditional No Further Action determination presents the basis in greater detail for DEQ s recommended CNFA and can be downloaded from this website (see below), in addition to other site documents.

Last Updated Date: 06/15/2017
Site Comment: DEQ s conditional NFA requires institutional controls to ensure continued protection of occupational workers and ongoing stormwater management controls. Required institutional controls include: a) implementation of the Contaminated Materials Management Plan; b) maintenance of caps and covers; c) restriction on groundwater use; and d) long-term stormwater management for continued source control. These control requirements have been incorporated into an Easement and Equitable Servitude (EES) for the Halton Co. site and recorded with the property deed. See also ECSI #1503.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D006
. Waste name: CADMIUM

. Waste code: D008
. Waste name: LEAD

. Waste code: D018
. Waste name: BENZENE

. Waste code: D027
. Waste name: 1,4-DICHLOROBENZENE

. Waste code: D039
. Waste name: TETRACHLOROETHYLENE

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF

HALTON COMPANY THE (Continued) **1000417393**

ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

NARR Comments: (1/15/2001 TJS/SW) The Killingsworth Fast Disposal Landfill (KFD) occupies the site of the former Nash Pit gravel quarry in northeast Portland. KFD was owned and operated by Riedel Waste Disposal Systems. The landfill was franchised by Metro and permitted by DEQ as a Demolition Waste Disposal Site in the early 1980s. Although permitted as a Demolition Waste Disposal Site, Metro, with DEQ permission, diverted non-putrescible domestic solid waste from the St. Johns Landfill (ECSI #164) to KFD in the late 1980s, when St. Johns was approaching capacity. The KFD Landfill closed in 1990. It is lined along the bottom and sides, and is equipped with a leachate collection system. The final landfill cover (constructed of a geomembrane, compacted soil, and grass) was completed in 1991. A limited gas-control system, consisting of 35 methane gas extraction wells, was completed in September 1992. Riedel Waste Disposal Systems was subsequently dissolved, and its parent company declared bankruptcy in 1994. DEQ received $545,000 as part of the bankruptcy settlement in December 1995. It was not known if the soils imported to the site for use as a landfill cap were tested prior to being placed at the site. In addition, the methane collection system was installed to inhibit the ability of methane vapors to migrate off-site, however the effectiveness of the system was not assessed for a park user scenario. Therefore, the city of Portland requested brownfield assistance from DEQ to conduct additional sampling of the property to identify potential environmental concerns associated with the unknown contaminant content of the landfil soil cap, the effectiveness of the methane collection system, and the general outdoor air quality of the area.

NARR Comments: In 2011-2012, DEQ's Cleanup Program used funds from the 128(a) EPA Brownfield grant to perform site sampling activities at the site. In coordination with the Cully neighborhood community, the City of Portland s Parks and Recreation Bureau developed a master plan to redevelop the landfill into Thomas Cully Park. Due to previous site

KILLINGSWORTH FAST DISPOSAL LANDFILL (KFD) (Continued) **S115330254**

use, there were questions regarding the potential presence of contaminants in the landfill cap (surface soils) and outdoor air. Therefore, DEQ and the Oregon Health Authority (OHA) worked in collaboration with the Community Involvement Committee to develop a sampling plan with the objective of completing a Health Consultation to determine human health risk exposure to future park users and workers. The site sampling activity included the collection of outdoor air and soil samples. The site is a 24-acre closed landfill located in northeast Portland between NE 72nd and NE 77th Avenues and Columbia Boulevard. Previous use of the property included agricultural activity and a gravel quarry operation. In the early 1980 s Riedel Waste System (RWS) began operation of the Killingsworth Fast Disposal (KFD) landfill by accepting demolition waste under a DEQ permit. The landfill was permanently closed in 1990. Following closure, the owner installed a landfill gas collection system. Shortly thereafter, RWS informed DEQ that it was financially unable to perform post-closure maintenance and monitoring activities. RWS later abandoned the site and was eventually administratively dissolved by the Secretary of State for failure to pay annual license fees. By the mid-1990's, the landfill gas collection system had become unsafe and unreliable. High methane levels were reported throughout the landfill, threatening neighboring residences and businesses. Several subterranean fires occurred in the landfill, further damaging the existing gas collection system and the geomembrane cap. In 1995, DEQ began performing maintenance and monitoring to prevent further degradation of the property and to protect human health and the environment. By 1998, DEQ had determined that a new landfill gas collection system was necessary to prevent migration and possible explosion of methane in surrounding areas. In early 1999, DEQ determined that conditions at the property presented a substantial and imminent threat to human health. DEQ began performing actions at the property to mitigate threats to human health posed by methane that included: installation of new landfill gas extraction wells, piping, blowers and flare tower; grading and drainage improvements; and extensive repair of the geomembrane cap. These activities were completed in the fall of 2000, at a total cost of approximately $1,500,000. DEQ funded the activities primarily from the Solid Waste Orphan Site Account established under Oregon Revised Statutes (ORS) 465.381. DEQ did not accept ownership of the property. In 2000, Multnomah County took possession of the property through tax foreclosure. In 2002, DEQ and the City of Portland entered into an intergovernmental agreement that shifted operation and maintenance of the closed landfill from DEQ to the city. The ownership of the property was also transferred at no cost from Multnomah County to the city of Portland s Bureau of Parks and Recreation. Since that time, the city of Portland and Metro have entered into a separate agreement where Metro manages the site for the city of Portland. In 2010, sediment from the Laurelhurst pond dredging action was placed at the KFD landfill for capping material. Prior to removing the sediment from the pond, analysis of RCRA 8 metals, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), E.coli, and total organic carbon was conducted. Sediment that was considered clean fill was transported to the KFD landfill. Sediment with PCB detections were capped in place at Laurelhurst Park. The primary environmental exposure concerns for potential future park users are contact with site surface soil and exposure to landfill gas. It was

KILLINGSWORTH FAST DISPOSAL LANDFILL (KFD) (Continued) **S115330254**

not known if the soil imported to the site for use as a landfill cap, prior to the placement of the Laurelhurst pond dredge material, was tested prior to being placed at the site. In addition, the methane collection system was installed to inhibit the ability of methane vapors to migrate off-site, however the effectiveness of the system was not assessed for a park user exposure scenario. (7/29/2012 RWA) Sampling of surface soils and ambient air was conducted in April 2012. Soil samples were analyzed for asbestos, PCBS, herbicides, organochlorine pesticides, RCRA 8 metals, PAHs, dioxin, and TPH. All soil samples were below urban residential exposure RBCs for all contaminants of interest, indicating that the site was protective for future park workers and users. Ambient air data showed consistent levels of ethylbenzene and naphthalene with the Portland metro area. (5/16/14 RWA) As part of park development activities at the site, approximately 45,000 yd3 of soil is planned for excavation from a property at South Waterfront (Block 43) and relocation and spreading at Cully Park. DEQ and the Oregon Health Authority have reviewed data reports associated with soil and groundwater sampling at Block 43 and have determined that soil from Block 43 is safe for relocation and reuse at Cully Park, provided that appropriate screening protocols be followed that are associated with the November, 2013 Contaminated Media Management Plan, Field Procedures Memo, and March 2014 DEQ letters (these documents are included as Web Docs). Additional soil from the Woodstock/Eastmoreland sewer rehabilitation project is being imported to Cully Park for use as cover. Laboratory analysis of soil borings collected from the sewer rehabilitation project area showed that the soil is suitable for import to Cully Park (soil meets applicable screenign levels considered safe for use at the Park). DEQ issued a No Further Action letter in December, 2015. Park completion is scheduled for 2017. Soil (stockpiles 'B' and 'C') from the Multnomah County Drainage District stockpiles at Portland International Airport will be imported to Cully Park to meet final grading requirements. Lab analysis and DEQ and Oregon Health Authority evaluation determined the soil to be protective of park users. DEQ and OHA met with members of the Community Involvement Committee to discuss the site-specific park user risk-based concentration that was developed for evaluation of the soil in November, 2016.

NARR Comments: (1/15/2001 TJS/SW) DEQ used the bankruptcy settlement funds to conduct post-closure activities at the landfill. However, due to underground fires and other problems, by 1998 most of the methane gas extraction wells were no longer functioning, and only passively vented methane gas. A new gas control system was necessary, as were repairs to the landfill cap and drainage system, but there were not enough funds in the settlement account to pay for this work. To address the problem, in June 1999 the Environmental Quality Commission adopted a temporary rule designating methane gas from abandoned landfills, under specified conditions, as a hazardous waste. DEQ designated KFD as an Orphan project in July 1999, and used funds from the Solid Waste Orphan Site Account to design and install a new methane gas control system, and implement upgrades to the landfill cover, site drainage, and site security. DEQ completed the design of the new landfill gas (LFG) system in August 1999. DEQ installed 38 new LFG extraction wells in September 1999. The rest of the upgrades were completed in early 2000. The site has been referred back to the Solid Waste program for long-term monitoring. In 2010, sediment from the Laurelhurst pond dredging action was placed at the KFD landfill for capping material. Prior to removing the sediment from the pond, analysis of RCRA 8 metals, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), E.coli, and total organic carbon was conducted. Sediment that was considered clean fill was transported to the KFD landfill. Sediment with PCB detections were capped in place at Laurelhurst Park. The primary environmental exposure concerns for potential future park users are contact with site surface soil and exposure to landfill gas. It is not known if the soil imported to the site for use as a landfill cap, prior to the placement of the Laurelhurst pond dredge material, was tested prior to being placed at the site. In addition, the methane collection system was installed to inhibit the ability of methane vapors to migrate off-site, however the effectiveness of the system

KILLINGSWORTH FAST DISPOSAL LANDFILL (KFD) (Continued) **S115330254**

was not assessed for a park user exposure scenario. (12/23/2011 RWA/CU) As part of a proposed redevelopment of the KFD landfill into Cully Park, the City of Portland and Verde requested DEQ brownfield assistance to determine if unacceptable risks were associated with the change of use for the site. The Oregon Health Authority is also providing technical assistance through community outreach, education, and the development of a health consultation following sampling. (7/29/2012 RWA) Sampling of surface soils and ambient air was conducted in April 2012. Soil samples were analyzed for asbestos, PCBS, herbicides, organochlorine pesticides, RCRA 8 metals, PAHs, dioxin, and TPH. All soil samples were below urban residential exposure RBCs for all contaminants of interest. Ambient air data showed consistent levels of ethylbenzene and naphthalene with the Portland metro area. (5/14/2014 RWA) As part of park redevelopment activities, approximately 45,000 yd3 of soil will be imported to Cully Park. One of the source properties for the imported soil is located in South Waterfront (Block 43). DEQ and Oregon Health Authority have reviewed site data associated with soil and groundwater sampling at Block 43 and have determined that the soil planned for excavation at Block 43 is protective of future park users and workers, provided appropriate protocols are followed (that are presented in the Contaminated Media Management Plan for Block 43, dated November, 2013 and the DEQ protocol lettters, dated March, 2014). (RWA 8/2014) Additional soil from the Woodstock/Eastmoreland sewer rehabilitation project is being imported to Cully Park for use as cover. Laboratory analysis of soil borings collected from the sewer rehabilitation project area showed that the soil is suitable for import to Cully Park (soil meets applicable screenign levels considered safe for use at the Park). The DEQ approval letter is included in WebDocs. Soil import to Cully Park is scheduled for the spring-fall of 2014, with park completion scheduled for Fall, 2015.

NARR Comments: Methane gas is the major potential site hazard. On-site monitoring is conducted monthly. If elevated levels of gas are detected, monitoring is increased to as often as daily, and several off-site houses and mobile homes are also monitored. So far, no off-site monitoring points have shown dangerous levels of methane. Operation of the new gas extraction wells should help to control methane levels and prevent fire hazards. The soil used for the landfill cap is of unknown origin and chemicals of potential concern were: TPH, metals,

KILLINGSWORTH FAST DISPOSAL LANDFILL (KFD) (Continued) **S115330254**

PCBs, PAHs, herbicides, pesticides, and dioxins. Subsequent sampling of surface soils and ambient air, with analyses for asbestos, PCBs, herbicides, organochlorine pesticides, RCRA 8 metals, PAHs, dioxins, and TPH showed no contaminants in soil or air that exceeded appropriate risk levels.

Updated Date: 07/18/2012
Decode for NarcdID: Site History
NARR Comments: (12/23/11/RWA/CU) Previous use of the property included agricultural activity and a gravel quarry operation. In the early 1980 s Riedel Waste System (RWS) began operation of the Killingsworth Fast Disposal (KFD) landfill by accepting demolition waste under a DEQ permit. The landfill was permanently closed in 1990. Following closure, the owner installed a landfill gas collection system. Shortly thereafter, RWS informed DEQ that it was financially unable to perform post-closure maintenance and monitoring activities. RWS later abandoned the site and was eventually administratively dissolved by the Secretary of State for failure to pay annual license fees. By the mid-1990's, the landfill gas collection system had become unsafe and unreliable. High methane levels were reported throughout the landfill, threatening neighboring residences and businesses. Several subterranean fires occurred in the landfill, further damaging the existing gas collection system and the geomembrane cap. In 1995, DEQ began performing maintenance and monitoring to prevent further degradation of the property and to protect human health and the environment. By 1998, DEQ had determined that a new landfill gas collection system was necessary to prevent migration and possible explosion of methane in surrounding areas. In early 1999, DEQ determined that conditions at the property presented a substantial and imminent threat to human health. DEQ began performing actions at the property to mitigate threats to human health posed by methane that included: installation of new landfill gas extraction wells, piping, blowers and flare tower; grading and drainage improvements; and extensive repair of the geomembrane cap. These activities were completed in the fall of 2000, at a total cost of approximately $1,500,000. DEQ funded the activities primarily from the Solid Waste Orphan Site Account established under Oregon Revised Statutes (ORS) 465.381. DEQ did not accept ownership of the property. In 2000, Multnomah County took possession of the property through tax foreclosure. In 2002, DEQ and the City of Portland entered into an intergovernmental agreement that shifted operation and maintenance of the closed landfill from DEQ to

KILLINGSWORTH FAST DISPOSAL LANDFILL (KFD) (Continued) **S115330254**

the city. The ownership of the property was also transferred at no cost from Multnomah County to the city of Portland s Bureau of Parks and Recreation. Since that time, the city of Portland and Metro have entered into a separate agreement where Metro manages the site for the city of Portland. In 2010, sediment from the Laurelhurst pond dredging action was placed at the KFD landfill for capping material. Prior to removing the sediment from the pond, analysis of RCRA 8 metals, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), E.coli, and total organic carbon was conducted. Sediment that was considered clean fill was transported to the KFD landfill. Sediment with PCB detections were capped in place at Laurelhurst Park. NARR Comments: [May 2017] Sampling of surface soil and ambient air was conducted in April 2012. Soil samples were analyzed for asbestos, PCBs, herbicides, organochlorine pesticides, RCRA 8 metals, PAHs, dioxins, and TPH. All soil samples were below urban residential exposure risk-based concentrations for contaminants of interest. Ambient air data showed levels of ethylbenzene and naphthalene consistent with levels in the Portland metro area. Approximately 80,000 yd3 of soil was imported to the park in 2014/2015 from Block 43 in South Waterfront and the Woodstock/Eastmoreland sewer rehabilitation project in SE Portland. Prior to importing the soil to Cully Park, the soil was tested for contaminants, with no contaminants found above health-based screening levels. Approximately 25,000 yd3 of soil is planned for import to the park from the Port of Portland International Center property in NE Portland. The stockpile soil was evaluated using a site-specific park user health-based screening level for benzo(a)pyrene and is considered protective for future park workers and users. DEQ approved importing the soil in May 2017. DEQ continues to work in collaboration with Verde and the City of Portland to ensure that site conditions remain protective of future park workers and users throughout the development process.

NARR Comments: (8/18/05 DM/SAP) Contamination from waste oil from a waste oil tank. Drip pans were inverted to drain directly to the ground. Oil contaminated soil must be removed. (7/27/11 JKS) Confirmation sampling performed following the March 2009 removal of approximately 4.2 tons of petroleum-impacted soil revealed diesel-range hydrocarbons at concentrations as high as 9,730 mg/kg in the west excavation sidewall at a depth of 3 feet bgs. Between April 2009 and July 2010, test pit investigations to delineate the extent of contamination were conducted at the site. Diesel-range hydrocarbons were not detected in delineation soil samples at concentrations exceeding 1,000 mg/kg. Gasoline and heavy oil hydrocarbons were detected at maximum concentrations of 42 mg/kg and 539 mg/kg, respectively. Petroleum hydrocarbon contamination was found to be restricted to the vicinty of the AST containment and vehicle fueling

NARR Comments: (8/18/05 DM/SAP) Site was referred to the site assessment program through the stormwater facility inspector. (7/27/11 JS/TANKS) In March 2009, petroleum impacted soil was removed from the vicinity of utility lines running beneath the sidewalk of the vehicle fueling area on the south side of the AST containment. Diesel product spilled on the sidewalk had entered the subsurface through a hole in the sidwalk installed for future utility installation. The excavation was taken to a depth of 3-4 feet bgs. Approximately 4.2 tons of impacted soil was removed from the vicinity of the utility trench.

NARR Comments: [6/21/10 SAM/SA] The site is comprised of 4 adjoining tax lots next to the head of Buffalo Slough, an arm of the Columbia Slough. Land use is fairly evenly mixed of industrial, residential and open spaces within 0.5 miles of the site. The immediate surrounding area along Columbia Blvd. and NE 42nd Ave is industrial, with the exception of Broadmoor Golf Course about 500ft to the west. Two residential properties share the sites western property line.

Decode for NarcdID: Pathways & Other Hazards
NARR Comments: [6/22/10 SAM/SA] Contaminated underground soils and groundwater could pose a threat to future utility trench workers. Stormwater: Site stormwater is removed via city stormpipe system to Whitaker Slough(outfall 73A). A 1996 Buffalo Slough Remedial Investigation/Feasibility Study report notes that one private 2 inch stormwater outfall is located on the Jersey property and discharges into Buffalo Slough. However, a review of City of Portland records with City of Portland stormwater personnel did not show this outfall. During a site visit on 5/ 19/10, the site s stormwater drainage system appeared to be in dis-repair and in need of maintenance.

Decode for NarcdID: Site History
NARR Comments: [6.21.10 SAM/SA] Site specific history is limited. The USGS aerial map from 1952, suggests the site near Buffalo Slough was probably used as residential and/or farming. The next chronologically Web-available USGS aerial map in 1973 suggests the site has been developed for industrial purposes. This is consistent with the general Portland city planning that areas near the Columbia Slough were developed for industrial purposes in the 1960s. The former tenant John L. Jersey and Son, Inc. is an excavation contractor for construction, grading and demolition. The Jersey sur-name has been associated with the site since the early 1970s. John L. Jersey and Son, Inc. left the site in Spring 2009. Activities on site included truck storage, truck maintenance, parts cleaning with solvents and a wash pad is present on site. All activities, except for truck storage, were conducted on asphalt and/or concrete per the site s 2008 Stormwater Management Plan. Two new tenants are on site with similar activites as the previous actvities.

NARR Comments: [9/5/12 ICP/SAM]The Dale Jersey Property was first brought to the attention of the DEQ Cleanup Program in 2004 and at that time it was attached to the John L Jersey/Coe Property as ECSI#4161. The site was identified in the Columbia Slough Area-wide Site Discovery project, specifically to determine the source of high concentrations of chromium in the Buffalo Slough. DEQ prepared a Strategy Recommendation for the #4161 property in 2010. No comments about the Dale Jersey Property (tax lot 100) were noted in the Strategy Recommendation. In February 1993, a 2,500-gallon diesel underground storage tank(UST) located to the NE of the house, was decommissioned by removal (DEQ UST ID #4542). The tank was removed without giving DEQ 30- day or 3-day notices; however confirmation sampling and administrative paperwork was received by DEQ in March 1993. Diesel and gasoline (by TPH-HCID) were not detected in two confirmation soil samples. In April 2012 a limited Phase II Environmental Site Assessment was performed by Kleinfelder. A magnetometer survey did not find any subsurface USTs or metallic debris on site. Twenty (20) soil and three (3) groundwater samples from nine push probe points on roughly 75 foot centers, were collected and analyzed. An NFA determination is recommended for the Dale Jersey Property site based

DALE JERSEY PROPERTY (Continued) **S112058713**

on the following: In 1993, the UST was removed and confirmation sample results were non-detect for diesel and gasoline. 2012 groundwater sample results were below residential risk based values for petroleum, PAHs and VOCs. 2012 soil results were non-detect for petroleum. The site has not been a significant source of contaminants of concern to the Columbia Slough. Under the current residential/industrial use zoning this site does not pose a significant threat to human or ecological receptors.

NARR Comments: (9/22/2015 KRT) A jet A fuel release occured at the Bulk Fuel Storage Facility prior to 1989 which promped Reidel Environmental to install six soil borings/monitoring wells around the periphery of the Bulk Fuel Storage Facility. No release date or fuel release quantity are know. No remedial actions were taken. This release was associated with the Chevron Pipe Line serving the Bulk Fuel Storage Facility. (3/12/96 GMW/SAS) In January 1992, drain valves were left open at the base of two 840,000-gallon above-ground fuel tanks at the site, resulting in the release of about 2,000 gallons of jet fuel. The release caused significant contamination of soils within the containment area. Some jet fuel flowed beyond the containment area as well. In the immediate aftermath of the release, approximately 1,250 gallons of fuel were recovered, and 600 yards of contaminated soil were excavated and removed. However, not all contaminated soil could be excavated, due to concerns about undermining tank foundations.

AIRCRAFT SERVICE INT'L GROUP (Continued) **S103842746**

(9/22/2015 KRT) During the August 1995 removal of a 10,000-gallon underground tank storing off-spec jet fuel mixtures, extensive soil and groundwater contamination was found around the UST. Some contaminated soil was left in place during the removal. Prior to 2002, subsurface investigations at Bulk Fuel Storage Facility indicated soil and groundwater contamination from known and unknown past releases. Up to 31,000 ppm of hydrocarbons remain in soil; shallow groundwater contained total BTEX in the 100 ppb to 3,000 ppb range. (10/25/02 cwh/sas) The site risk was rescored in 2002 based upon submission of groundwater data and a request from BBA Aircraft Shared Services for a no further action determination. In return in 2002, DEQ sent a letter to ASIG requesting Expanded Preliminary Assessment of Bulk Fuel Storage Facility at the Portland International Airport. This request was partially completed in 2012 with soil investigation at the former UST and sampling of groundwater from nine site monitoring wells.

NARR Comments: (3/12/96 GMW/SAS) Partial source soil removals occurred after the January 1992 jet fuel release and the August 1995 UST decommissioning. A contractor estimated in 1992 that approximately 4,500 yards of contaminated soil remained in and around the above-ground tanks. The site has nine perimeter monitoring wells that have been sampled on an irregular basis for TPH/BTEX. The DEQ Leaking Underground Storage Tank Program used log #26-89-0012 to transfer project responsibility to DEQ Cleanup Division for the site as release sources include a UST, ASTs, and a pipeline. DEQ Site Assessment has concluded from its evaluation of the tank farm facility that the owner or operator should characterize soil contamination and evaluate remedial options to prevent further groundwater degradation. Groundwater monitoring should also continue. These further actions should be addressed under VCP guidance. The site is a medium priority, and has been added to the Confirmed Release List.

NARR Comments: 1989 During site constructino activities petroleum hydrocarbons were discovered in an excavation for a canopy footing. Monitoring wells indicate that the contaminatino originated from above ground storage tanks (ASTs), associated piping or past work practices. Release details are unknown. Fuel discovered in soil and groundwater at bulk plant prompted investigation. Summer 1989 - Six monitoring wells installed peripheral to 2-acre bulk plant site to evaluate previous fuel release(s). 1/29/1992 - approx 2000 gallons released from AST valves onto soil inside AST secondary containment area. Soil cleanup and subsurface investgaton followed. pre-1992 - Three additional monitoring wells installed north and northwest of bulk plant faicility to investigate possible pipeline/UST releases. 1995 - One 10,000-gal UST slop tank decommissioned and removed. Partial soil cleanup performed. Additonal monitoring performed. 2012 - Continued subsurface investigatoni peripheral to 10,000 UST excavation, well monitoring, wellhead survey. 2015 - DEQ requests additinoal site characterizatkon to determine nature and extent of affected groundwater downgradient of bulk plant.

NARR Comments: At least three releases of jet fuel have occurred at this bulk fuel tank farm from before 1989 to 1995. Contaminated soil was excavatedfrom two areas as removal actions. Improving groundwater quality with time indicates that soil removal action and natural attenution has been effective at reducing contamination sources to groundwater. DEQ has requested additional site information to fill data gaps need to evaluate the site for regulatory closure

NARR Comments: (7/11/05 TER/VCP) In September 1996, the Port of Portland joined the Voluntary Cleanup Program to obtain oversight of investigation and cleanup associated with the Terminal Expansion South (TES) construction project at Portland International Airport. Jet fuel contamination associated with fuel hydrants and fuel spills has been detected in the TES construction area. Former runways and taxiways

ALASKA AIRLINES (Continued) **U001150065**

also have petroleum contamination, which is likely related to past surface oiling or dust suppression. Petroleum products contain potential carcinogens and other toxic substances including polynuclear aromatic hydrocarbons (PAHs). The primary exposure route of concern is direct contact for workers considering both current construction work and future site activities. PAH-contaminated soil from beneath a former taxiway was excavated as part of TES I construction. A DEQ Record of Decision (ROD) was completed in July 1998 for the management of that soil in a berm on airport property, northwest of the active runways. A ROD to address residual jet fuel contamination at TES Phase I, near Concourse C, was signed by DEQ in December 1999. The TES I ROD requires maintenance of the existing asphaltic concrete surface to prevent exposure to underlying petroleum-contaminated soils. In 2001, the Port finalized a Remedial Investigation and Risk Assessment (RI/RA) report for TES Phase II/III, related to the completion of Concourse C improvements. The Port completed a Feasibility Study for TES Phase II/III soil in 2002, and DEQ finalized the Phase II/III ROD in June 2002. Similar to TES Phase I, the Phase II/III ROD requires maintenance of the airfield tarmac and adjacent buildings as a cap to prevent exposure to site workers. Groundwater investigation at the TES sites was initially limited to one-time push probe sampling. Six groundwater monitoring wells were installed on the south side of Concourse C at the site in May 2001. Additional wells were installed in 2003 as part of TES Phase III construction to better define the extent of groundwater contamination. In August 2004, the Port submitted a beneficial water use determination (BWUD) for the airport vicinity. The Port has completed one year of groundwater monitoring for all site wells to define the nature and extent of groundwater contamination. DEQ is reviewing an evaluation risk from groundwater contamination at TES, which indicates that contamination in groundwater is below concentrations of concern. DEQ will issue a no further action determination for groundwater. The Port updated its Airport Layout Plan in February 2006 as part of the institutional control for the soil remedy.

Updated By: Not reported
Updated Date: 12/17/2002
Decode for NarcdID: Contamination
NARR Comments: A system of storm drains has been constructed beneath Portland International Airport (PDX) to remove stormwater. The drains discharge to vegetated canals that lead to the Columbia Slough. On the western part of the site, surface impoundments with skimmers are used to remove contaminants before the water reaches the slough; surface water from the eastern part of the site reaches the slough without treatment. The drainage canals receive contaminants when fuel spills on the tarmac are washed into the storm drains. Seven fuel spills of more than 40 gallons each are known to have occurred on the tarmac from 1983 to 1991; other earlier fuel spills are likely. In June 1987, the East and North drainage canals were sampled and found to contain high levels of lead and petroleum. With DEQ's approval, PDX decided to excavate 230 feet of the East canal and the entire North canal. All visibly contaminated sediments and soils (approximately 539 cubic yards worth) were excavated and disposed of off-site. It is not known whether confirmation samples were taken. Additionally, at least 32 surface and underground storage tanks containing petroleum products are known to have been installed at PDX. Six of the underground tanks have been removed, and no contamination above DEQ standards was left at any of the removal sites.

Decode for NarcdID: Pathways & Other Hazards
NARR Comments: The site is located between the Columbia River and the Columbia Slough. Prior to the airport's construction, the site was a mixture of farmlands and wetlands. Three areas of wetlands still surround the site, and the drainage ditches have been classified as wetlands. The site is technically located in the Columbia River floodplain; however a series of dikes along the Columbia shore protect the site from all but the largest (1,000 year) floods. The top two to five feet of soils at the site are generally sand and silt loams. Directly beneath these soils lie sand and gravel aquifers, which are connected to the South Shore wellfield aquifers upgradient of the site. Although the aquifers are connected, the Columbia Slough should act as a barrier to any contaminant migration.

Decode for NarcdID: Remedial Action
NARR Comments: PTI Environmental Services completed a Preliminary Assessment (PA) on the site for DEQ in April 1991. After reviewing background information on the site, PTI recommended an expanded Preliminary Assessment (XPA) <quot>to ascertain the nature and extent of contamination at suspected release sites where sampling has not been conducted.<quot> DEQ agrees with PTI's recommendation. (See also ECSI #704 and #1065 for more information about potential contamination at the site).

Incident Id: 990365
Incident Narrative: HM 41 WAS CALLED TO PDX TO POSSIBLY IDENTIFY AN ODOR FROM AN AIRPLANE CARGO HOLD/ POSSIBLE RADIOACTIVE MATERIALS INVOLVED. AN ENTRY TEAM MONITORED THE ATMOSPHERE AND SEVERAL SUSPECTED PACKAGES AND FOUND NEGATIVE RESULTS. THE PACKAGES WERE INTACT AND THERE WAS NO RELEASE OF ANY HAZARDOUS MATERIALS.
Incident Date: 12/3/1999

Responsble Party: GARY BANKSTON
RP Company: ALASKA AIRLINES
RP Address: PORTLAND INTL AIRPRT
RP City,St,Zip: PORTLAND 97218
Facility ID: 870066
OERS Number: Not reported

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

NY MANIFEST: Facility and Manifest Data

Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.

Date of Government Version: 01/01/2019
Date Data Arrived at EDR: 01/30/2019

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

PANG BASE ENCLAVE
6801 NE CORNFOOT RD
PORTLAND, OR 97218

TARGET PROPERTY COORDINATES

Latitude (North):	45.57553 - 45° 34' 31.91''
Longitude (West):	122.59845 - 122° 35' 54.42''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	531330.8
UTM Y (Meters):	5046748.5
Elevation:	22 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	6067232 MOUNT TABOR, OR
Version Date:	2014

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

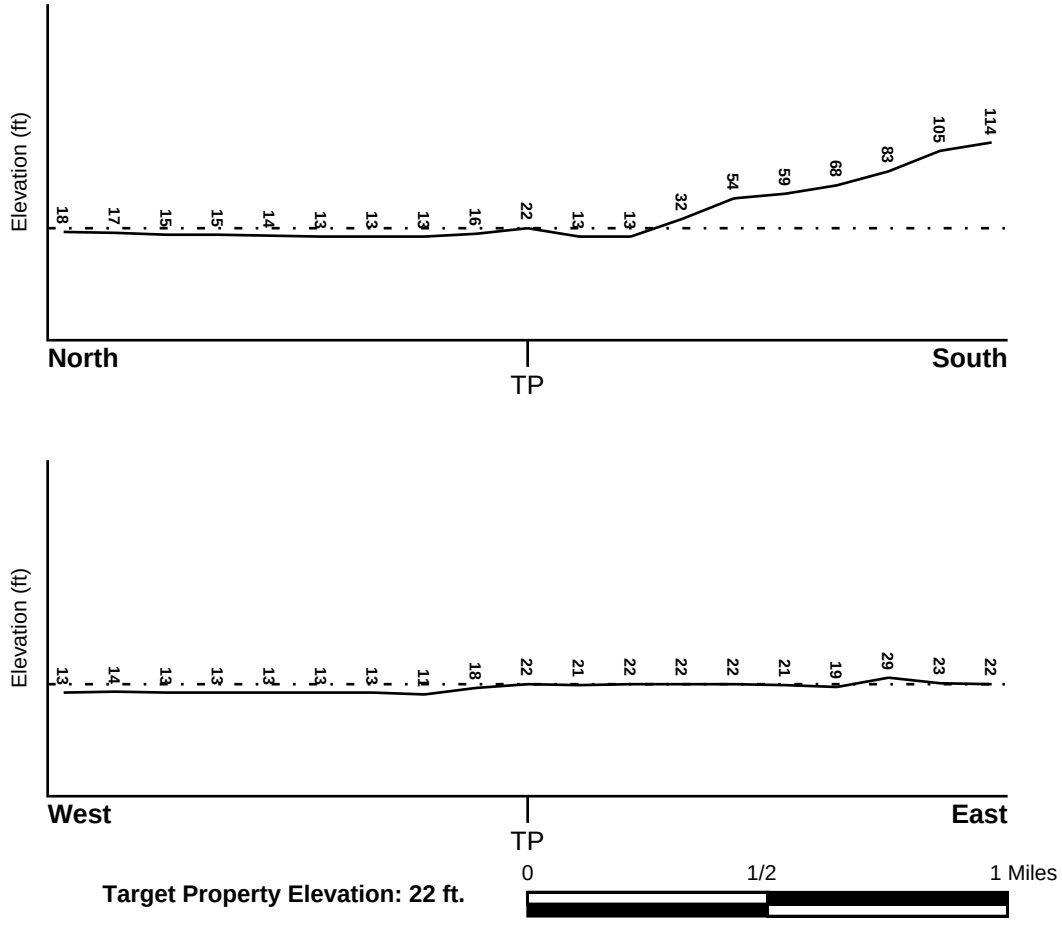
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General West

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 22 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
4101830105F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
41051C0180H	FEMA FIRM Flood data
4101790180B	FEMA Q3 Flood data
4101790190A	FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOUNT TABOR	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Sauvie

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 5 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 5.6
2	14 inches	38 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 5.6
3	38 inches	59 inches	very fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 5.6

Soil Map ID: 2

Soil Component Name: Water

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: Sauvie

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 5.6

3	38 inches	59 inches	very fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 5.6

Soil Map ID: 4

Soil Component Name: Pilchuck

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.3 Min: 6.1

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
2	11 inches	59 inches		Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.3 Min: 6.1

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Appendix B.1
Interview Records

PA Interview Questionnaire - Environmental Manager

Facility: PANG
Interviewer [redacted]
Date/Time: 9/18/18

Interviewee [redacted] **Title:** See below **Phone Number:** **Email:**	Can your name/role be used in the PA Report? (Y) or N Can you recommend anyone we can interview? (Y) or N [redacted]

1. Roles or activities with the Facility/years working at the Facility.

[redacted] - OMD Environmental Manager (~15 years)
[redacted] - OMD Cultural Resources Manager (~15 years)

2. Where can I find previous facility ownership information?

Will send

3. What can you tell us about the history of PFAS including aqueous film forming foam (AFFF) at the Facility? Was it used for any of the following activities, circle all that apply and indicate years of active use, if known? Identify these locations on a facility map.

Maintenance
Fire Training Areas
Firefighting (Active Fire)
Crash
Fire Suppression Systems (Hangers/Dining Facilities)
Fire Protection at Fueling Stations
Non-Technical/Recreational/ Pest Management
Metals Plating Facility
Waterproofing Uniforms (Laundry Facilities)
Other

None used past or present to knowkdge

4. Fill out CSM Information worksheet with the Environmental Manager. OK

5. Are any current buildings constructed with AFFF dispensing systems or fire suppression systems? What are the AFFF/suppression system test requirements? What is the frequency of testing the AFFF/suppression system? Do you have "As Built" drawings for the buildings?

No

PA Interview Questionnaire - Environmental Manager

Facility:_____
Interviewer:_____
Date/Time:_____

6. Are fire suppression systems currently charged with AFFF or have they been retrofitted for use of high expansion foam? If retrofitted, when was that done?

NO

7. How is AFFF procured? Do you have an inventory/procurement system that tracks use?

N/A

8. What type of AFFF has been/is being used (3%, 6%, Mil Spec Mil-F-24385, High Expansion)? Manufacturer (3M, Dupont, Ansul, National Foam, Angus, Chemguard, Buckeye, Fire Service Plus)?

N/A

9. Where is the AFFF stored? How is it stored (tanks, 55-gallon drums, 5-gallon buckets)? What size are the storage tanks? Is the AFFF stored as a mixed solution (3% or 6%) or concentrated material?

N/A

10. How many FTAs are/were on this facility and where are they? Locate on a map. How many FTAs are active and inactive? For inactive FTAs, when was the last time that fire training using AFFF was conducted at them?

None

Interviewer: _____
Date/Time: _____

11. When a release of AFFF occurs during a fire training exercise, now and in the past, how is the AFFF cleaned and disposed of? Were retention ponds built to store discharged AFFF? Was the AFFF trickled to the sanitary sewer or left in the pond to infiltrate?

N/A

12. Can you recall specific times when city, county, and/or state personnel came on-post for training? If so, please state which state/county agency or military entity? Do you have any records, including photographs to share with us?

NO

13. Did military routinely or occasionally fire train off-post? List the units that you can recall used/trained at various areas.

May train @ another ARNG facility; no specific knowledge of dates if training did occur

14. Did individual units come with their own safety personnel, did they also bring their own AFFF? Was training with AFFF part of these exercises? How were emergencies handled under these circumstances?

N/A

15. Are there specific emergency response incident reports (i.e., aircraft or vehicle crash sites and fires)? If so, may we please copy these reports? Who (entity) was the responder?

None for facility; possible @ adjacent airport

PA Interview Questionnaire - Environmental Manager

Facility: _____
Interviewer: _____
Date/Time: _____

16. Do you have records of fuel spill logs? Was it common practice to wash away fuel spills with AFFF? Is/was AFFF used as a precaution in response to fuel releases or emergency runway landings to prevent fires?

No; not common practice; facility may keep spill log records but no AFFF

17. Was AFFF used for forest fires or fire management on-post/off-post? If so, please describe what happened and who was involved?

No

18. Are there mutual aid/use agreements between county, city, and local fire department? Please list, even if informal. If formalized, may we have a copy of the agreement?

Informal; any structural fire would be responded to by City of Portland or Portland International Airport

19. Can you provide any other locations where AFFF has been stored, released, or used (i.e. hangars, buildings, fire stations, firefighting equipment testing and maintenance areas, emergency response sites, storm water/surface water, waste treatment plants, and AFFF ponds)?

N/A

20. Are you aware of any other creative uses of AFFF? If so, how was AFFF used? What entities were involved?

NO

PA Interview Questionnaire - Environmental Manager

Facility:_____
Interviewer:_____
Date/Time:_____

21. Are there past studies you are aware of with environmental information on plants/animals/ groundwater/soil types, etc., such as Integrated Cultural Resources Management Plans or Integrated Natural Resources Management Plans?

NO

22. What other records might be helpful to us (environmental compliance, investigation records, admin record) and where can we find them?

Associated environmental reports from ANG facility or Portland Airport (both adjacent)

23. Do you have or did you have a chrome plating shop on base? What were/are the years of operation of that chrome plating shop?

NO

24. Do you know whether the shop has/had a foam blanket mist suppression system or used a fume hood for emissions control? If foam blanket mist suppression was used, where was the foam stored, mixed, applied, etc.?

N/A

25. How is off-spec AFFF disposed (used for training, turned in, or given to a local Fire Station)? If applicable, do you know the name of the vendor that removes off-spec AFFF? Do you have copies of the manifest or B/L?

N/A

PA Interview Questionnaire - Environmental Manager

Facility:_____
Interviewer:_____
Date/Time:_____

26. Do you recommend anyone else we can interview? If so, do you have contact information for them?

Facilities manager [redacted]

PA Interview Questionnaire - Other

Facility: PANG
Interviewer [redacted]
Date/Time: 9.14.18

Interviewee: [redacted] **Title:** Facilities Maintenance Mgr. **Phone Number:** — **Email:** —	Can your name/role be used in the PA Report? Y or N Can you recommend anyone we can interview? Y or N

Roles or activities with the Facility/Years working at the Facility:

Facilities Manager since ~ 2015

Manage / take care of various small related tasks around facility; make sure buildings + utilities are working properly

PFAS Use: Identify accidental/intentional release locations, time frame of release, frequency of releases, storage container size (maintenance, fire training, firefighting, buildings with suppression systems (as builts), fueling stations, crash sites, pest management, recreational, dining facilities, metals plating, or waterproofing). How are materials ordered/purchased/disposed/shared with others?

* No knowledge of AFFF or any other PFAS-related use, storage or release
* One fire extinguisher in kitchen (class K)
* No trainings on site / no overhead helicopter trainings
* Facility Environmental Manager ([redacted]) also no knowledge of AFFF-related activity

Known Uses
Use
Procurement
Disposition
Storage (Mixed)
Storage (Solution)
Inventory, Off-Spec
Containment
SOP on Filling
Leaking Vehicles
Nozzle and Suppression System Testing
Dining Facilities
Vehicle Washing
Ramp Washing
Fuel Spill Washing and Fueling Stations
Chrome Plating or Waterproofing

PA Interview Questionnaire - Other

Facility: _____
Interviewer: _____
Date/Time: _____

* Facility is on City of Portland water
* Previously a FMS however no AFFF or fire trucks (~3-4 years ago)
* Troops generally train @ Adair or Rilea
* OWS last pumped out ~2015
* No GW monitoring wells
* No SW treatment

Appendix B.2
Visual Site Inspection Checklists

Visual Survey Inspection Log

Recorded by: [redacted]
ARNG Contact: [redacted]
Date: 9/14/18

Source/Release Information

Site Name / Area Name / Unique ID: PANG Base Enclave
Site / Area Acreage:
Historic Site Use (Brief Description): Informal trainings; previous Air base; armory for storage
Current Site Use (Brief Description): Armory/storage of equipment; used b/c of close proximity to airport

1. Was AFFF used (or spilled) at the site/area? Y / (N)

2. Has usage been documented? Y / (N)
   2a. If yes, keep a record (place electronic files on a disk):

3. What types of businesses are located near the site? (Industrial) / (Commercial) / Plating / Waterproofing / (Residential)
   3a. Indicate what businesses are located near the site: Airport; large businesses; residential area

4. Is this site located at an airport/flightline? Y / (N)
   4a. If yes, provide a description of the airport/flightline tenants: No but directly adjacent (Portland International Airport)

Other Significant Site Features:

1. Does the facility have a fire suppression system? Y / (N) (Not at this particular location on FTIG)
   1a. If yes, indicate which type of AFFF has been used:
   1b. If yes, describe maintenance schedule/leaks:
   1c. If yes, how often is the AFFF replaced:
   1d. If yes, does the facility have floor drains and where do they lead? Can we obtain an as built drawing?

Transport / Pathway Information

Migration Potential:

1. Does site/area drainage flow off installation? (Y) / N
   1a. If so, note observation and location: Generally to Columbia Slough ~0.5 miles south

2. Is there channelized flow within the site/area? (Y) / N
   2a. If so, please note observation and location: Ditches and stormwater lines

3. Are monitoring or drinking water wells located near the site? (Y) / N
   3a. If so, please note the location: well field located directly east of facility (owned + operated by City of Portland)

4. Are surface water intakes located near the site? Y / (N)
   4a. If so, please note the location:

Significant Topographical Features:

1. Has the infrastructure changed at the site/area? Y / (N)
   1a. If so, please describe change (ex. Structures no longer exist):

Visual Survey Inspection Log

2. Is the site/area vegetated? Y / (N)

2a. If not vegetated, briefly describe the site/area composition:

3. Does the site or area exhibit evidence of erosion? Y (N)

3a. If yes, describe the location and extent of the erosion:

4. Does the site/area exhibit any areas of ponding or standing water? Y (N)

4a. If yes, describe the location and extent of the ponding:

Receptor Information

1. Is access to the site restricted? (Y) / N

1a. If so, please note to what extent: Gated entrance

2. Who can access the site? **(Site Workers) / (Construction Workers) (Trespassers) / Residential / Recreational Users / Ecological**

2a. Circle all that apply, note any not covered above:

3. Are residential areas located near the site? (Y) / N

3a. If so, please note the location/distance: Surrounding the site

4. Are any schools/day care centers located near the site? (Y) / N

4a. If so, please note the location/distance/type: Community college ~2 miles south

5. Are any wetlands located near the site? Y (N)

5a. If so, please note the location/distance/type:

Additional Notes

Photographic Log

Photo ID/Name	Date & Location	Photograph Description

Appendix B.3
Conceptual Site Model Information

Preliminary Assessment – Conceptual Site Model Information

Site Name: PANG Base Enclave

Why has this location been identified as a site? Historic imagery indicated site may have been used as a vehicle maintenance shop and AFFF may have been stored or used at this site

Are there any other activities nearby that could also impact this location? Yes, potential activities from the nearby Portland International Airport or the adjacent ANG property may have impacted this facility

Training Events

Have any training events with AFFF occurred at this site? No

If so, how often? N/A

How much material was used? Is it documented? N/A

Identify Potential Pathways: Do we have enough information to fully understand over land surface water flow, groundwater flow, and geological formations on and around the facility? Any direct pathways to larger water bodies?

Surface Water:

Surface water flow direction? Varies depending on area of facility. Generally south towards the Columbia Slough, approximately 0.5 miles south

Average rainfall? 45.6 inches/year

Any flooding during rainy season? No

Direct or indirect pathway to ditches? Direct

Direct or indirect pathway to larger bodies of water? Indirect

Does surface water pond any place on site? No

Any impoundment areas or retention ponds? No

Any NPDES location points near the site? No

How does surface water drain on and around the flight line? N/A

Preliminary Assessment – Conceptual Site Model Information

Groundwater:

Groundwater flow direction? Considerable variation between water-bearing units and fluctuations seasonally; some flow directions noted as west and northwest, while other measurements suggest fluctuating flow from northeast and south

Depth to groundwater? Generally, 2-10 feet bgs

Uses (agricultural, drinking water, irrigation)? Industrial and drinking water

Any groundwater treatment systems? No

Any groundwater monitoring well locations near the site? Yes. Monitoring wells located within the site;

Is groundwater used for drinking water? No, however, a well field is located directly east of the facility and periodically has treated, clean groundwater injected into the aquifer for future withdrawal during high-demand months

Are there drinking water supply wells on installation? No

Do they serve off-post populations? N/A

Are there off-post drinking water wells downgradient? Yes, see above comment on nearby well field. At least one residential drinking water well located approx. 1.5 miles southeast of the facility

Waste Water Treatment Plant:

Has the installation ever had a WWTP, past or present? No

If so, do we understand the process and which water is/was treated at the plant? N/A

Do we understand the fate of sludge waste? N/A

Is surface water from potential contaminated sites treated? N/A

Equipment Rinse Water

1. Is firefighting equipment washed? Where does the rinse water go?

N/A

2. Are nozzles tested? How often are nozzles tested? Where are nozzles tested? Are nozzles cleaned after use? Where does the rinse water flow after cleaning nozzles?

N/A

3. Other?

Preliminary Assessment – Conceptual Site Model Information

Identify Potential Receptors:

Site Worker: No

Construction Worker: No

Recreational User: No

Residential: No

Child: No

Ecological: No

Note what is located near by the site (e.g. daycare, schools, hospitals, churches, agricultural, livestock)?

Industrial facilities (in all directions); adjacent airport (>0.2 miles north and east); nature park (1 mile southwest); church (2 miles south); golf course (1 mile southeast); college campus (1 mile southeast)

Documentation

Ask for Engineering drawings (if applicable). Okay

Has there been a reconstruction or changes to the drainage system? When did that occur? No

Appendix C
Photographic Log

APPENDIX C – Photographic Log

Army National Guard, Preliminary Assessment for PFAS	PANG Base Enclave	Portland, Oregon

Photograph No. 1

Description:

Facing southeast. A small storage building located to the left (Building 04004) with the main facility building located to the right. (Building 04001).

Photograph No. 2

Description:

Facing northwest. View of the oil water separator on site which was last emptied in 2015.

APPENDIX C – Photographic Log

Army National Guard, Preliminary Assessment for PFAS	PANG Base Enclave	Portland, Oregon

Photograph No. 3

Description:

Facing southeast. View of one of the ammunition and vehicle storage units located on the west side of the facility.

Photograph No. 4

Description:

Non-PFAS containing fire extinguishers stored in Building 04005. All fire extinguishers contain ABC foam or Purple K.

APPENDIX C – Photographic Log

Army National Guard, Preliminary Assessment for PFAS	PANG Base Enclave	Portland, Oregon

Photograph No. 5

Description:

The non-PFAS containing fire extinguisher located within the kitchen of Building 04001.
