Havre de Grace, MD 21078

ARNG-CSG-P March 30, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at General Jones Armory, Chicago, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 20, 2013 at the Illinois Army National Guard General Jones Armory, 5200 S. Cottage Grove, Chicago, Illinois. The site points of contact were Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The General Jones Armory was built in 1929. The facility has 270,690 square feet of floor space. The armory is the base of operations for HHC 178th and HHQ 122nd FA. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The General Jones Armory had an indoor firing range (IFR) that was closed and is no longer in use. Weapons may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. The weapons vaults were not accessible on the day of the survey.

The armory is available for rental for community activities that include being used as a location to shoot movies and an annual VA Stand Down. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for toxic metals. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Four of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in front of the weapons vault (room N119), had a lead concentration of 385 µg/ft^2. A sample collected at the firing line in the former IFR had a lead concentration of 923 µg/ft^2. A sample collected on the floor midrange in the former IFR had a lead concentration of 540 µg/ft^2. A

sample collected on the floor at the bullet trap in the former IFR had a lead concentration of 1,506 µg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces of the break room and maintenance areas using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the General Jones Armory. Forty of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

During the walk through, water damage, mold and peeling paint were observed in several areas. Water damaged ceiling tiles and mold growth were observed in the kitchen, Room W113, and the trophy case area at Room N216A . The locker room, S210 had extensive water damage, mold growth, and peeling paint on the ceiling.

Peeling paint, water damage and mold growth were also observed in the medical orderly room W101, the medical storage room W201, the scout platform room W104, the S3 office and storage area W105, the mortar's office and storage area W106, supply storage W107, library N202, HHB training room S222, weight room S202,cardio room S205, locker room S208, conference room S201, and the janitor's closet. Due to the age of the building, the peeling paint is likely to be lead containing. The following actions are required:

- **Repair roofs and walls to prevent additional water leakage (RAC 2).**

- **Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).**

- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

- **Perform a lead paint inspection. If peeling paint contains lead, a licensed lead abatement contractor should be engaged to perform lead abatement of the peeling paint (RAC 2).**

Appendix A
Toxic Metals – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of toxic metals into food handling spaces. The samples were analyzed for toxic metals by OSHA Method ID-121. The results and photos are contained in Table A-1.

The General Jones Armory had an indoor firing range (IFR) that was closed and is no longer in use. The weapons vaults were not accessible on the day of the survey.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Four of the surface wipe sample results exceeded the guideline for lead.

Sample ILGJW24, which was collected on the floor in front of the weapons vault (room N119) had a lead concentration of 385 $\mu g/ft^2$. Sample ILGJW26, which was collected on the floor at the firing line in the former IFR, had a lead concentration of 923 $\mu g/ft^2$. Sample ILGJW27, which was collected on the floor midrange in the former IFR, had a lead concentration of 540 $\mu g/ft^2$. Sample ILGJW28, which was collected on the floor at the bullet trap in the former IFR, had a lead concentration of 1,506 $\mu g/ft^2$.

Table A-1
Surface Area Wipe Sampling Results for Toxic Metals
Illinois Army National Guard
General Jones Armory
Chicago, Illinois
December 20, 2013

Sample #	Location	Photo	Lead (µg/ft^2)	Cadmium (µg/ft^2)	Chromium (µg/ft^2)
Surface Guideline			**200**	**28**	**6,970**
ILGJW21	Room W106, Mortar's Office and Storage, on Floor		166	11	<91
ILGJW22	Room W113, Kitchen, on Table		<91	<9.1	<91
ILGJW23	Drill Floor, Center, on Floor		<91	<9.1	<91
ILGJW24	In Front of Room N119, Vault, on Floor		**385**	<9.1	<91
ILGJW25	Basketball Court, Center, on Floor		<91	<9.1	<91
ILGJW26	Firing Line, Former IFR, on Floor		**923**	<9.1	<91

Sample #	Location	Photo	Lead (µg/ft^2)	Cadmium (µg/ft^2)	Chromium (µg/ft^2)
Surface Guideline			**200**	**28**	**6,970**
ILGJW27	Midrange, Former IFR, on Floor		**540**	<9.1	<91
ILGJW28	At Bullet Trap, Former IFR, on Floor		**1,506**	<9.1	148
ILGJW29	At Bullet Trap, Former IFR, on Bullet Trap		<91	<9.1	<91
ILGJW30	Field Blank	N/A	ND	ND	ND

Notes: 1) µg/ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. Clean the horizontal surfaces of the break room and maintenance areas using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

ANALYTICAL REPORT

Submitted To: USPHS / Federal Occupational Health
Denver Federal Center
Denver, CO 80225

Attention: Non-Responsive

Submitted By:

Reference Data: Lead, Cadmium and Chromium
Sampling Site: NGB: Chicago, IL (General Jones Armory)
Sample Media: Ghost Wipe(s)®
Method Reference: OSHA ID-121
Project ID: Project 11541
DFOH Lab Nos.: TM-14-65716 through TM-14-65725
Date Received: 12/27/13
Data Analyzed: 12/30/13 – 12/31/13
Date Issued: 01/02/14

The wipe samples were hot plate digested. The samples were run on a Perkin Elmer 200 flame atomic absorption spectrophotometer (AA).

General Lab Comments:
All quality control criteria have been met.
* All samples received in condition acceptable for analysis unless otherwise noted.
** Sample results have not been corrected for contamination based on the field blank or other analytical blank unless otherwise noted.

Analytical results are given on the enclosed tables. Results relate only to items tested. If you have any questions about these results, feel free to phone the Laboratory at (312) 886-0413.

Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Forty spaces in the facility did not meet the minimum lighting level.

Break Room, 4th Floor	6-53	30	Partially
Room S302, Latrine	12-26	30	No

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

Appendix C
Water Damage - Mold – Peeling Paint

During the walk through, water damage, mold and peeling paint were observed in several areas. Water damaged ceiling tiles and mold growth were observed in the kitchen, Room W113, (Figure C-1) and the trophy case area at Room N216A (Figure C-2). The locker room, S210 had extensive water damage, mold growth, and peeling paint on the ceiling (Figures C-3 to C-5).

Peeling paint, water damage and mold growth were also observed in the medical orderly room W101, the medical storage room W201, the scout platform room W104, the S3 office and storage area W105, the mortar's office and storage area W106, supply storage W107, library N202, HHB training room S222, weight room S202,cardio room S205, locker room S208, conference room S201, and the janitor's closet. Due to the age of the building, the peeling paint is likely to be lead containing.

Figure C-1 – Water Damage and Mold on Ceiling Tiles in Kitchen W113

Figure C-2 – Water Damage and Mold on Ceiling Tiles in Trophy Case Area at Room N216A

Figure C-3 – Peeling Paint and Mold in Locker Room S210

Figure C-4 – Peeling Paint in Locker Room S210

Figure C-5 – Mold in Locker Room S210

Recommendations:

1. Repair roofs and walls to prevent additional water leakage (RAC 2).

2. Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).

3. Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).

4. Perform a lead paint inspection. If peeling paint contains lead, a licensed lead abatement contractor should be engaged to perform lead abatement of the peeling paint (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P October 14, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Kedzie Armory, Chicago, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on August 7 & September 9, 2014 at the Illinois Army National Guard Kedzie Armory, 1551 North Kedzie Avenue, Chicago, Illinois. The site points of contact were Non-Responsive .

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Kedzie Armory was built in 1940. The facility has 204,256 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and five weapons vaults. The armory is the base of operations for the 244th Army Liaison Team, the HHC of the 108th Sustainment Brigade, and recruiters. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the days of the survey. The armory is available for rental for assemblies for homeless veterans. The veterans are provided with showers, haircuts, and medical exams.

Site personnel reported that the Kedzie Armory had an indoor firing range (IFR) that was closed between 12 and 14 years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. On August 7, the initial day of the survey, personnel at the site could not provide access to the closed firing range and four of the weapons vaults. A return visit was scheduled on September 9 to collect wipe samples for lead in the closed firing range and weapons vaults.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Nine of the surface wipe sample results exceeded the guideline for lead. Sample ILKEW11, which was collected on the floor in vault 1, had a lead concentration of 609 μg/ft^2. Sample ILKEW13, which was collected on the floor outside the entrance to vault 2, had a lead concentration of 347 μg/ft^2. Sample ILKEW22, which was collected on the floor in the northeast corner of the caged storage area, at the bullet trap in the former IFR, had a lead concentration of 5,620 μg/ft^2. Sample ILKEW23, which was collected on the floor in the southeast corner of the caged storage area, at the bullet trap in the former IFR, had a lead concentration of 4,645 μg/ft^2. Sample ILKEW24, which was collected on the floor in the caged storage area, at the center of the range along the wall in the former IFR, had a lead concentration of 9,238 μg/ft^2. Sample ILKEW25, which was collected on the floor in the caged storage area, at the firing line in the former IFR, had a lead concentration of 4,283 μg/ft^2. Sample ILKEW26, which was collected on the floor in the northeast corner of vault 2, had a lead concentration of 835 μg/ft^2. Sample ILKEW28, which was collected on a shelf in the northeast corner of vault 3/the radiac room, had a lead concentration of 244 μg/ft^2. Sample ILKEW29, which was collected on the floor in the northeast corner of vault 4, had a lead concentration of 2,788 μg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. (RAC 2)**

- **Materials stored in the closed indoor firing range should be cleaned and decontaminated before being used or distributed by site personnel (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Kedzie Armory. Twelve of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

During the walk through, water damage, mold growth and peeling paint were observed in several areas. Water damaged ceilings and walls, peeling paint and mold growth were observed in room 225, an office suite and room 227, an office suite. The following actions are required:

- **Repair roofs and walls to prevent additional water leakage (RAC 2).**

- **Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).**

- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

Site personnel reported that the Kedzie Armory had an indoor firing range (IFR) that was closed between 12 and 14 years ago. On August 7, the initial day of the survey, personnel at the site could not provide access to the closed firing range and four of the weapons vaults. A return visit was scheduled on September 9 to collect wipe samples for lead in the closed firing range and weapons vaults.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Nine of the surface wipe sample results exceeded the guideline for lead. Sample ILKEW11, which was collected on the floor in vault 1, had a lead concentration of 609 μg/ft^2. Sample ILKEW13, which was collected on the floor outside the entrance to vault 2, had a lead concentration of 347 μg/ft^2. Sample ILKEW22, which was collected on the floor in the northeast corner of the caged storage area, at the bullet trap in the former IFR, had a lead concentration of 5,620 μg/ft^2. Sample ILKEW23, which was collected on the floor in the southeast corner of the caged storage area, at the bullet trap in the former IFR, had a lead concentration of 4,645 μg/ft^2. Sample ILKEW24, which was collected on the floor in the caged storage area, at the center of the range along the wall in the former IFR, had a lead concentration of 9,238 μg/ft^2. Sample ILKEW25, which was collected on the floor in the caged storage area, at the firing line in the former IFR, had a lead concentration of 4,283 μg/ft^2. Sample ILKEW26, which was collected on the floor in the northeast corner of vault 2, had a lead concentration of 835 μg/ft^2. Sample ILKEW28, which was collected on a shelf in the northeast corner of vault 3/the radiac room, had a lead concentration of 244 μg/ft^2. Sample ILKEW29, which was collected on the floor in the northeast corner of vault 4, had a lead concentration of 2,788 μg/ft^2.

The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. Materials stored in the closed indoor firing range should be cleaned and decontaminated before being used or distributed by site personnel.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Kedzie Armory
Chicago, Illinois
August 7 and September 9, 2014

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILKEW11	Vault 1, on floor in corner, on floor		**609**
ILKEW12	Vault 1, on table		64
ILKEW13	Entrance to vault 2, on floor		**347**
ILKEW14	Room 225, Office, on desktop		<10
ILKEW15	Room 231, Computer lab, on desktop		<10
ILKEW16	Room 254, S4 office, on conference table		<10

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILKEW17	Teleconference room, on conference table		<10
ILKEW18	Room 317, Medic office, on desktop		<10
ILKEW19	Kitchen, on prep table		32
ILKEW20	Dining hall, in corner, on floor		<10
ILKEW21	Field blank	N/A	ND
ILKEW22	Caged storage, former IFR, at bullet trap, northeast corner, on floor		**5,620**
ILKEW23	Caged storage, former IFR, at bullet trap, southeast corner, on floor		**4,645**
ILKEW24	Caged storage, former IFR, center of range along wall, on floor		**9,238**

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILKEW25	Caged storage, former IFR, at firing line, by entrance		**4,283**
ILKEW26	Vault 2, northeast corner, on floor		**835**
ILKEW27	Outside vault 2, on the table where weapons are cleaned		88
ILKEW28	Vault 3, Radiac room/storage, on shelf in northeast corner		**244**
ILKEW29	Vault 4, northeast corner, on floor		**2,788**
ILKEW30	Vault 5, Radio storage, on northwest corner shelf		42
ILKEW31	Field blank	N/A	ND

Notes: 1) µg/ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. (RAC 2)

2. Materials stored in the closed indoor firing range should be cleaned and decontaminated before being used or distributed by site personnel (RAC 2).

3. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

4. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

5. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Twelve spaces in the facility did not meet the minimum lighting level.

Table B-1
Lighting Measurements
Illinois Army National Guard
Kedzie Armory
Chicago, Illinois
August 7 and September 9, 2014

Locations	Measured Illumination (foot candles)	Required Illumination (foot candles)	Standard Met?
Vault 1	78-94	30	Yes
Room 200A, Office, 108th Sustainment Brigade	89-92	50	Yes
Parking garage	11-64	30	Partially
Parking garage adjacent office	6-53	50	Partially
Room 225, Office	35-59	50	Partially
Room 225 suite, adjacent office	81-93	50	Yes
Room 227, open office	55-81	50	Yes
Room 231, Computer lab	32-91	50	Partially
Briefing/classroom area, former gym	40-59	50	Partially
Room 242, Men's latrine	30-55	30	Yes
Room 254, S4 office	38-100	50	Partially
Room 255, Office	51-74	50	Yes
Room 257, Office (light intentionally disabled)	12-30	50	Yes
Teleconference room	43-52	50	Partially
Room 317, Medic office	50-133	50	Yes
NCO room	26-44	50	No
Room 115, Recruiter office	46-82	50	Partially
Room 134, Locker room	46-71	30	Yes
Room 140, Fitness room	52-70	50	Yes
Kitchen	13-99	50	Partially
Kitchen storage	9-39	30	Partially
Dining hall	40-73	30	Yes
Drill floor	37-79	50	Partially

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

Appendix C
Water Damage and Mold

During the walk through, water damage, mold growth and peeling paint were observed in several areas.

Water damaged ceilings and walls, peeling paint and mold growth were observed in room 225, an office suite (Figure C-1). Water damaged ceilings and mold growth were also observed in room 227, an office suite (Figure C-2).

Figure C-1 – Water Damaged Ceiling and Walls, Peeling Paint and Mold Growth on Wall in room 225, office suite

Figure C-2 – Water Damage and Mold Growth on Ceiling in room 227, office suite

Recommendations:

1. Repair roofs and walls to prevent additional water leakage (RAC 2).

2. Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).

3. Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P October 14, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Crestwood Armory, Crestwood, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 18, 2013 at the Illinois Army National Guard Crestwood Armory, 13800 Crawford Avenue, Crestwood, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Crestwood Armory is the base of operations for 122nd Bravo 2nd Battalion FA; 1744th Transportation Company; 433rd Signal Company; Golf 734th Support; and 405th Support BSB. During the week, most of the activities at the armory involve administrative work. The Crestwood Armory had an indoor firing range that was closed in the early 1980s. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that no vehicle maintenance is performed at the armory since the Crestwood Armory shares the same building with FMS 2.

The armory is not available for rental for community activities. The drill floor is used for the site's family Christmas party. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

On the day of the armory survey, a concurrent industrial hygiene survey was being performed in FMS 2. During the survey in FMS 2 an engine fire occurred while a fuel injection pump was being replaced on a Humvee. Shop personnel reported that when a new fuel injection pump was installed and the engine was started, it began to race at full throttle. Attempts to stop the engine were unsuccessful and it ran until it overheated, began smoking, and caught fire. Shop personnel responded with portable fire extinguishers and extinguished the fire. Personnel from the armory smelled smoke and requested that air monitoring be performed in room 231 (an office) in the armory.

Air monitoring in room 231 was performed after the fire had been extinguished. The samples were analyzed for metals, organic vapors and total particulates. Air sampling results were compared to the applicable OSHA Permissible Exposure Limit (PEL) or the American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Value (TLV). Full-shift sampling results were compared to the 8-hour time-weighted average (TWA) assuming the same exposure during the non-sampled period. Details regarding the specific sample collection and analysis methods are included in the industrial hygiene survey report that was prepared for FMS 2. All air sampling results for metals, organic vapors and total particulates in room 231 were either below the limits of detection, or well below the applicable limits.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. One of the surface wipe sample results exceeded the guideline for lead. Sample ILCRARW12, which was collected on the floor in the vault, had a lead concentration of 421 $\mu g/ft^2$. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**
- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**
- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Crestwood Armory. Forty-six of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

For any further questions, please contact Non-Responsive

Appendix	Title	Status
A.	Lead – Wipe Sampling	Attached
B.	Lighting	Attached

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. One of the surface wipe sample results exceeded the guideline for lead. Sample ILCRARW12, which was collected on the floor in the vault, had a lead concentration of 421 µg/ft^2.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Crestwood Armory
Crestwood, Illinois
December 18, 2013

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
Sample ILCRARW11	Room 122, Orderly Room		<91
Sample ILCRARW12	Vault, on Floor		**421**

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
Sample ILCRARW13	Room 189, Family Assistance Center		<91
Sample ILCRARW14	Kitchen, on Range		<91
Sample ILCRARW15	PT Area, Former IFR, at Bullet Trap		164
Sample ILCRARW16	Field Blank	N/A	ND

Notes: 1) µg / ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Forty-six spaces in the facility did not meet the minimum lighting level.

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P February 10, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Decatur Armory, Decatur, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive Certified Industrial Hygienist (CIH), conducted a survey on December 5, 2013 at the Illinois Army National Guard Decatur Armory, 5550 Ocean Trail Road, Decatur, Illinois. The site point of contact was Non-Responsive

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Decatur Armory was built in 1993 and it has about 41,227 square feet of floor space. The armory is the base of operations for Alpha 106th, Delta 106th, HHC 766th Eng BN, and the 766th EN Company FSC. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Decatur Armory had an indoor firing range (IFR) that was closed in approximately 2007 and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: senior walkers and job fairs. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. One of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the vault, had a lead concentration of 434 µg/ft^2. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**
- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Decatur Armory. Forty-one of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

For any further questions, please contact Non-Responsive [redacted]

B.	Lighting	Attached

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. One of the surface wipe sample results exceeded the guideline for lead. Sample ILD2W14, which was collected on the floor in the vault near the gun rack, had a lead concentration of 434 µg/ft^2.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Decatur Armory
Decatur, Illinois
December 5, 2013

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILD2W11	Room 147, Kitchen, on Serving Table		<91
ILD2W12	Caged Storage, Former IFR, at Firing Line		<91

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILD2W13	Caged Storage, Former IFR, at Bullet Trap		94
ILD2W14	Vault, on Floor, near Gun Rack		**434**
ILD2W15	Room 153, Lincoln's Challenge Classroom, on Table		<91
ILD2W16	Field Blank	N/A	ND

Notes: 1) µg / ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P February 6, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Delavan Armory, Delavan, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 4, 2013 at the Illinois Army National Guard Delavan Armory, 206 E. 3rd Street, Delavan, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Delavan Armory was built in 1938 and it has about 28,784 square feet of floor space. The armory is the base of operations for the 1144th Transportation Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Delavan Armory had an indoor firing range (IFR) that was closed and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: senior walkers and Delavan days. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Three of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the storage area (at the firing line in the former IFR) had a lead concentration of 784 µg/ft^2. A sample collected on the floor in the storage area (midrange in the former IFR) had a lead concentration of 2,250 µg/ft^2. A sample collected on the floor in the storage area (at the bullet trap area in the former IFR) had a lead concentration of 23,955 µg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Delavan Armory. Thirty seven of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

The supply room had damaged floor tiles that were suspected asbestos containing materials (ACM). The following actions are required:

- **Damaged suspected asbestos containing floor tiles in the supply room should be analyzed for asbestos content, then repaired or removed and replaced (RAC 2).**

Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Three of the surface wipe sample results exceeded the guideline for lead. Sample ILDEW13, which was collected on the floor in the storage area (at the firing line in the former IFR) had a lead concentration of 784 μg/ft^2. Sample ILDEW14, which was collected on the floor in the storage area (midrange in the former IFR) had a lead concentration of 2,250 μg/ft^2. Sample ILDEW15, which was collected on the floor in the storage area (at the bullet trap area in the former IFR), had a lead concentration of 23,955 μg/ft^2.

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).

2. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

3. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Thirty seven spaces in the facility did not meet the minimum lighting level.

Table B-1
Lighting Measurements
Illinois Army National Guard
Delavan Armory
Delavan, Illinois
December 4, 2013

Locations	Measured Illumination (foot candles)	Required Illumination (foot candles)	Standard Met?
Room 122, Classroom	8-17	50	No
Room 123, Foyer Lobby	5-22	30	No
Room 125, Office	32-35	50	No
Room 124, Hallway	10-13	30	No
Room 126, Office	44-47	50	No
Room 127, Office	40-43	50	No
Room 128, Office	52-71	50	Yes
Room 130, Office	20-21	50	No
Room 129, Hallway	18-23	30	No
Room 131, Men's Latrine	16-25	30	No
Room 133, Corridor	11-12	30	No
Room 134, Copy Room	17-40	50	No
Room 132, Office	51-57	50	Yes
Room 101, Public Lobby	4-11	30	No
Room 104, Corridor	22-23	30	No
Room 103, Men's Restroom	7-33	30	Partially
Room 105, Women's Restroom	22-24	30	No
Room 135, Drill Floor	28-44	50	No
Room 106, Garage	3-14	30	No
Maintenance Office	37-43	50	No
Room 107, Office	78-95	50	Yes
Room 109, Kitchen	19-29	50	No
Room 108, Lobby	14-16	30	No
Room 110, Orderly Room	29-47	50	No
Room 111, Supply	19-21	30	No

Room 112, Vault	23-33	30	Partially
Stage	28-33	30	Partially
Stage Storage	2-7	30	No
Room 119, Passage	5-10	30	No
Room 121, Office	16-18	50	No
Room 120, Lab	17-19	50	No
Room 116, Men's Latrine	18-21	30	No
Room 117, Men's Showers	17-33	30	Partially
Men's Locker Room	10-25	30	No
Library	83-100	50	Yes
Room 115, Hallway	8-12	30	No
Room 118, Conference Room	47-92	50	Partially
Weight Room, former IFR	20-33	50	No
Basement Storage	3-25	30	No
Boiler, Former Coal Storage	0-1	30	No
Boiler Room	5-14	30	No

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

Appendix C
Suspected Asbestos Containing Materials

The supply room had damaged suspected asbestos containing floor tiles. (Figure C-1 and Figure C-2). Damaged suspected asbestos containing floor tiles (ACM) in the supply room should be analyzed for asbestos content, then repaired or removed and replaced.

Figure C-1 Damaged Suspected Asbestos Containing Floor Tiles in Supply Room

Figure C-2 Damaged Suspected Asbestos Containing Floor Tiles in Supply Room

Recommendations:

1. Damaged suspected asbestos containing floor tiles (ACM) in the supply room should be analyzed for asbestos content, then repaired or removed and replaced (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P October 3, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Elgin Armory, Elgin, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on August 7, 2014 at the Illinois Army National Guard Elgin Armory, 254 Raymond St, Elgin, Illinois. The site point of contact was Non-Respon [redacted].

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Elgin Armory was built in 1938. The facility has 31,268 square feet of floor space. The Elgin Armory is the base of operations for Bravo Company 1st Battalion, the 178th Infantry regiment, and the Veterans' Service Office. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Elgin Armory had an indoor firing range that was closed in 1992 and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include training sessions for the Elgin police department. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Six of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the vault had a lead concentration of 233 $\mu g/ft^2$. A sample collected on the floor in unit storage, behind the firing line in the former IFR, had a lead concentration of 1,508 $\mu g/ft^2$. A sample collected on the floor in unit storage, at the firing line in the former IFR, had a lead concentration of 331 $\mu g/ft^2$. A sample collected on the floor in unit storage, midrange in the former IFR,

had a lead concentration of 268 µg/ft^2. A sample collected on the floor against the east wall in unit storage, at the bullet trap in the former IFR, had a lead concentration of 4,190 µg/ft^2. A sample collected on the floor against the west wall in unit storage, at the bullet trap in the former IFR, had a lead concentration of 1,788 µg/ft^2. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**
- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**
- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Elgin Armory. Ten of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

During the walk through, water damage, mold and peeling paint were observed in the women's latrine and shower. The following actions are required:

- **Repair roofs and walls to prevent additional water leakage (RAC 2).**
- **Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).**
- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Six of the surface wipe sample results exceeded the guideline for lead. Sample ILELW12, which was collected on the floor in the vault, had a lead concentration of 233 $\mu g/ft^2$. Sample ILELW14, which was collected on the floor in unit storage, behind the firing line in the former IFR, had a lead concentration of 1,508 $\mu g/ft^2$. Sample ILELW15, which was collected on the floor in unit storage, at the firing line in the former IFR, had a lead concentration of 331 $\mu g/ft^2$. Sample ILELW16, which was collected on the floor in unit storage, midrange in the former IFR, had a lead concentration of 268 $\mu g/ft^2$. Sample ILELW17, which was collected on the floor against the east wall in unit storage, at the bullet trap in the former IFR, had a lead concentration of 4,190 $\mu g/ft^2$. Sample ILELW18, which was collected on the floor against the west wall in unit storage, at the bullet trap in the former IFR, had a lead concentration of 1,788 $\mu g/ft^2$.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

ANALYTICAL REPORT

Submitted To: USPHS / Federal Occupational Health
Denver Federal Center
Denver, CO 80225

Attention: Non-Responsive

Submitted By:

Reference Data: Lead
Sampling Site: NGB: Elgin, IL (Elgin Armory)
Sample Media: Ghost Wipe(s)®
Method Reference: OSHA ID-121
Project ID: Project 11968
DFOH Lab Nos.: TM-14-70499 through TM-14-70509
Date Received: 08/11/14
Data Analyzed: 08/12/14 – 08/13/14
Date Issued: 08/13/14

The wipe samples were hot plate digested. The samples were run on a Perkin Elmer 200 flame and/or Perkin Elmer 600 furnace atomic absorption spectrophotometer (AA).

General Lab Comments:
All quality control criteria have been met.
* All samples received in condition acceptable for analysis unless otherwise noted.
** Sample results have not been corrected for contamination based on the field blank or other analytical blank unless otherwise noted.

Analytical results are given on the enclosed tables. Results relate only to items tested. If you have any questions about these results, feel free to phone the Laboratory at (312) 886-0413.

Water Damage and Mold

During the walk through, water damage, mold and peeling paint were observed in the women's latrine and showers (Figure C-1).

Figure C-1 – Water Damage and Mold on Ceiling Tiles in Women's Latrine and Shower

Recommendations:

1. Repair roofs and walls to prevent additional water leakage (RAC 2).

2. Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).

3. Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P July 6, 2015

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Joliet Armory, Joliet, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on May 29, 2015 at the Illinois Army National Guard Joliet Armory, 2900 W. Jefferson St, Joliet, Illinois. The site point of contact was Non-Responsive .

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Joliet Armory was built in 1958, and it has about 47,987 square feet of floor space. The armory is the base of operations for Detachment 1 Charlie Company 1st Battalion 178th Infantry; the Illinois Department of Veterans Affairs, and Golf Company 634th. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Joliet Armory had an indoor firing range (IFR) that was closed and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: University of St. Francis athletics clubs; Boy Scout meetings; and family assistance. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. None of the nine of the surface wipe sample results exceeded the guideline for lead. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

At the request of site personnel a walk through and visual inspection for water damage and mold was performed. Water damaged ceiling tiles were observed in the maintenance office, conference room, and the cold storage area. The following actions are required:

- **Identity the source of water leaks (RAC 2).**

- **Repair roof leaks to prevent additional water leakage (RAC 2).**

- **Provide better insulation for the cutoff valves on the chilled water lines to prevent condensation, dripping and water damage to ceiling tiles (RAC 2).**

- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Site personnel reported that no asbestos or lead paint surveys for the armory were available for review on the day of the survey. The following actions are required:

- **Based on the age of the building, an asbestos survey should be performed. Asbestos containing materials (ACM) should be identified and armory personnel should be informed of their location as required by 29 CFR 1910.1000(j)(2) (RAC 2).**

- **Based on the age of the building, a lead paint survey should be performed. The survey results should be maintained on site (RAC 2).**

Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table 1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table 1, are considered significant. None of the nine surface wipe sample results exceeded the guideline for lead.

2. **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

3. **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

Water Damage and Mold

At the request of site personnel a walk through and visual inspection for water damage and mold was performed. Water damaged ceiling tiles were observed in the maintenance office, conference room, and in the cold storage area. Personnel reported that condensation and dripping from the cutoff valves on the chilled water was the source of the water damage in the maintenance office and conference room (Figure 1). They also reported that the water damage in the cold storage area was from a roof leak (Figure 2).

Figure 1 - Water Damage on Ceiling Tiles in Conference Room

Figure 2 - Water on Floor From Roof Leak in Cold Storage

Recommendations:

1. **Identity the source of water leaks (RAC 2).**

2. **Repair roof leaks to prevent additional water leakage (RAC 2).**

3. **Provide better insulation for the cutoff valves on the chilled water lines to prevent condensation, dripping and water damage to ceiling tiles (RAC 2).**

4. **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Asbestos Containing Materials and Lead Paint

Site personnel reported that no asbestos or lead paint surveys for the armory were available for review on the day of the survey.

Recommendations:

1. **Based on the age of the building, an asbestos survey should be performed. Asbestos containing materials (ACM) should be identified and armory personnel should be informed of their location as required by 29 CFR 1910.1000(j)(2) (RAC 2).**

2. **Based on the age of the building, a lead paint survey should be performed. The survey results should be maintained on site (RAC 2).**

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P November 8, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Kewanee Armory, Kewanee, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on September 25, 2014 at the Illinois Army National Guard Kewanee Armory, 111 North East St, Kewanee, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Kewanee Armory was built in 1954, and it has about 41,213 square feet of floor space. The armory is the base of operations for HHT and the 2-106th Cavalry Squadron. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kewanee Armory had an indoor firing range (IFR) that was closed in 2002 and converted to a classroom and weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include practices and home games for the Blackhawk College basketball and volleyball teams. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. None of the surface wipe sample results exceeded the guideline for lead. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Kewanee Armory. Three of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

During the walk through, water damage and mold were observed in several areas. Water damaged ceiling tiles and mold growth were observed in the combined classroom and weight room, the stairwell adjacent to the drill floor, the supply sergeant office, and in the hallway across from the HHB office.

Site personnel reported that the ceiling tiles in the supply sergeant office had been replaced in the summer of 2014. The ceiling tile damage observed in the supply sergeant office on the day of the survey indicates that water leaks are continuing. The following actions are required:

- **Repair roofs and walls to prevent additional water leakage (RAC 2).**

- **Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).**

- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. None of the surface wipe sample results exceeded the guideline for lead.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Kewanee Armory
Kewanee, Illinois
September 25, 2014

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILKEAW11	Vault, on floor		58
ILKEAW12	Drill floor, center, on floor		<10

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILKEAW13	Kitchen, on top of oven		<10
ILKEAW14	Classroom, former IFR, at firing line on floor		<10
ILKEAW15	Weight room, former IFR, at bullet trap on floor		<10
ILKEAW16	Field blank	N/A	ND

Notes: 1) $\mu g/ft^2$ = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Three spaces in the facility did not meet the minimum lighting level.

Table B-1
Lighting Measurements
Illinois Army National Guard
Kewanee Armory
Kewanee, Illinois
September 25, 2014

Locations	Measured Illumination (foot candles)	Required Illumination (foot candles)	Standard Met?
Vault	28-37	30	Partially
Supply room	16-46	30	Partially
Supply office	71-85	50	Yes

ARNG-CSG-P November 8, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Machesney Park Armory, Machesney Park, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on September 8, 2014 at the Illinois Army National Guard Machesney Park Armory, 10451 N. 2nd St, Machesney Park, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Machesney Park Armory was built in 1993. The facility has about 53,000 square feet of floor space. The armory is the base of operations for the 33rd BTSB, 135th Chemical Company, Charlie Company RSP, and the Department of Veterans' Affairs. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Machesney Park Armory had an indoor firing range (IFR) that was closed and converted to a supply room and CERF-P room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is used for community activities that include Girl Scout cookie distribution. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. None of the surface wipe sample results exceeded the guideline for lead. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Machesney Park Armory. Eleven of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

During the walk through, water damaged ceiling tiles and mold were observed in the fitness room. The following actions are required:

- **Repair roofs and walls to prevent additional water leakage (RAC 2).**

- **Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).**

- **Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).**

Data Analyzed: 09/15/14 – 09/16/14
Date Issued: 10/15/14

The wipe samples were hot plate digested. The samples were run on a Perkin Elmer 200 flame and/or Perkin Elmer 600 furnace atomic absorption spectrophotometer (AA).

General Lab Comments:
All quality control criteria have been met.
* All samples received in condition acceptable for analysis unless otherwise noted.
** Sample results have not been corrected for contamination based on the field blank or other analytical blank unless otherwise noted.

Analytical results are given on the enclosed tables. Results relate only to items tested. If you have any questions about these results, feel free to phone the Laboratory at (312) 886-0413.

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Eleven spaces in the facility did not meet the minimum lighting level.

Notes: 1) * = burned out light bulbs should be replaced

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

Appendix C
Water Damage and Mold

During the walk through, water damaged ceiling tiles and mold were observed in the fitness room (Figure C-1).

Figure C-1 – Water Damage and Mold on Ceiling Tiles in Fitness room

Recommendations:

1. Repair roofs and walls to prevent additional water leakage (RAC 2).

2. Perform mold abatement. Engage a licensed mold abatement contractor to perform the mold abatement. Mold damaged materials should be removed and discarded or cleaned up to remove mold (RAC 2).

3. Perform periodic inspections to identify sources of water damage. Conduct repairs of water damaged areas as soon as they are identified (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P January 28, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Macomb Armory, Macomb, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 3, 2013 at the Illinois Army National Guard Macomb Armory, 135 W. Grant Street, Macomb, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Macomb Armory was built in 1954 and renovated in 2009. The facility has 43,634 square feet of floor space. The armory is the base of operations for the 44th Chemical Battalion and Bravo Battery 123rd Field Artillery. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed by armory personnel at the facility. The adjacent FMS is permitted to use the armory maintenance bay when additional maintenance space is needed. On the day of survey, an FMS maintenance mechanic was performing an annual service on a FMTV in the maintenance bay.

The Macomb Armory had a firing range that is now closed. The firing range area was decontaminated and converted into a dining hall. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: K-8 basketball games and practice. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. None of the surface wipe sample results exceeded the guideline for lead.

The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**
- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**
- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Macomb Armory. Thirteen of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

For any further questions, please contact Non-Responsive

B.	Lighting	Attached

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. None of the surface wipe sample results exceeded the guideline for lead.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Macomb Armory
Macomb, Illinois
December 3, 2013

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILMBARW11	Vault, on Floor		<91
ILMBARW12	Drill Floor, Center, on Floor		<91

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILMBARW13	Maintenance Bay, on Microwave		<91
ILMBARW14	Kitchen, on Counter		<91
ILMBARW15	Break Room, on Table		<91
ILMBARW16	Field Blank	N/A	ND

Notes: 1) $\mu g/ft^2$ = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P February 10, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Mattoon Armory, Mattoon, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 5, 2013 at the Illinois Army National Guard Mattoon Armory, 112 E. Broadway Ave, Mattoon, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Mattoon Armory was built in 1956 and it has about 34,483 square feet of floor space. The armory is the base of operations for Alpha Company 634th BSB and Lima Company RSP. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Mattoon Armory had an indoor firing range (IFR) that was closed and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is not available for rental for community activities. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. All of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the vault, had a lead concentration of 525 µg/ft^2. A sample collected on the floor in the storage area, at the firing line in the former IFR, had a lead concentration of 74,400 µg/ft^2. A sample collected on the floor in the storage area, midrange in the former IFR, had a lead concentration of 16,800 µg/ft^2. A sample collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 590,000 µg/ft^2. A sample collected on the shelf in room 27 had a lead concentration of 2,050 µg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Mattoon Armory. Fourteen of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. All of the surface wipe sample results exceeded the guideline for lead. Sample ILMTW1, which was collected on the floor in the vault, had a lead concentration of 525 µg/ft^2. Sample ILMTW2, which was collected on the floor in the storage area, at the firing line in the former indoor firing range (IFR), had a lead concentration of 74,400 µg/ft^2. Sample ILMTW3, which was collected on the floor in the storage area, midrange in the former IFR, had a lead concentration of 16,800 µg/ft^2. Sample ILMTW4, which was collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 590,000 µg/ft^2. Sample ILMTW5, which was collected on the shelf in room 27 supply and NBC, had a lead concentration of 2,050 µg/ft^2.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Mattoon Armory
Mattoon, Illinois

Appendix B
Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Fourteen spaces in the facility did not meet the minimum lighting level.

Table B-1
Lighting Measurements
Illinois Army National Guard
Mattoon Armory
Mattoon, Illinois
December 5, 2013

Locations	Measured Illumination (foot candles)	Required Illumination (foot candles)	Standard Met?
Foyer	23-31	30	Partially
Room 13, Office	104-140	50	Yes
Rooms 12 and 7, Office	Not Operable	50	No
Room 6, Office	97-99	50	Yes
Unisex Latrine	20-33	30	Partially
Room 4, Storage	54-96	30	Yes
Room 2, Office	94-107	50	Yes
Room 1, Office	51-55	50	Yes
Room 39, Classroom	83-93	50	Yes
Room 40, Classroom	Not Operable	50	No
Room 38, Classroom	77-113	50	Yes
Room 37, Classroom	70-100	50	Yes
Room 36, Office	81-121	50	Yes
Room 34, Janitor's Closet	28-33	30	Partially
Room 33, Mechanical Room	20-28	30	No
Kitchen	24-56	50	Partially
Room 41, Stage Latrine	63-73	30	Yes
Room 42, Stage Storage	28-31	30	Partially
Stage Fitness Area	33-34	50	No
Room 24, Storage Area	45-50	30	Yes
Room 28, Garage	12-31	30	Partially
Room 43, Mechanical Room	9-22	30	No
Room 27, Supply and NBC Room	33-60	30	Yes
Room 26, Supply	25-76	30	Partially
Room 25, Locker Room	1-63	30	Partially
Men's Latrine and Shower	14-43	30	Partially

Room 22, Office	108-115	50	Yes
Supply Room	31-50	30	Yes
Vault	17-104	30	Yes

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P February 10, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Paris Armory, Paris, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 6, 2013 at the Illinois Army National Guard Paris Armory, 1021 N. Main Street, Paris, Illinois. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Paris Armory was built in 1951 and it has about 31,234 square feet of floor space. The armory is the base of operations for the 1544th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Paris Armory had an indoor firing range (IFR) that was closed and converted to a weight room and storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is generally not available for rental for community activities, but some classrooms are used for drug prevention classes. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Two of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the storage area, midrange in the former IFR, had a lead concentration of 733 µg/ft^2. A sample collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 2,430 µg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Paris Armory. Twenty-three of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

For any further questions, please contact Non-Responsive

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Two of the surface wipe sample results exceeded the guideline for lead. Sample ILPAXW23, which was collected on the floor in the storage area, midrange in the former indoor firing range (IFR), had a lead concentration of 733 µg/ft^2. Sample ILPAXW24, which was collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 2,430 µg/ft^2.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Paris Armory
Paris, Illinois
December 6, 2013

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILPAXW21	Kitchen, on Oven		<91
ILPAXW22	Weight Room, Former IFR, at Firing Line, on Floor		147

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILPAXW23	Storage, Former IFR, Midrange, on Floor		**733**
ILPAXW24	Storage, Former IFR, at Bullet Trap, on Floor		**2,430**
ILPAXW25	Break Room, on Table		<91
ILPAXW26	Field Blank	N/A	ND

Notes: 1) µg / ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).

2. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

3. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P January 29, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Quincy Armory, Quincy, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 3, 2013 at the Illinois Army National Guard Quincy Armory, Non-Responsive. The site point of contact was Non-Responsive

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Quincy Armory was built in 1977, and it has about 28,860 square feet of floor space. The armory is the base of operations for the 1844th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Quincy Armory had an indoor firing range that was closed in the 1990's and converted to classrooms. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is not available for rental for community activities. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. One of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the vault had a lead concentration of 1,280 μg/ft^2. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Quincy Armory. Ten of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

The boiler room was posted with an asbestos warning sign. Water damaged pipe insulation was observed in the boiler room. The following actions are required:

- **Damaged suspected asbestos containing materials (ACM) in the boiler room should be repaired or removed and replaced (RAC 2).**

ARNG-CSG-P November 8, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Rock Falls Armory, Rock Falls, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive Certified Industrial Hygienist (CIH), conducted a survey on September 24, 2014 at the Illinois Army National Guard Rock Falls Armory, Non-Responsive. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Rock Falls Armory is the base of operations for the 1644th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Rock Falls Armory had an indoor firing range (IFR) that was closed in 2004 and converted to a weight room, class room, and janitor's closet. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: high school basketball, Toys for Tots toy distribution, and family Christmas luncheons. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. None of the surface wipe sample results exceeded the guideline for lead. The following actions are required:

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**
- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Rock Falls Armory. Five of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

For any further questions, please contact Non-Responsive

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. None of the surface wipe sample results exceeded the guideline for lead.

Table A-1
Surface Area Wipe Sampling Results for Lead
Illinois Army National Guard
Rock Falls Armory
Rock Falls, Illinois
September 24, 2014

Sample #	Location	Photo	Lead (µg/ft^2)
Surface Guideline			**200**
ILRFAW11	Vault, on floor		24
ILRFAW12	Library, former IFR, at firing line area on floor		<10

Sample #	Location	Photo	Lead ($\mu g/ft^2$)
Surface Guideline			**200**
ILRFAW13	Classroom, former IFR, midrange on radiator		<10
ILRFAW14	Kitchen, on food prep table		<10
ILRFAW15	Drill floor, center on floor		<10
ILRFAW16	Field blank	N/A	ND

Notes: 1) $\mu g/ft^2$ = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Five spaces in the facility did not meet the minimum lighting level.

Office 5	82-86	50	Yes

Recommendations:

1. Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).

National Guard Bureau
Mid-West Regional Industrial Hygiene Office
301-IH Old Bay Lane
Havre de Grace, MD 21078

ARNG-CSG-P February 10, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Sullivan Armory, Sullivan, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 5, 2013 at the Illinois Army National Guard Sullivan Armory, Non-Responsive. The site point of contact was Non-Responsive.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Sullivan Armory was built in 1953 and it has about 31,374 square feet of floor space. The armory is the base of operations for HHQ 634th BSB. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sullivan Armory had an indoor firing range (IFR) that was closed in 1987 and converted to storage. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: elementary and high school basketball and the Girls on the Run program. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Four of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the storage area, at the firing line in the former IFR, had a lead concentration of 5,800 µg/ft^2. A sample collected on the floor in the storage area, midrange in the former IFR, had a lead concentration of 13,000 µg/ft^2. A sample collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 3,600 µg/ft^2. A sample collected on the floor in the vault had a lead concentration of 1,600 µg/ft^2. <u>The following actions are required:</u>

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Sullivan Armory. Twelve of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Four of the surface wipe sample results exceeded the guideline for lead. Sample ILSUW11, which was collected on the floor in the vault, had a lead concentration of 1,600 µg/ft^2. Sample ILSUW13, which was collected on the floor in the storage area, at the firing line in the former indoor firing range (IRF), had a lead concentration of 5,800 µg/ft^2. Sample ILSUW14, which was collected on the floor in the storage area, midrange in the former IFR, had a lead concentration of 13,000 µg/ft^2. Sample ILSUW15, which was collected on the floor in the storage area, at the bullet trap in the former IFR, had a lead concentration of 3,600 µg/ft^2.

Havre de Grace, MD 21078

ARNG-CSG-P February 11, 2014

MEMORANDUM FOR: The Adjutant General for Illinois

SUBJECT: Industrial Hygiene Survey at Urbana Armory, Urbana, Illinois

At the request of the National Guard Bureau (NGB) Mid-West Regional Industrial Hygiene (IH) Office, Non-Responsive, Certified Industrial Hygienist (CIH), conducted a survey on December 6, 2013 at the Illinois Army National Guard Urbana Armory, Non-Responsive. The site point of contact was MSG Adams.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided by site personnel, field measurements, and conditions observed during the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Occupational health risk assessment codes (RACs) are assigned to quantify health risks to personnel in accordance with DOD Letter of Instruction 6055.1, *DOD Safety and Occupational Health Program*. Risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel. RAC descriptors are as follows: 1 = Critical, 2 = Serious, 3 = Moderate, 4 = Minor, and 5 = Negligible.

The Urbana Armory was built in 1938 and renovated in 2012. The facility has about 86,562 square feet of floor space. The armory is the base of operations for the 33rd IBCT Combat Team, Headquarters Company HHC 33rd IBCT, and a Veterans Affairs (VA) office. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. The Urbana Armory had an indoor firing range (IFR) that that was closed and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: Red Cross blood drives and VA job fairs. The industrial hygiene survey included a walkthrough of the facility and interviews with employees.

Wipe samples were collected on representative surfaces in the facility and analyzed for lead. For purposes of this report, any results that exceed the guidelines adopted by the NGB Mid-West Regional IH Office are considered significant. Three of the surface wipe sample results exceeded the guideline for lead. A sample collected on the floor in the vault, had a lead concentration of 430 µg/ft^2. A sample collected on the floor in room 27 (storage area), at the firing line in the former IFR, had a lead concentration of 15,200 µg/ft^2. A sample collected on the floor in room 27 (storage area), at the bullet trap in the former IFR, had a lead concentration of 929 µg/ft^2. The following actions are required:

- **The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2 (RAC 2).**

- **Clean the horizontal surfaces where lead may be present using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).**

- **Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).**

- **When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).**

A lighting survey was conducted in the shops and offices in the Urbana Armory. Forty-one of the areas surveyed did not meet minimum illumination requirements. The following actions are required:

- **Increase the illumination levels in the facility areas that did not meet minimum illumination requirements (RAC 4).**

Appendix A
Lead – Wipe Sampling

Surface Area Wipe Samples

Wipe samples were collected from representative areas of the facility using Environmental Express Ghost™ Wipes and templates in accordance with the OSHA wipe sampling method (OSHA Technical Manual, Appendix II, 2-1). In addition, surface wipe samples were collected in the kitchen to assess migration of lead into food handling spaces. The samples were analyzed for lead by OSHA Method ID-121. The results and photos are contained in Table A-1.

The Occupational Safety and Health Administration (OSHA) requires that all surfaces must be kept as free as practicable of accumulations of toxic metal dusts (29 CFR 1910). In addition, DOD has instituted a new policy to minimize surface contamination levels of heavy metals (*Control and Management of Surface Accumulations from Lead, Hexavalent Chromium, and Cadmium Operations*, DTM 12-003, 18 April 2012).

The NGB Mid-West Regional IH Office has adopted the guidelines for metal dust published in NG Pam 420-15, *Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges* and the Department of Energy (DOE)/ Brookhaven National Laboratory (BNL) *Surface Wipe Sampling Procedure* (IH75190). Any results that exceed these guidelines, which are shown in Table A-1, are considered significant. Three of the surface wipe sample results exceeded the guideline for lead. Sample ILURW1, which was collected on the floor in the vault, had a lead concentration of 430 µg/ft^2. Sample ILURW2, which was collected on the floor in room 27 (storage area), at the firing line in the former indoor firing range (IFR), had a lead concentration of 15,200 µg/ft^2. Sample ILURW3, which was collected on the floor in room 27 (storage area), at the bullet trap in the former IFR, had a lead concentration of 929 µg/ft^2.

Notes: 1) µg/ft^2 = micrograms per square foot of surface area. 2) ND = none detected. 3) "<" means less than the reporting limit for the analytical method.

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft2 (RAC 2).

2. Clean the horizontal surfaces where lead may be present by using high-efficiency particulate air (HEPA) filter vacuums or wet methods (RAC 2).

3. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items (RAC 3).

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition (RAC 2).

Lighting

Illumination levels were measured with an Extech Instruments Model 407026 Light Meter calibrated according to the manufacturer's specifications. The results were compared with the recommendations in the National Guard Bureau Facility Design Guides and the American National Standards Institute/Illuminating Engineering Society of North America RP-1 (Offices) and RP-7 (Industrial Facilities) guidelines. The results and the lighting criteria are contained in Table B-1. Forty-one spaces in the facility did not meet the minimum lighting level.

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Paris Armory, located in Paris, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Paris Armory was built in 1951, and has 31,234 square feet of floor space. The armory is the base of operations for the 1544th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The armory had an indoor firing range (IFR) that was closed about twenty years ago and converted to a weight room and storage area. Used targets are kept in the former IFR storage area. Site personnel reported that the armory is not rented out for community activities. The armory may be used for a family Christmas dinner party.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Three of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected on the floor in the former IFR (about mid-range) had a lead concentration of 814 ug/ft^2. A sample collected on the floor in the former IFR (at the bullet trap area) had a lead concentration of 595 ug/ft^2. A sample collected on the floor in the vault had a lead concentration of 6,818 ug/ft^2.

The armory should clean up the areas where lead contamination has been identified. Used targets should be removed from the former indoor firing range area. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

The armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas.

A lighting survey was conducted in the offices and storage areas in the Paris Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Paris Armory, located in Paris, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 14, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Paris Armory was built in 1951, and has 31,234 square feet of floor space. The armory is the base of operations for the 1544th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The Paris Armory had an indoor firing range (IFR) that was closed about twenty years ago and converted to a weight room and storage area. Used targets are kept in the former IFR storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not rented out for community activities. The armory may be used for a family Christmas dinner party.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Paris Armory

V. Findings, Discussion, and Recommendations

The armory is the base of operations for the 1544th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Paris Armory had a firing range that was closed about twenty years ago and converted to a weight room and storage area. Used targets are kept in the former IFR storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Three of the surface wipe sample results exceeded the NGB criteria. Sample ILPAXW12, which was collected on the floor in the former IFR (about mid-range) had a lead concentration of 814 ug/ft^2. Sample ILPAXW13, which was collected on the floor in the former IFR (at the bullet trap area) had a lead concentration of 595 ug/ft^2. Sample ILPAXW14, which was collected on the floor in the vault had a lead concentration of 6,818 ug/ft^2.

The Paris Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. The armory should clean up the areas where lead contamination has been identified. Used targets (Figures 3 and 4) should be removed from the former indoor firing range area. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Appendix B

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, East St. Louis Armory, located in East St. Louis, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The East St. Louis Armory is the base of operations for the 1344th Transportation Company Regional RSP Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The East St. Louis Armory had an indoor firing range (IFR) that was closed in 1992. The IFR was equipped with a bullet trap and firing range ventilation system. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include serving as a polling place for voting and a Lincoln's challenge youth group.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Three of the surface wipe sample results exceeded the above criteria. A sample collected on the bullet trap in the firing range had a lead concentration of 360,000 ug/ft^2 and a chromium concentration of 510 ug/ft^2. A sample collected in the firing range in the center of the room had a lead concentration of 480 ug/ft^2. A sample collected in vault two on the floor had a lead concentration of 420 ug/ft^2. The East St. Louis Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the East St. Louis Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, East St. Louis Armory, located in East St. Louis, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 5, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The East St. Louis Armory was built in 1952. The facility has 45,539 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The drill floor has a concrete floor, concrete block walls that are about twenty two feet high, and metal columns and beams that support a gabled roof that is about thirty two feet high in the center. The office and classroom areas have tile or carpet floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer.

The East St. Louis Armory is the base of operations for the 1344th Transportation Company Regional RSP Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The East St. Louis Armory had an indoor firing range (IFR) that was closed in 1992. The IFR was equipped with a bullet trap and firing range ventilation system. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include serving as a polling place for voting and a Lincoln's challenge youth group.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – East St. Louis Armory

Figure 2 – IFR in East St. Louis Armory

VI. Findings, Discussion, and Recommendations

The East St. Louis Armory is the base of operations for the 1344th Transportation Company Regional RSP Program. Site personnel reported that no vehicle maintenance is performed at the armory. The East St. Louis Armory had an IFR that was closed in 1992. The IFR was equipped with a bullet trap and firing range ventilation system. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Three of the surface wipe sample results exceeded the above criteria. Sample ILESXW1 which was collected in the firing range on the bullet trap had a lead concentration of 360,000 ug/ft^2 and a chromium concentration of 510 ug/ft^2. Sample ILESXW2 which was collected in the firing range in the center of the room had a lead concentration of 480 ug/ft^2. Sample ILESXW3 which was collected in vault two on the floor had a lead concentration of 420 ug/ft^2. The East St. Louis Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Carbondale Armory, located in Carbondale, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Carbondale Armory was built in 1938. The facility has 32,499 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The Carbondale Armory is the base of operations for C Company; 33rd Brigade Special Troops Battalion (BSTB). During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Carbondale Armory had a firing range that was closed in 1997 and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include: basketball practice; the local park district father and daughter dance; and soccer practice.

Ten samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Four of the surface wipe sample results exceeded the above criteria. Sample ILCAXW2 which was collected in the drill floor area, on an overhead space heater twelve feet above the floor, had a lead concentration of 530 ug/ft^2. Sample ILCAXW3 which was collected in the basement, on the floor at the bullet tray, had a lead concentration of 270,000 ug/ft^2. Sample ILCAXW4 which was collected in the basement, on the floor of the steam tunnel, had a lead concentration of 8,500 ug/ft^2. Sample ILCAXW5 which was collected in the basement, on a locker in the center of the room, had a lead concentration of 700 ug/ft^2. The Carbondale Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Site personnel reported concerns regarding water damage and potential mold growth in room 108 and room 110. Water damage to ceilings, walls and floors was observed in both of these areas. The source of the water leaks should be identified and repaired. After the water leaks have been repaired, mold monitoring should be performed and the water damaged areas should be repaired.

A lighting survey was conducted in the offices and storage areas in the Carbondale Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Carbondale Armory, located in Carbondale, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 2, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Carbondale Armory was built in 1938. The facility has 32,499 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, concrete walls and a sloping concrete roof. The office and classroom areas have tile or carpet floors, concrete walls and suspended ceilings. The exterior of the building is concrete.

The Carbondale Armory is the base of operations for C Company; 33rd Brigade Special Troops Battalion (BSTB). During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Carbondale Armory had a firing range that was closed in 1997 and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: basketball practice for Trinity School (K-8); the local park district father and daughter dance; and soccer practice.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Carbondale Armory

VI. Findings, Discussion, and Recommendations

The Carbondale Armory is the base of operations for C Company; 33rd Brigade Special Troops Battalion (BSTB). Site personnel reported that no vehicle maintenance is performed at the armory. The Carbondale Armory had a firing range that was closed in 1997 and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Ten samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). The results are contained in Table 1. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Four of the surface wipe sample results exceeded the above criteria. Sample ILCAXW2 which was collected in the drill floor area, on an overhead space heater twelve feet above the floor, had a lead concentration of 530 ug/ft^2. Sample ILCAXW3 which was collected in the basement, on the floor at the bullet tray, had a lead concentration of 270,000 ug/ft^2. Sample ILCAXW4 which was collected in the basement, on the floor of the steam tunnel, had a lead concentration of 8,500 ug/ft^2. Sample ILCAXW5 which was collected in the basement, on a locker in the center of the room, had a lead concentration of 700 ug/ft^2.

The Carbondale Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special

attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 144 inches squared (in^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Carbondale Armory, located in Carbondale, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Carbondale Armory has two buildings, an armory and a separate vehicle maintenance building. The facility was built in 2010, and has 53,702 square feet of floor space. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the vehicle maintenance building is primarily used for vehicle and equipment storage, but has the potential to be used to service Humvees and tractor trailers. No vehicle maintenance was performed on the day of the survey. The Carbondale Armory does not have a firing range. Weapons may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not used for community activities.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). One of the surface wipe sample results exceeded the NGB surface wipe sampling criteria for metals. A sample collected on the Lincoln welder in the maintenance bay had a cadmium concentration of 42 ug/ft^2. The Carbondale Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Carbon monoxide is an odorless, colorless toxic gas that is a product of incomplete combustion. Maintenance activities may require personnel to run engines while they are in the vehicle maintenance building. During the winter months, maintenance may be performed with the bay doors closed. The vehicle maintenance building was not equipped with carbon monoxide gas detectors. If maintenance activities require personnel to test engines while they are idling in the maintenance bays, carbon monoxide monitors should be installed in the vehicle maintenance building.

No vehicle maintenance was scheduled or performed on the day of the survey. Personal exposure monitoring for potential airborne contaminants and noise should be scheduled and conducted when vehicle maintenance is performed in the maintenance bays.

A lighting survey was conducted in the offices, support and storage areas in the Carbondale Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Carbondale Armory, located in Carbondale, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 10, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Carbondale Armory has two buildings, an armory and a separate vehicle maintenance building. The facility was built in 2010, and has 53,702 square feet of floor space. The Carbondale Armory is the base of operations for Detachment 1, 1344th Transportation Company; the 347th Replacement Battalion; the 825th Replacement Battalion; and Company C, 33rd Brigade Special Troops Battalion.

During the week, most of the activities at the armory involve administrative work. Site personnel reported that the vehicle maintenance building is primarily used for vehicle and equipment storage, but has the potential to be used to service Humvees and tractor trailers. No vehicle maintenance was performed on the day of the survey. The vehicle maintenance building is equipped with a tailpipe local exhaust ventilation system.

The Carbondale Armory does not have a firing range. Weapons may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not used for community activities.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination; an evaluation of the tailpipe ventilation system; and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Carbondale Armory

Figure 2 – Carbondale Armory - Vehicle Maintenance Building

V. Findings, Discussion, and Recommendations

The Carbondale Armory is the base of operations for Detachment 1, 1344th Transportation Company; the 347th Replacement Battalion; the 825th Replacement Battalion; and Company C, 33rd Brigade Special Troops Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the vehicle maintenance building is primarily used for vehicle and equipment storage, but has the potential to be used to service Humvees and 916 tractor trailers. No vehicle maintenance was performed on the day of the survey.

The Carbondale Armory does not have a firing range. Weapons may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not used for community activities.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). The results are contained in Table 1. Wipe sample locations are identified in Figure 3. The NGB surface wipe sampling criteria for metals are contained in Table 2.

One of the surface wipe sample results exceeded the NGB criteria. Sample ILCAW14 which was collected on the Lincoln welder in the maintenance bay had a cadmium concentration of 42 ug/ft^2. The Carbondale Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Ventilation Systems

Carbon Monoxide Detection Systems

Carbon monoxide is an odorless, colorless toxic gas that is a product of incomplete combustion. Maintenance activities may require personnel to run engines while they are in the vehicle

maintenance building. During the winter months, maintenance may be performed with the bay doors closed. The vehicle maintenance building was not equipped with carbon monoxide gas detectors. If maintenance activities require personnel to test engines while they are idling in the maintenance bays, carbon monoxide monitors should be installed in the vehicle maintenance building.

Tailpipe Local Exhaust Ventilation (LEV) Systems

The vehicle maintenance building is equipped with two tailpipe LEV systems. The shop has the potential to be used to service Humvees and tractor trailers. The tailpipe LEV systems had eight inch diameter flexible exhaust ducts.

Tailpipe local exhaust ventilation systems (Figure 4) in maintenance bays were tested. The results are contained in Table 3. The NGB ventilation criteria for maintenance shops are contained in Table 4. Both of the tailpipe exhaust ventilation systems met the NGB ventilation criteria for maintenance shops that service vehicles with diesel engine displacements ranging up to 736 in^3.

Table 3
Tailpipe Local Exhaust Ventilation Measurements
Illinois Army National Guard
Carbondale Armory Vehicle Maintenance Building
Carbondale, Illinois
December 10, 2012

Duct location	Duct diameter (inches)	Exhaust flow rate (cfm)
East Tailpipe	8	1,248
West Tailpipe	8	1,243

Table 4
NGB Ventilation Criteria for Maintenance Shops

Location	Ventilation Criteria	Basis for Criteria
Tailpipe Local Exhaust Ventilation for vehicles that have diesel engine displacements ranging up to 0.426 ft^3 (736 in^3). (e.g., LMTV, 5-ton, Humvee, and HEMTT)	800 cubic feet per minute (CFM) when diesel engines are idling.	ACGIH Industrial Ventilation Manual 26th Edition Figure VS-85-02 ARNG-CSG-P Information Paper 1 June 2011
Tailpipe Local Exhaust Ventilation for vehicles that have diesel engine displacements greater than 0.426 ft^3 (736 in^3). (e.g., Caterpillar Scraper 621B, 0.516 ft^3)	Develop a list of vehicles that are serviced in the maintenance bays and submit the list to the Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office for specific guidance regarding acceptable tailpipe exhaust ventilation.	ACGIH Industrial Ventilation Manual 26th Edition Figure VS-85-02 ARNG-CSG-P Information Paper 1 June 2011

No vehicle maintenance was scheduled or performed on the day of the survey. Personal exposure monitoring for potential airborne contaminants and noise should be scheduled and conducted when vehicle maintenance is performed in the maintenance bays.

Recommendations:

1. If maintenance activities require personnel to test engines while they are idling in the maintenance bays, carbon monoxide monitors should be installed in the vehicle maintenance building. **(RAC 2)**

2. Observe NGB recommended LEV exhaust flow rates when operating or testing engines in maintenance bays. **(RAC 2)**

3. Personal exposure monitoring for potential airborne contaminants and noise should be scheduled and conducted when vehicle maintenance is performed in the maintenance bays. **(RAC 2)**

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Local Exhaust Ventilation Measurements

A TSI Velocicalc was used to measure general exhaust ventilation flow rates and the tailpipe exhaust systems. The TSI Velocicalc had been calibrated according to the manufacturer's specifications. Local exhaust ventilation findings were evaluated based on criteria established by the ACGIH in its publication *Industrial Ventilation, A Manual of Recommended Practices,* 27th Edition, and by OSHA 29 CFR 1910.94, 106, and 252 ventilation requirements.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Champaign Armory, located in Champaign, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Champaign Armory was built in 1938. The facility has 28,899 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, poured concrete walls that are 21 feet high and a gabled roof that is supported by poured concrete trusses. The office and classroom areas have tile floors, poured concrete walls and suspended ceilings. The exterior of the building is masonry.

The Champaign Armory is the base of operations for the Bravo Company 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Champaign Armory had a firing range in the basement that was closed about 20 years ago and is now a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory has not been used for community activities in over four years.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Four samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILCHW3 was collected on the floor at the east end of the locker room where the bullet trap for the firing range was previously located. This sample had a lead concentration of 5,200 ug/ft^2. The Champaign Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Champaign Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Champaign Armory, located in Champaign, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 1, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Champaign Armory was built in 1938. The facility has 28,899 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, poured concrete walls that are 21 feet high and a gabled roof that is supported by poured concrete trusses. The office and classroom areas have tile floors, poured concrete walls and suspended ceilings. The exterior of the building is masonry.

The Champaign Armory is the base of operations for the Bravo Company 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Champaign Armory had a firing range in the basement that was closed about 20 years ago and is now a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory has not been used for community activities in over four years.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Champaign Armory

VI. Findings, Discussion, and Recommendations

The Champaign Armory is the base of operations for the Bravo Company 634th Brigade Support Battalion. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Area Wipe Samples

Four samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILCHW3 was collected on the floor at the east end of the locker room where the bullet trap for the firing range was previously located. This sample had a lead concentration of 5,200 ug/ft^2. The Champaign Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Table 1
Area Wipe Sampling Results for Metals
Illinois Army National Guard
Champaign Armory
Champaign, Illinois
April 1, 2010

Analyte	ILCHW1 (ug/ft^2) Kitchen – on Countertop	ILCHW2 (ug/ft^2) Drill Floor – Center of Floor	ILCHW3 (ug/ft^2) Basement Locker Room – East End on Floor (Former Bullet Trap Area)
Lead	<91	<91	**5,200**
Cadmium	<9.1	<9.1	<9.1
Chromium	<91	<91	<91

Analyte	ILCHW4 (ug/ft^2) Vault – on Weapon Storage Locker	ILCHW5 (ug/ft^2) Field Blank
Lead	<91	ND
Cadmium	14	ND
Chromium	<10	ND

Note:
1) ug/ft^2= micrograms per square foot of surface area. 2) **Bold** indicates that concentration was "significant."
3) ND = None Detected

Recommendations:

1. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

2. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Decatur Armory, located in Decatur, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Decatur Armory was built in 1993. The facility has 41,277 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The Decatur Armory is the base of operations for HHC 766th Engineer Battalion, FSC 766th Engineer Battalion, Alpha and Delta Company of 106th Aviation, and Det. 1 Company C of 1-376th Aviation. During the week, most of the activities at the armory involve administrative work. Site personnel reported no vehicle maintenance is performed at the armory. The Decatur Armory had an indoor firing range that has been closed and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not available for rental for community activities.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Decatur Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Decatur Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office and storage areas.

Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria.	Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. Continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.	4 4 2
Lighting		
A lighting survey was conducted in the offices and storage areas in the Decatur Armory. Most of the areas surveyed did not meet minimum illumination requirements.	Illumination levels should be improved in some office, and storage areas.	4

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Decatur Armory, located in Decatur, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 3, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Decatur Armory was built in 1993. The facility has 41,277 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a poured concrete floor, concrete block walls that are twenty feet high and a sloped roof that is supported by exposed metal trusses. The office and classroom areas have carpeted floors, gypsum walls and suspended ceilings. The exterior of the building is brick veneer.

The Decatur Armory is the base of operations for HHC 766th Engineer Battalion, FSC 766th Engineer Battalion, Alpha and Delta Company of 106th Aviation, and Det. 1 Company C of 1-376th Aviation. During the week, most of the activities at the armory involve administrative work. Site personnel reported no vehicle maintenance is performed at the armory. The Decatur Armory had an indoor firing range that has been closed and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not available for rental for community activities.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Decatur Armory

VI. Findings, Discussion, and Recommendations

The Decatur Armory is the base of operations for HHC 766th Engineer Battalion, FSC 766th Engineer Battalion, Alpha and Delta Company of 106th Aviation, and Det. 1 Company C of 1-376th Aviation. During the week, most of the activities at the armory involve administrative work. Site personnel reported no vehicle maintenance is performed at the armory. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Decatur Armory should continue to prohibit the presence of food and drink in work areas, stress the

importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Delavan Armory, located in Delavan, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Delavan Armory was built in 1938. The facility has 28,784 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The weapons vault was not accessible on the day of the survey. The drill floor has a wood floor, concrete walls that are about 20 feet high and a poured concrete roof that is arched. The office and classroom areas have carpeted floors, concrete walls and poured concrete ceilings. The exterior of the building is brick veneer.

The Delavan Armory is the base of operations for Detachment 1 of the 1744th Transportation Company and Headquarters, Headquarters Detachment, of the 1144th Transportation Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Delavan Armory had an indoor firing range in the basement that has been closed for over eight years. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that include: American Legion Memorial Day services; as a backup site for outdoor band concerts in the summertime; senior citizens who walk the perimeter of the drill floor in the wintertime; and informal use of the basketball court on the drill floor.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILDEW5, which was collected on the floor of the former indoor firing range in the basement, had a lead concentration of 11,000 ug/ft^2. The Delavan Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage

areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

During the walkthrough, employees expressed concerns about water intrusion in the former coal chute area in the basement. The source of the water intrusion in the former coal chute area in the basement should be identified and repaired. Water damage in the former coal chute area should be cleaned up.

A lighting survey was conducted in the offices and storage areas in the Delavan Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Dixon Armory, located in Dixon, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Dixon Armory was built in 1938 and it has about 28,095 square feet of floor space. The armory is the base of operations for Troop B, 2-106th Cavalry Squadron. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. Site personnel reported that the armory had an indoor firing range that was closed in the mid 1980s and converted to a platoon storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that include: senior walkers; park district basketball and volleyball; and YMCA soccer for kindergarten through 8th grade children.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Two of the surface wipe sample results exceeded the NGB guideline for lead. A sample collected in the basement (in the former IFR at the firing line area) had a lead concentration of 6,473 ug/ft^2. A sample collected in the basement (in the former IFR at the bullet trap area) had a lead concentration of 7,805 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The Dixon Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Dixon Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Dixon Armory, located in Dixon, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 10, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Dixon Armory was built in 1938 and it has about 28,095 square feet of floor space. The armory is the base of operations for Troop B, 2-106th Cavalry Squadron. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. Site personnel reported that the armory had an indoor firing range that was closed in the mid 1980s and converted to a platoon storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that include: senior walkers; park district basketball and volleyball; and YMCA soccer for kindergarten through 8th grade children.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Dixon Armory

V. Findings, Discussion, and Recommendations

The Dixon Armory is the base of operations for Troop B, 2-106th Cavalry Squadron. Site personnel reported that no vehicle maintenance is performed at the armory. The armory had an indoor firing range that was closed in the mid 1980s and converted to a platoon storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that include: senior walkers; park district basketball and volleyball; and YMCA soccer for kindergarten through 8th grade children.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling guideline for lead is contained in Table 2.

Two of the surface wipe sample results exceeded the NGB guideline. Sample ILDXW4, which was collected in the basement (in the former IFR at the firing line area) had a lead concentration of 6,473 ug/ft^2. Sample ILDXW5, which was collected in the basement (in the former IFR at the bullet trap area) had a lead concentration of 7,805 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and

Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The Dixon Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

3) ND = None Detected

Table 2
NGB Surface Wipe Sampling Guideline for Lead

Metal	Acceptable Surface Level ug/ft^2	Basis for Criteria
Lead	200	NG Pam 420-15

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. (**RAC 2**)

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

3. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5

B. Methodology and Assessment Criteria.

C. Laboratory Result Reports and Chain of Custody Sheets.

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, East St. Louis Armory, located in East St. Louis, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The East St. Louis Armory was built in 1952, and has 45,539 square feet of floor space. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The East St. Louis Armory has an indoor firing range (IFR). Site personnel reported that the IFR is inactive and that access to the range is restricted. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include a polling place and Lincoln`s Academy Challenge.

Nine samples were collected on representative surfaces in the facility and analyzed for lead. Five of the surface wipe sample results exceeded the NGB criteria. A sample collected on the bullet trap in the IFR, had a lead concentration of 18,000 ug/ft^2. A sample collected on the floor near the bullet trap in the IFR, had a lead concentration of 9,591 ug/ft^2. A sample collected on the floor, in the firing line area of the IFR, had a lead concentration of 376 ug/ft^2. A sample collected on the floor, in the center of the IFR, had a lead concentration of 315 ug/ft^2. A sample collected on a cabinet in the IFR had a lead concentration of 891 ug/ft^2.

The IFR in the armory had lead contamination on all surfaces that were tested. Site personnel reported that the firing range is no longer used. Access to the IFR should continue to be restricted. The armory should perform a lead abatement in the IFR. All surfaces and objects in the IFR should be decontaminated.

The East St. Louis Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, East St. Louis Armory, located in East St. Louis, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 7, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The East St. Louis Armory was built in 1952. The facility has 45,539 square feet of floor space. The armory is the base of operations for the 134th Transportation Company, and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The East St. Louis Armory has an indoor firing range (IFR). Site personnel reported that the IFR is inactive and that access to the range is restricted. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include a polling place and Lincoln`s Academy Challenge.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – East St. Louis Armory

V. Findings, Discussion, and Recommendations

The East St. Louis Armory is the base of operations for the 134th Transportation Company, and the Recruit Sustainment Program. Site personnel reported that no vehicle maintenance is performed at the armory.

The East St. Louis Armory has an IFR. Site personnel reported that the IFR is inactive and that access to the range is restricted. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include a polling place and Lincoln`s Academy Challenge.

Surface Wipe Samples

Nine samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Five of the surface wipe sample results exceeded the NGB criteria. Sample ILESXW12, which was collected on the floor, in the firing line area of the IFR, had a lead concentration of 376 ug/ft^2. Sample ILESXW13, which was collected on the floor, in the center of the IFR, had a lead concentration of 315 ug/ft^2. Sample ILESXW14, which was collected on a cabinet in the IFR,

had a lead concentration of 891 ug/ft^2. Sample ILESXW15, which was collected on the bullet trap in the IFR, had a lead concentration of 18,000 ug/ft^2. Sample ILESXW16, which was collected on the floor near the bullet trap in the IFR, had a lead concentration of 9,591 ug/ft^2.

The IFR in the armory had lead contamination on all surfaces that were tested. Site personnel reported that the IFR is inactive and that access to the range is restricted. The armory should perform a lead abatement in the IFR. All surfaces and objects in the IFR should be decontaminated. Access to the IFR should continue to be restricted.

The East St. Louis Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Effingham Armory, located in Effingham, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Effingham Armory was built in 1958 and encompasses about 22,050 square feet of floor space. The armory is the base of operations for Company B 2nd Battalion 130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Effingham Armory had an indoor firing range (IFR) that was closed approximately twenty years ago, and is now used for storage. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Community activities at the armory include the use of classrooms for motorcycle rider training.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Two of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected on the bullet trap in the basement (in the former IFR), had a lead concentration of 267 ug/ft^2. A sample collected on the floor in the basement (at the bullet trap area in the former IFR), had a lead concentration of 7,318 ug/ft^2.

The Effingham Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. The armory should clean up the areas where lead contamination has been identified. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

The armory has Val 6 Shizuoka Seiki infrared oil heaters that may be used to heat the drill floor in case of an emergency. If the oil heaters are used to heat the armory appropriate ventilation, as specified by the manufacturer, should be provided and carbon monoxide monitors should be installed to warn personnel about potential exposure.

A lighting survey was conducted in the offices and storage areas in the Effingham Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Effingham Armory, located in Effingham, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 13, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Effingham Armory was built in 1958 and encompasses about 22,050 square feet of floor space. The armory is the base of operations for Company B 2nd Battalion 130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Effingham Armory had an indoor firing range (IFR) that was closed approximately twenty years ago, and is now used for storage. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Community activities at the armory include the use of classrooms for motorcycle rider training.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Effingham Armory

V. Findings, Discussion, and Recommendations

The Effingham Armory is the base of operations for Company B 2nd Battalion 130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Effingham Armory had an IFR that was closed approximately twenty years ago, and is now used for storage. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Community activities at the armory include the use of classrooms for motorcycle rider training.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Two of the surface wipe sample results exceeded the NGB criteria. Sample ILEFXW3, which was collected on the bullet trap in the basement (in the former IFR), had a lead concentration of 267 ug/ft^2. Sample ILEFXW4, which was collected on the floor in the basement (at the bullet trap area in the former IFR), had a lead concentration of 7,318 ug/ft^2. The Effingham Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal

surfaces in work and storage areas. The armory should clean up the areas where lead contamination has been identified. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

Recommendation:

Increase the illumination levels in the areas that did not meet minimum illumination requirements. (**RAC 4**)

Use of Portable Diesel Fuel Space Heaters

Site personnel reported that the armory has been without central heat for about 2 years. On the day of the survey, they were using portable diesel fuel space heaters to heat the drill floor and armory (Figure 3). On the day of the survey, two Val 6 Shizuoka Seiki infrared oil heaters were in use on the drill floor (Figure 4). The heaters were equipped with warning labels that indicated ventilation was required if used indoors (Figure 5). Site personnel indicated that facilities intended to upgrade the heating system within the next two weeks. During a follow-up telephone call on 2/21/13, Jeremy Wenthe reported that the Val 6 Shizuoka Seiki infrared oil heaters were no longer used to heat the drill floor. He indicated that infrared tube heaters were installed on the rafters in the drill floor area during the second week of January, 2012, and that offices were heated by upgraded electric space heaters.

The Val 6 Shizuoka Seiki infrared oil heaters are still stored on the drill floor, and may be used in case of an emergency. If the Val 6 Shizuoka Seiki infrared oil heaters are used to heat the armory appropriate ventilation, as specified by the manufacturer, should be provided. Carbon monoxide is an odorless, colorless toxic gas that is a byproduct of diesel fuel combustion. If the Val 6 Shizuoka Seiki infrared oil heaters are used to heat the armory, carbon monoxide monitors should be installed to warn personnel about potential exposure.

Recommendations:

1. If the Val 6 Shizuoka Seiki infrared oil heaters are used to heat the armory appropriate ventilation, as specified by the manufacturer, should be provided. (**RAC 2**)

2. If the Val 6 Shizuoka Seiki infrared oil heaters are used to heat the armory carbon monoxide monitors should be installed to warn personnel about potential exposure. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Freeport Armory, located in Freeport, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Freeport Armory was built in 1958 and it has about 21,817 square feet of floor space. The armory is the base of operations for the 333rd Military Police Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Freeport Armory had an indoor firing range that was closed in the 1970s and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: classroom use by law enforcement personnel about three times per year; and meetings of the Northwest Illinois Criminal Justice Commission.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB guideline for lead. The Freeport Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Freeport Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Freeport Armory, located in Freeport, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 10, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Freeport Armory was built in 1958 and it has about 21,817 square feet of floor space. The armory is the base of operations for the 333rd Military Police Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Freeport Armory had an indoor firing range that was closed in the 1970s and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: classroom use by law enforcement personnel about three times per year; and meetings of the Northwest Illinois Criminal Justice Commission.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Freeport Armory

V. Findings, Discussion, and Recommendations

The Freeport Armory is the base of operations for the 333rd Military Police Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The Freeport Armory had an indoor firing range that was closed in the 1970s and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling guideline for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB guideline. The Freeport Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Galva Armory, located in Galva, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Galva Armory was built in 1953, and it has 32,864 square feet of floor space. The armory is the base of operations for Delta Company 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Galva Armory had an indoor firing range that was closed and converted to a dining area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: senior walkers; junior high school girl's basketball practice; eighth grade graduation ceremonies; and Red Cross blood drives.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Galva Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Galva Armory. Most of the areas surveyed met minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Galva Armory, located in Galva, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Mr. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on March 1, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Galva Armory was built in 1953, and it has 32,864 square feet of floor space. The armory is the base of operations for Delta Company 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Appendix D

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Galva Armory, located in Galva, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Galva Armory was built in 1953. The facility has 32,864 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The Galva Armory is the base of operations for Delta Company 634th Battalion Support Brigade. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Galva Armory had an indoor firing range that was closed about 15 years ago and converted to a dining area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: girl's basketball practice several days per week; auctions; and eighth grade graduation ceremonies.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILGLW5 which was collected on a workbench in the maintenance bay had a lead concentration of 240 ug/ft^2. The Galva Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Galva Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Galva Armory, located in Galva, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on July 2, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Galva Armory was built in 1953. The facility has 32,864 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, concrete block walls that are twenty two feet high and an arched roof that is supported by exposed metal beams. The office and classroom areas have tile or carpeted floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer.

The Galva Armory is the base of operations for Delta Company 634th Battalion Support Brigade. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Galva Armory had an indoor firing range that was closed about 15 years ago and converted to a dining area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: girl's basketball practice several days per week; auctions; and eighth grade graduation ceremonies.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Galva Armory

VI. Findings, Discussion, and Recommendations

The Galva Armory is the base of operations for Delta Company 634th Battalion Support Brigade. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILGLW5 which was collected on a workbench in the maintenance bay had a lead concentration of 240 ug/ft^2. The Galva Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Joliet Armory, located in Joliet, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Joliet Armory was built in 1958. The facility has 47,987 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The Joliet Armory is the base of operations for Echo Company 634th BSB and Det. 1 Charlie 1-178th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported no major vehicle maintenance is performed at the armory.

The Joliet Armory had an indoor firing range (IFR) that was closed about ten years ago and is now a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include basketball, baseball and softball practice for St. Francis College.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Three samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. A sample collected on the floor of the locker room had a lead concentration of 452 ug/ft^2. The Joliet Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Joliet Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, classroom and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Joliet Armory, located in Joliet, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 15, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Joliet Armory was built in 1958. The facility has 47,987 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The Joliet Armory is the base of operations for Echo Company 634th BSB and Det. 1 Charlie 1-178th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported no major vehicle maintenance is performed at the armory. The Joliet Armory had an indoor firing range (IFR) that was closed about ten years ago and is now a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include basketball, baseball and softball practice for St. Francis College.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Joliet Armory

Figure 2 – Drill Floor - Joliet Armory

VI. Findings, Discussion, and Recommendations

The Joliet Armory is the base of operations for Echo Company 634th BSB and Det. 1 Charlie 1-178th Infantry. Site personnel reported no major vehicle maintenance is performed at the armory. The Joliet Armory had an indoor firing range that was closed about ten years ago and is now a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include basketball, baseball and softball practice for St. Francis College.

Surface Wipe Samples

Three samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILJOXW2 which was collected on the floor of the locker room (the location of the former IFR) had a lead concentration of 452 ug/ft^2. The Joliet Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Joliet Armory, located in Joliet, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Joliet Armory was built in 1958. The facility has 47,987 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The armory is the base of operations for Detachment 1 C Company 1st Battalion 178th Infantry; and the Illinois Department of Veterans Affairs. The Joliet Armory had a firing range that was closed and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include team practices for the University of St. Francis basketball and baseball teams.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Three of the surface wipe sample results exceeded the NGB surface wipe sampling guideline for lead. A sample collected on the floor in the vault had a lead concentration of 1,445 ug/ft^2. A sample collected in the locker room, in the center of the former IFR, had a lead concentration of 212 ug/ft^2. A sample collected in the locker room, at the bullet trap area in the former IFR, had a lead concentration of 624 ug/ft^2.

The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. The Joliet Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Joliet Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Joliet Armory, located in Joliet, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 5, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Joliet Armory was built in 1958. The facility has 47,987 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The armory is the base of operations for Detachment 1 C Company 1st Battalion 178th Infantry; and the Illinois Department of Veterans Affairs. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Joliet Armory had a firing range that was closed and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include team practices for the University of St. Francis basketball and baseball teams.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Joliet Armory

V. Findings, Discussion, and Recommendations

The Joliet Armory is the base of operations for Detachment 1 C Company 1st Battalion 178th Infantry; and the Illinois Department of Veterans Affairs. The Joliet Armory had a firing range that was closed and converted to a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include team practices for the University of St. Francis basketball and baseball teams.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling guideline for lead is contained in Table 2.

Three of the surface wipe sample results exceeded the NGB guideline. Sample ILJOX21, which was collected on the floor in the vault had a lead concentration of 1,445 ug/ft^2. Sample ILJOX24, which was collected in the locker room, in the center of the former IFR, had a lead concentration of 212 ug/ft^2. Sample ILJOX25, which was collected in the locker room, at the bullet trap area in the former IFR, had a lead concentration of 624 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and

Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The Joliet Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

ANSI/IESNA RP-7-01
NGB Design Guides, 2011

Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office and storage areas.

Recommendation:

Increase the illumination levels in the areas that did not meet minimum illumination requirements. (**RAC 4**)

This survey was conducted by, and report written by Non-Responsive CIH, CPE as a representative of the NGB. This survey report was reviewed by Non-Responsive, Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Technical Assistance: For technical assistance regarding information found in this report or the performed survey please contact the Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Appendix B

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Appendix D

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Kankakee Armory, located in Kankakee, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Kankakee Armory was built in 1991, and it has 14,386 square feet of floor space. The armory is the base of operations for Company C 1st 178th Infantry Battalion and the Army Reserve Engineers 317th. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kankakee Armory had an indoor firing range that was closed in 2010 and converted to a classroom. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: use as a polling place; and meetings of the Sammons Point Village Council, about once per month.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. One of the surface wipe sample results exceeded the NGB criteria. A sample collected in room 125A, the former indoor firing range, at the bullet trap area in the corner, had a lead concentration of 25,136 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Kankakee Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Kankakee Armory, located in Kankakee, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on February 27, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Kankakee Armory was built in 1991, and it has 14,386 square feet of floor space. The armory is the base of operations for Company C 1st 178th Infantry Battalion and the Army Reserve Engineers 317th. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kankakee Armory had an indoor firing range that was closed in 2010 and converted to a classroom. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: use as a polling place; and meetings of the Sammons Point Village Council, about once per month.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Kankakee Armory

V. Findings, Discussion, and Recommendations

The Kankakee Armory is the base of operations for Company C 1st 178th Infantry Battalion and the Army Reserve Engineers 317th. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kankakee Armory had an indoor firing range that was closed in 2010. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

One of the surface wipe sample results exceeded the NGB criteria. Sample ILKAW3, which was collected in room 125A, the former indoor firing range, at the bullet trap area in the corner, had a lead concentration of 25,136 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Kankakee Armory, located in Kankakee, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Kankakee Armory was built in 1991. The facility has 14,386 square feet of floor space that encompasses an indoor firing range that has been closed, a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a concrete floor, concrete block walls that are 22 feet high and a sloped roof that is supported by exposed metal trusses. The office and classroom areas have carpeted floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer.

The Kankakee Armory is the base of operations for Charlie Company 178th Infantry, and the 317th Engineering Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kankakee Armory has an indoor firing range that has been closed. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include use as a polling place and ASVAB test site.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILKAW4 which was collected on the floor of the former indoor firing range, in front of the area where the bullet trap had been located, had a lead concentration of 1,700 ug/ft^2.

Site personnel reported that the former indoor firing range may be converted to a dining hall and classroom. The indoor firing range should be decontaminated before it is converted to other uses. Follow up surface wipe sampling for lead should be performed after the lead decontamination is completed.

The Kankakee Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Kankakee Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

Follow up surface wipe sampling for lead should be performed after the lead decontamination is completed. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. Continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.	2 2 4 4 2
Lighting		
A lighting survey was conducted in the offices and storage areas in the Kankakee Armory. Most of the areas surveyed did not meet minimum illumination requirements.	Illumination levels should be improved in some offices and storage areas.	4

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Kankakee Armory, located in Kankakee, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on June 30, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Kankakee Armory was built in 1991. The facility has 14,386 square feet of floor space that encompasses an indoor firing range that has been closed, a drill floor, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a concrete floor, concrete block walls that are 22 feet high and a sloped roof that is supported by exposed metal trusses. The office and classroom areas have carpeted floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer.

The Kankakee Armory is the base of operations for Charlie Company 178th Infantry, and the 317th Engineering Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Kankakee Armory has an indoor firing range that has been closed. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include use as a polling place and ASVAB test site.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Kankakee Armory

VI. Findings, Discussion, and Recommendations

The Kankakee Armory is the base of operations for Charlie Company 178th Infantry, and the 317th Engineering Battalion. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. The armory has an indoor firing range that has been closed. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILKAW4 which was collected on the floor of the former indoor firing range, in front of the area where the bullet trap had been located, had a lead concentration of 1,700 ug/ft^2. Site personnel reported that the

former indoor firing range may be converted to a dining hall and classroom. The indoor firing range should be decontaminated before it is converted to other uses. Follow up surface wipe sampling for lead should be performed after the lead decontamination is completed.

The Kankakee Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Area Wipe Sampling Results for Metals
Illinois Army National Guard
Kankakee Armory
Kankakee, Illinois
June 30, 2010

Analyte	ILKAW1 (ug/ft^2) Room 149 – on Conference Table	ILKAW2 (ug/ft^2) Kitchen – on Vulcan Range	ILKAW3 (ug/ft^2) Drill Floor – on Floor, Center of Room
Lead	<91	<91	<91
Cadmium	<9.1	<9.1	<9.1
Chromium	<91	<91	<91

Analyte	ILKAW 4 (ug/ft^2) IFR – on Floor at Bullet Trap	ILKAW 5 (ug/ft^2) Vault – on Floor	ILKAW 6 (ug/ft^2) Field Blank
Lead	**1700**	<91	ND
Cadmium	19	<9.1	ND
Chromium	<91	<91	ND

Note:
1) ug/ft^2= micrograms per square foot of surface area. 2) **Bold** indicates that concentration was "significant."
3) ND = None Detected

Recommendations:

1. The indoor firing range should be decontaminated before it is converted to other uses. (**RAC 2**)

2. Follow up surface wipe sampling for lead should be performed in the indoor firing range after the lead decontamination has been completed. (**RAC 2**)

3. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

4. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

5. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Kedzie Armory, located in Chicago, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Kedzie Armory was built in 1940. The facility has 204,256 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and four weapons vaults. At the time of the survey, the Kedzie Armory was undergoing major renovations to the inside and outside of the armory.

The Kedzie Armory is the base of operations for the 244th Army Liaison Team, and the HHC of the 108th Sustainment Brigade. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. Site personnel reported that the Kedzie Armory had a firing range that was closed between 8 and 10 years ago. Weapons are usually cleaned in front of the vaults.

The armory is available for rental for community activities. It was rented as a set for the movie "The Express". Community activities include JROTC drills and ceremonies twice a year and assemblies for homeless veteran about twice a year. The veterans are provided with showers, haircuts, medical exams, and Chicago Transit Authority transportation passes.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Two of the surface wipe sample results exceeded the above criteria. Sample ILKAW1 which was collected on the floor in the corner of weapons vault #2 had a lead concentration of 8,300 ug/ft^2 and a chromium concentration of 1,000 ug/ft^2. Sample ILKAW2 which was collected on the floor behind the bullet trap in the former firing range area had a lead concentration of 1,900 ug/ft^2.

The Kedzie Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Kedzie Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Kedzie Armory, located in Chicago, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on March 18, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Kedzie Armory was built in 1940. The facility has 204,256 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and four weapons vaults. The drill floor has a wood floor and ceramic covered concrete block walls. The office and classroom areas have tile or carpeted floors, ceramic covered concrete block or plaster walls, and suspended or plaster ceilings. The exterior of the building is masonry. At the time of the survey, the Kedzie Armory was undergoing major renovations to the inside and outside of the armory.

The Kedzie Armory is the base of operations for the 244th Army Liaison Team, and the HHC of the 108th Sustainment Brigade. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. Site personnel reported that the Kedzie Armory had a firing range that was closed between 8 and 10 years ago. Weapons are usually cleaned in front of the vaults.

The armory is available for rental for community activities. It was rented as a set for the movie “The Express”. Community activities include JROTC drills and ceremonies twice a year and assemblies for homeless veteran about twice a year. The veterans are provided with showers, haircuts, medical exams, and Chicago Transit Authority transportation passes.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Kedzie Armory

VI. Findings, Discussion, and Recommendations

The Kedzie Armory is the base of operations for the 244th Army Liaison Team, and the HHC of the 108th Sustainment Brigade. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. Site personnel reported that the Kedzie Armory had a firing range that was closed between 8 and 10 years ago. Weapons are usually cleaned in front of the vaults.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Two of the surface wipe sample results exceeded the above criteria. Sample ILKAW1 which was collected on the floor in the corner of weapons vault #2 had a lead concentration of 8,300 ug/ft^2 and a chromium concentration of 1,000 ug/ft^2. Sample ILKAW2 which was collected on the floor behind the bullet trap in the former firing range area had a lead concentration of 1,900 ug/ft^2.

The Kedzie Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

1) ug/ft^2= micrograms per square foot of surface area. 2) **Bold** indicates that concentration was "significant."
3) ND = None Detected

Recommendations:

1. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

2. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Kewanee Armory, located in Kewanee, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Kewanee Armory was built in 1954. The facility has about 41,213 square feet of floor space. The armory is the base of operations for the 2nd Squadron 106th Cavalry, the Department of Veteran`s Affairs, and the Recruit Command. During the week, most of the activities at the armory involve administrative work. Site personnel reported that there are no maintenance bays. The Kewanee Armory had a firing range that was closed in 2002 and converted to a classroom and weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: Blackhawk East College basketball and volleyball games; an annual high school basketball tournament; community walkers; annual health department flu shots; and a YMCA tumbling tournament every four years.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Kewanee Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Kewanee Armory. Most of the areas surveyed met the minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Kewanee Armory, located in Kewanee, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 15, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Kewanee Armory was built in 1954. The facility has about 41,213 square feet of floor space. The armory is the base of operations for the 2nd Squadron 106th Cavalry, the Department of Veteran`s Affairs, and the Recruit Command. During the week, most of the activities at the armory involve administrative work. Site personnel reported that there are no maintenance bays. The Kewanee Armory had a firing range that was closed in 2002 and converted to a classroom and weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: Blackhawk East College basketball and volleyball games; an annual high school basketball tournament; community walkers; annual health department flu shots; and a YMCA tumbling tournament every four years.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Kewanee Armory

V. Findings, Discussion, and Recommendations

The armory is the base of operations for the 2nd Squadron 106th Cavalry, the Department of Veteran`s Affairs, and the Recruit Command. Site personnel reported that there are no maintenance bays. The Kewanee Armory had a firing range that was closed in 2002 and converted to a classroom and weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Kewanee Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Lawrenceville Armory, located in Lawrenceville, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Lawrenceville Armory was built in 1936 and it has 28,808 square feet of floor space. The armory is the base of operations for the 631st Engineer Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The Lawrenceville Armory had an indoor firing range (IFR) that was closed about twenty years ago and converted into a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is used as an exercise area by senior walkers from the community.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination; a visual inspection of suspect damaged asbestos containing materials; and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Two of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected on the floor in the vault had a lead concentration of 495 ug/ft^2. A sample collected on the floor in the rear of the locker room (near the former IFR bullet trap area) had a lead concentration of 3,814 ug/ft^2. The Lawrenceville Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. The armory should clean up the areas where lead contamination has been identified. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Lawrenceville Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

Damaged suspect asbestos containing materials (ACM) were observed in the basement storage room and boiler room. The damaged suspect ACM should be sampled and identified. Damaged ACM should be repaired or replaced by a qualified asbestos abatement company.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Lawrenceville Armory, located in Lawrenceville, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 13, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Lawrenceville Armory was built in 1936 and it has 28,808 square feet of floor space. The armory is the base of operations for the 631st Engineer Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The Lawrenceville Armory had an indoor firing range (IFR) that was closed about twenty years ago and converted into a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is used as an exercise area by senior walkers from the community.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination; a visual inspection of suspect damaged asbestos containing materials; and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Lawrenceville Armory

V. Findings, Discussion, and Recommendations

The Lawrenceville Armory is the base of operations for the 631st Engineer Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. The armory had a firing range that was closed twenty years ago and converted into a locker room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Two of the surface wipe sample results exceeded the NGB criteria. Sample ILLXW11, which was collected on the floor in the vault had a lead concentration of 495 ug/ft^2. Sample ILLXW14, which was collected on the floor in the rear of the locker room (near the former IFR bullet trap area) had a lead concentration of 3,814 ug/ft^2. The Lawrenceville Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. The armory should clean up the areas where lead contamination has been

identified. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Machesney Park Armory, located in Machesney Park, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Machesney Park Armory was built in 1993, and has 53,500 square feet of floor space. The armory is the base of operations for the 135th Chemical Company, the Department of Veterans Affairs, the 33rd Brigade Special Troops Battalion, HHC 33rd Brigade Special Troops Battalion, and Charlie Company RSP. The armory may be used as a polling place. Site personnel reported that the Machesney Park Armory had an indoor firing range that was closed and converted to a supply room. Weapons are stored in three vaults, and they may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. The armory does not have a maintenance bay.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five surface wipe samples were collected on representative surfaces in the facility and analyzed for lead. None of the sample results exceeded the NGB criteria for lead. The Machesney Park Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the armory. A few of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Machesney Park Armory, located in Machesney Park, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 13, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Machesney Park Armory was built in 1993, and has 53,500 square feet of floor space. The armory is the base of operations for the 135th Chemical Company, the Department of Veterans Affairs, the 33rd Brigade Special Troops Battalion, HHC 33rd Brigade Special Troops Battalion, and Charlie Company RSP. The armory may be used as a polling place.

Site personnel reported that the Machesney Park Armory had an indoor firing range that was closed and converted to a supply room. Weapons are stored in three vaults, and they may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. The armory does not have a maintenance bay.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Machesney Park Armory

V. Findings, Discussion, and Recommendations

The Machesney Park Armory is the base of operations for the 135th Chemical Company, the Department of Veterans Affairs, the 33rd Brigade Special Troops Battalion, HHC 33rd Brigade Special Troops Battalion, and Charlie Company RSP. The armory may be used as a polling place.

Site personnel reported that the Machesney Park Armory had an indoor firing range that was closed and converted to a supply room. Weapons are stored in three vaults, and they may be cleaned in the vaults, in the supply room, or on tables set up on the drill floor. The armory does not have a maintenance bay.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. All of the sample results were below the limit of detection for lead. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

The Machesney Park Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue

to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Macomb Armory, located in Macomb, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Macomb Armory was built in 1954. The armory is the base of operations for Battery B 2nd Battalion 123rd Field Artillery, and HQ 44th Chemical Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory's maintenance bay may be used by FMS 21 mechanics to supplement their three bay shop. No vehicle maintenance was performed on the day of the survey. The Macomb Armory does not have a firing range. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include: grade school basketball games; a family readiness group; cookouts; and a Christmas party for children.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. One of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected on a workbench in the maintenance bay had a lead concentration of 550 ug/ft^2. The Macomb Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Macomb Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some support, maintenance bay, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Macomb Armory, located in Macomb, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 5, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Macomb Armory was built in 1954. The armory is the base of operations for Battery B 2nd Battalion 123rd Field Artillery, and HQ 44th Chemical Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory's maintenance bay may be used by FMS 21 mechanics to supplement their three bay shop. No vehicle maintenance was performed on the day of the survey. The Macomb Armory does not have a firing range. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: grade school basketball games; a family readiness group; cookouts; and a Christmas party for children.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Macomb Armory

V. Findings, Discussion, and Recommendations

The Macomb Armory is the base of operations for Battery B 2nd Battalion 123rd Field Artillery, and HQ 44th Chemical Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory's maintenance bay may be used by FMS 21 mechanics to supplement their three bay shop. No vehicle maintenance was performed on the day of the survey. The Macomb Armory does not have a firing range. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

One of the surface wipe sample results exceeded the NGB criteria. Sample ILMBARW4, which was collected on a workbench in the maintenance bay had a lead concentration of 550 ug/ft^2. The Macomb Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention

should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Macomb Armory, located in Macomb, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Macomb Armory was built in 1954 and renovated in 2009. The facility has about 43,634 square feet of floor space that encompasses a distance learning lab, drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The armory is the base of operations for HHD 44th Chemical Battalion, Bravo Battery 2-123rd Field Artillery, Veterans Administration representatives, and family services personnel. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey.

The Macomb Armory had a firing range that is now closed. The firing range area was decontaminated and converted into a chow hall. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for community activities that may include funerals and wakes for servicemen. On the day of the survey, a day care group was visiting the armory.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). All of the sample results were below the limit of detection for the metals. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Macomb Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Macomb Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Macomb Armory, located in Macomb, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on July 1, 2100.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Macomb Armory was built in 1954 and renovated in 2009. The facility has about 43,634 square feet of floor space that encompasses a distance learning lab, drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The drill floor has a wood floor, concrete block walls that are twenty feet high and a gabled roof that is supported by exposed metal beams. The office and classroom areas have tile or carpet floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer.

The Macomb Armory is the base of operations for HHD 44th Chemical Battalion, Bravo Battery 2-123rd Field Artillery, Veterans Administration representatives, and family services personnel. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey.

The Macomb Armory had a firing range that is now closed. The firing range area was decontaminated and converted into a chow hall. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that may include funerals and wakes for servicemen. On the day of the survey, a day care group was visiting the armory.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Macomb Armory

VI. Findings, Discussion, and Recommendations

The Macomb Armory is the base of operations for HHD 44th Chemical Battalion, Bravo Battery 2-123rd Field Artillery, Veterans Administration representatives, and family services personnel. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. The armory had a firing range that is now closed. The firing range area was decontaminated and converted into a chow hall. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). All of the sample results were below the limit of detection for the metals. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Macomb

Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Recommendations:

1. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

2. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Marion Armory, located in Marion, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Marion Armory was built in 1992. The facility has 38,304 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The Marion Armory is the base of operations for the 2nd Battalion 130th Infantry and RSP Team 12. During the week, most of the activities at the armory involve administrative work. No major vehicle maintenance is performed at the armory.

The Marion Armory had an indoor firing range that was closed and converted to a supply room. This supply room and both of the weapons vaults were locked and were not accessible on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include state police training in classrooms and dog obedience classes.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). All of the sample results were below the limit of detection for the metals. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Marion Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Marion Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Marion Armory, located in Marion, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 3, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Marion Armory was built in 1992. The facility has 38,304 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, latrines, supply room and two weapons vaults. The drill floor has a concrete floor, concrete block walls that are twenty two feet high and a sloped roof that is supported by exposed metal trusses. The office and classroom areas have carpet or tile floors, drywall walls and suspended ceilings. The exterior of the building is brick veneer.

The Marion Armory is the base of operations for the 2nd Battalion 130th Infantry and RSP Team 12. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. Site personnel also reported that the Marion Armory had an indoor firing range that was closed and converted to a supply room. This supply room and both of the weapons vaults were locked and were not accessible on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include state police training in classrooms and dog obedience classes.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Marion Armory

VI. Findings, Discussion, and Recommendations

The Marion Armory is the base of operations for the 2nd Battalion 130th Infantry and RSP Team 12. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. The Marion Armory had an indoor firing range that was closed and converted to a supply room. This supply room and both of the weapons vaults were locked and were not accessible on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). All of the sample results were below the limit of detection for the metals. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. None of the surface wipe sample results exceeded the above criteria. The Marion Armory should continue to prohibit the presence of food and drink in work areas, stress the

importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Marion Armory, located in Marion, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Marion Armory was built in 1993, and it has about 38,304 square feet of floor space. The armory is the base of operations for the 2nd Battalion 130th Infantry Regiment and N Company RSP. During the week, most of the activities at the armory involve administrative work. The Marion Armory had a firing range that has been closed and converted for use for electronic skills training. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include: Red Cross blood drives; Unit Christmas parties; dog obedience courses; and Civil Air Patrol meetings.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Marion Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Marion Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Marion Armory, located in Marion, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 12, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Marion Armory was built in 1993, and it has about 38,304 square feet of floor space. The armory is the base of operations for the 2nd Battalion 130th Infantry Regiment and N Company RSP. During the week, most of the activities at the armory involve administrative work. The Marion Armory had a firing range that has been closed and converted for use for electronic skills training (Engagement Skills Training Room 155B). Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: Red Cross blood drives; Unit Christmas parties; dog obedience courses; and Civil Air Patrol meetings.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Marion Armory

V. Findings, Discussion, and Recommendations

The Marion Armory is the base of operations for the 2nd Battalion 130th Infantry Regiment and N Company RSP. During the week, most of the activities at the armory involve administrative work. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include: Red Cross blood drives; Unit Christmas parties; dog obedience courses; and Civil Air Patrol meetings.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Marion Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Marseilles Armory, located in Marseilles, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Marseilles Armory was built in 1986. The facility has 23,000 square feet of floor space. The armory is the base of operations for the A Company 33rd BSTB Engineers, G Company RSP Gladiators, and the area facilities maintenance team. During the week, most of the activities at the armory involve administrative work. The Marseilles Armory had an indoor firing range that was closed in 1987. Site personnel reported that the armory is not used for community activities.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Marseilles Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Marseilles Armory. Most of the areas surveyed met minimum illumination requirements. Illumination levels should be improved in some support and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Marseilles Armory, located in Marseilles, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 20, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Marseilles Armory was built in 1986. The facility has 23,000 square feet of floor space. The armory is the base of operations for the A Company 33rd BSTB Engineers, G Company RSP Gladiators, and the area facilities maintenance team. During the week, most of the activities at the armory involve administrative work. Site personnel reported that there are no maintenance bays and that no vehicle maintenance is performed at the armory.

The Marseilles Armory had an indoor firing range that was closed in 1987. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not used for community activities.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Marseilles Armory

V. Findings, Discussion, and Recommendations

The armory is the base of operations for the A Company 33rd BSTB Engineers, G Company RSP Gladiators, and the area facilities maintenance team. During the week, most of the activities at the armory involve administrative work. Site personnel reported that there are no maintenance bays and that no vehicle maintenance is performed at the armory.

The Marseilles Armory had an indoor firing range that was closed in 1987. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory is not used for community activities.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Marseilles Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal

surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

At

Illinois Army National Guard
North Riverside Armory
8660 West Cermak Road

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, North Riverside Armory, located in North Riverside, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for HQ 108th MMB; HHD 108th MMB; 3625th MT Company; 1244th Transportation Company; 405th BSB, and the 406th Signal Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory.

The North Riverside Armory had an indoor firing range that was closed and converted to a weight room and computer learning lab. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include: the Lincoln Challenge for at risk teens; family readiness functions; and job fairs.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. One of the surface wipe sample results exceeded the NGB guideline for lead. A sample collected on the floor in vault 2 had a lead concentration of 357 ug/ft^2. The North Riverside Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the North Riverside Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, North Riverside Armory, located in North Riverside, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 5, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for HQ 108th MMB; HHD 108th MMB; 3625th MT Company; 1244th Transportation Company; 405th BSB, and the 406th Signal Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The North Riverside Armory had an indoor firing range that was closed and converted to a weight room and computer learning lab. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: the Lincoln Challenge for at risk teens; family readiness functions; and job fairs.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – North Riverside Armory

V. Findings, Discussion, and Recommendations

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The North Riverside Armory had an indoor firing range that was closed and converted to a weight room and computer learning lab. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include: the Lincoln Challenge for at risk teens; family readiness functions; and job fairs.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling guideline for lead is contained in Table 2.

One of the surface wipe sample results exceeded the NGB guideline. Sample ILNRW21, which was collected on the floor in vault 2 had a lead concentration of 357 ug/ft^2. The North Riverside Armory should continue to prohibit the presence of food and drink in work areas, stress the

importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Appendix B

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, North Riverside Armory, located in North Riverside, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. Weapons may be cleaned in the arms vaults, in the supply room, or on tables set up on the drill floor.

The North Riverside Armory had an indoor firing range (IFR) that was closed in 1991. On the day of the survey, a lead abatement project was being performed in the former IFR in order to convert it into a computer lab and workout room.

The armory is available for rental for community activities that may include: the Lincoln challenge for 13-17 year olds; armed forces qualification testing on computers; and a polling place for voting.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. At present, there are no regulated or recommended levels for surface levels of lead in military facilities. There are no OSHA regulated levels for lead on surfaces. For the purposes of this report, any lead level that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILNRA1, which was collected on a workbench in the vault (room 132) had a lead concentration of 455 ug/ft^2.

The North Riverside Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the North Riverside Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, North Riverside Armory, located in North Riverside, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 15, 2011.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. Weapons may be cleaned in the arms vaults, in the supply room, or on tables set up on the drill floor.

The North Riverside Armory had an indoor firing range (IFR) that was closed in 1991. On the day of the survey, a lead abatement project was being performed in the former IFR in order to convert it into a computer lab and workout room.

The armory is available for rental for community activities that may include: the Lincoln challenge for 13-17 year olds; armed forces qualification testing on computers; and a polling place for voting.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – North Riverside Armory

V. Findings, Discussion, and Recommendations

The North Riverside Armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. Weapons may be cleaned in the arms vaults, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. At present, there are no regulated or recommended levels for surface levels of lead in military facilities. There are no OSHA regulated levels for lead on surfaces. For the purposes of this report, any lead level that exceeds 200 ug/ft^2 is considered significant. One of the surface wipe sample results exceeded the above criteria. Sample ILNRA1, which was collected on a workbench in the vault (room 132) had a lead concentration of 455 ug/ft^2.

The North Riverside Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue

to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, North Riverside Armory Indoor Firing Range located in North Riverside, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. Weapons may be cleaned in the arms vaults, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include: the Lincoln challenge for 13-17 year olds; armed forces qualification testing on computers; and a polling place for voting.

The North Riverside Armory had an indoor firing range (IFR) that was closed in 1991. On the day of the survey, a lead abatement project was being performed in the former IFR in order to convert it into a computer lab and workout room. Site personnel requested an assessment of the effectiveness of the control measures established by the lead abatement contractor to keep lead dust within the abatement area. The lead abatement contractor had established a negative pressure enclosure for the abatement area, a shower and change room for leaving the abatement area, and a separate clean room to change into clean clothing. Entrance to the clean room was controlled by walls that had been built by the contractor. Unauthorized personnel were prohibited from entering the abatement or shower and change rooms. The sampling strategy was designed to determine the effectiveness of the controls established by the abatement contractor to ensure that lead dust did not leave the abatement and clean room area that was under the control of the contractor. Surface wipe samples were collected outside of the clean room area to determine the effectiveness of the lead abatement controls.

Five samples were collected on representative surfaces near the IFR abatement area and analyzed for lead. The results indicated detectable levels of lead at both exits from the clean room and just outside of the lead hazard barrier wall. Lead results were below the limit of detection in the center of the drill floor and on a treadmill located on the drill floor. The results suggest that lead dust was migrating from the abatement area to the drill floor.

The North Riverside Armory should ensure that the lead abatement contractor controls the potential spread of lead from the abatement area. All detectable lead on the drill floor should be cleaned up by the abatement contractor at the conclusion of the IFR lead abatement project.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, North Riverside Armory Indoor Firing Range, located in North Riverside, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous lead levels occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 15, 2011.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The North Riverside Armory was built in 1988 and has about 79,753 square feet of floor space. The armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no vehicle maintenance activities are performed at the armory. Weapons may be cleaned in the arms vaults, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that may include: the Lincoln challenge for 13-17 year olds; armed forces qualification testing on computers; and a polling place for voting.

The North Riverside Armory had an indoor firing range (IFR) that was closed in 1991. On the day of the survey, a lead abatement project was being performed in the former IFR in order to convert it into a computer lab and workout room. Site personnel requested an assessment of the effectiveness of the control measures established by the lead abatement contractor to keep lead dust within the abatement area. The lead abatement contractor had established a negative pressure enclosure for the abatement area, a shower and change room for leaving the abatement area, and a separate clean room to change into clean clothing. Entrance to the clean room was controlled by walls that had been built by the contractor. Unauthorized personnel were prohibited from entering the abatement or shower and change rooms. The sampling strategy was designed to determine the effectiveness of the controls established by the abatement contractor to ensure that lead dust did not leave the abatement and clean room area that was under the control of the contractor. Surface wipe samples were collected outside of the clean room area to determine the effectiveness of the lead abatement controls.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for lead contamination. Photographs were taken, as appropriate.

Figure 1 – North Riverside Armory

VI. Findings, Discussion, and Recommendations

The North Riverside Armory is the base of operations for the 108th Medical Battalion, 708th Ground Ambulance, 710th Area Support Medical Company, 1244th Transportation Company, 405th BSB, 406th Signal Company, 3625th Maintenance Company and the Recruit Sustainment Program.

The North Riverside Armory had an indoor firing range (IFR) that was closed in 1991. On the day of the survey, a lead abatement project was being performed in the former IFR in order to convert it into a computer lab and workout room. Site personnel requested an assessment of the effectiveness of the control measures established by the lead abatement contractor. The lead abatement contractor has established a negative pressure enclosure for the abatement process, a shower and change room for leaving the abatement area, and a separate clean room to change into clean clothing (Figures 2-4). Unauthorized personnel were prohibited from entering the

abatement or shower and change rooms. The sampling strategy was designed to determine the effectiveness of the controls established by the abatement contractor. Surface wipe samples were collected outside of the clean room to determine the effectiveness of the lead abatement controls.

Figure 2 – North Riverside Armory IFR Abatement – Clean Room

Figure 3 – North Riverside Armory IFR Abatement Controlled Access to Clean Room

Figure 4 – North Riverside Armory IFR Abatement Poster on Access Door to Clean Room

Surface Wipe Samples

Five samples were collected on representative surfaces near the IFR abatement area and analyzed for lead. The results are contained in Table 1. Wipe sample locations are contained in Figure 5.

The results indicated detectable levels of lead at both exits from the clean room and just outside of the lead hazard barrier wall. Lead results were below the limit of detection in the center of the drill floor and on a treadmill located on the drill floor. The results suggest that lead dust was migrating from the abatement area to the drill floor.

The North Riverside Armory should ensure that the lead abatement contractor controls the potential spread of lead from the abatement area. All detectable lead on the drill floor should be cleaned up by the abatement contractor at the conclusion of the IFR lead abatement project.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Pontiac Armory, located in Pontiac, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Pontiac Armory was built in 1938, and it has 32,825 square feet of floor space. The armory is the base of operations for Troop A, 2-106th Cavalry Squadron. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Pontiac Armory had an indoor firing range that was closed approximately thirty years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: high school wrestling practice; the Livingston County Health Department Health Fair; the Livingston County Career Center Career Fair; and Red Cross Blood Drives.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Three of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected in the basement in the former indoor firing range, in the bullet trap area, had a lead concentration of 959 ug/ft^2. A sample collected in the basement, in the center of the former indoor firing range, had a lead concentration of 1,709 ug/ft^2. A sample collected on the floor in the vault had a lead concentration of 759 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The Pontiac Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Pontiac Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Pontiac Armory, located in Pontiac, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on February 28, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Pontiac Armory was built in 1938, and it has 32,825 square feet of floor space. The armory is the base of operations for Troop A, 2-106th Cavalry Squadron. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Pontiac Armory had an indoor firing range that was closed approximately thirty years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: high school wrestling practice; the Livingston County Health Department Health Fair; the Livingston County Career Center Career Fair; and Red Cross Blood Drives.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Pontiac Armory

V. Findings, Discussion, and Recommendations

The Pontiac Armory is the base of operations for Troop A, 2-106th Cavalry Squadron. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Pontiac Armory had an indoor firing range that was closed approximately thirty years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Three of the surface wipe sample results exceeded the NGB criteria. Sample ILPOW1, which was collected in the basement in the former indoor firing range, in the bullet trap area, had a lead concentration of 959 ug/ft^2. Sample ILPOW2, which was collected in the basement, in the center of the former indoor firing range, had a lead concentration of 1,709 ug/ft^2. Sample ILPOW3, which was collected in the vault on the floor had a lead concentration of 759 ug/ft^2. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM

420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2.

The Pontiac Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Table 2
NGB Surface Wipe Sampling Criteria for Lead

Metal	Acceptable Surface Level ug/ft^2	Basis for Criteria
Lead	200	NG Pam 420-15

Recommendations:

1. The closed indoor firing range should be cleaned up as specified by the procedures contained in NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges. Residual lead contamination of surfaces must be less than 200 ug/ft^2. (**RAC 2**)

2. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

3. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

4. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Quincy Armory, located in Quincy, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Quincy Armory was built in 1977. The facility has about 28,860 square feet of floor space. The armory is the base of operations for the 1844th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory had an indoor firing range that was closed in the 1990's and converted into a classroom. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory does not have a vehicle maintenance bay. Site personnel reported that the armory is not available for rental for community activities.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Quincy Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Quincy Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Quincy Armory, located in Quincy, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 6, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Quincy Armory was built in 1977. The facility has about 28,860 square feet of floor space. The armory is the base of operations for the 1844th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory had an indoor firing range that was closed in the 1990's and converted into a classroom. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory does not have a vehicle maintenance bay. Site personnel reported that the armory is not available for rental for community activities.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Quincy Armory

V. Findings, Discussion, and Recommendations

The Quincy Armory is the base of operations for the 1844th Transportation Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that the armory had an indoor firing range that was closed in the 1990's and converted into a classroom. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory does not have a vehicle maintenance bay. Site personnel reported that the armory is not available for rental for community activities.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Quincy Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Rock Falls Armory, located in Rock Falls, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Rock Falls Armory was built in 1956, and it has about 32,400 square feet of floor space. The armory is the base of operations for the 164th Transportation Hotel Company RSP and the Department of Veterans Affairs. During the week, most of the activities at the armory involve administrative work. Site personnel reported that there are no maintenance bays. The Rock Falls Armory had a firing range that was closed in 2004 and converted to a classroom, weight room and janitors room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include: high school basketball; and park district exercise programs for adults.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB surface wipe sampling criteria criteria for lead. The Rock Falls Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Rock Falls Armory. Most of the areas surveyed met minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Rock Falls Armory, located in Rock Falls, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 14, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Rock Falls Armory

V. Findings, Discussion, and Recommendations

The Rock Falls Armory is the base of operations for the 164th Transportation Hotel Company RSP and the Department of Veterans Affairs. Site personnel reported that there are no maintenance bays. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB surface wipe sampling criteria criteria for lead. The Rock Falls Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Salem Armory, located in Salem, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Salem Armory was built in 1938 and has 31,689 square feet of floor space. The Salem Armory had a firing range that closed in 1998. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include a volleyball league and senior citizens who walk the perimeter of the drill floor for exercise.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Ten samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Six of the surface wipe sample results exceeded the above criteria. Sample ILSLW3 which was collected on the drill floor, in the northeast corner on a windowsill ten feet above the floor, had a lead concentration of 1,500 ug/ft^2. Sample ILSLW4 which was collected on the drill floor, in the southeast corner on a windowsill ten feet above the floor, had a lead concentration of 1,100 ug/ft^2. Sample ILSLW6 which was collected on the floor of the vault had a lead concentration of 290 ug/ft^2. Sample ILSLW8 which was collected in the closed indoor firing range, on the floor at the bullet trap area, had a lead concentration of 3,300 ug/ft^2. Sample ILSLW9 which was collected in the closed indoor firing range, on the floor of the pipe tunnel, had a lead concentration of 1,700 ug/ft^2. Sample ILSLW10 which was collected in the closed indoor firing range, on the floor near the entrance, had a lead concentration of 300 ug/ft^2. The Salem Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Salem Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

Extensive water damage was observed on the wall in the drill floor area. Several damaged wall panels had been removed. The source of the water leak should be identified and repaired.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Salem Armory, located in Salem, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 4, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Salem Armory was built in 1938. The facility has 31,689 square feet of floor space that encompasses a drill floor, garage, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, poured concrete walls that are about twenty one feet high and a poured concrete sloped roof. The office and classroom areas have tile floors, poured concrete walls and suspended ceilings. The exterior of the building is poured concrete.

The Salem Armory is the base of operations for Company D 2130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Salem Armory had a firing range that closed in 1998. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include a volleyball league and senior citizens who walk the perimeter of the drill floor for exercise.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Salem Armory

VI. Findings, Discussion, and Recommendations

The Salem Armory is the base of operations for Company D 2130th Infantry. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Ten samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Six of the surface wipe sample results exceeded the above criteria. Sample ILSLW3 which was collected on the drill floor, in the northeast corner on a windowsill ten feet above the floor, had a lead concentration of 1,500 ug/ft^2. Sample ILSLW4 which was collected on the drill

floor, in the southeast corner on a windowsill ten feet above the floor, had a lead concentration of 1,100 ug/ft^2. Sample ILSLW6 which was collected on the floor of the vault had a lead concentration of 290 ug/ft^2. Sample ILSLW8 which was collected in the closed indoor firing range, on the floor at the bullet trap area, had a lead concentration of 3,300 ug/ft^2. Sample ILSLW9 which was collected in the closed indoor firing range, on the floor of the pipe tunnel, had a lead concentration of 1,700 ug/ft^2. Sample ILSLW10 which was collected in the closed indoor firing range, on the floor near the entrance, had a lead concentration of 300 ug/ft^2.

The Salem Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 144 inches squared (in^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

At

Illinois Army National Guard
Sparta Armory
1803 Hillcrest
Sparta, Illinois

Survey date: December 11, 2012

Performed by

Department of the Army
National Guard Bureau
Region West Industrial Hygiene Office

C. Laboratory Result Reports and Chain of Custody Sheets.

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Sparta Armory, located in Sparta, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Sparta Armory is the base of operations for the 661st Engineering Company. Site personnel reported that the FMS 8 shop in Carbondale, Illinois had been closed and relocated. FMS 8 is now temporarily housed in the two maintenance bays located in the Sparta Armory. An industrial hygiene survey was performed in FMS 8 and the results of that survey and personal exposure monitoring are included in a separate report. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Armory personnel reported that the facility is not available for rental for community activities.

Site personnel reported that the Sparta Armory had an indoor firing range (IFR) that was closed and converted to a storage area. On the day of the survey, site personnel could not provide access to the former IFR. Surface wipe sampling for heavy metals should be performed in the former firing range.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metals and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead, cadmium, and chromium. None of the surface wipe sample results exceeded the NGB criteria for lead. The Sparta Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Sparta Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Sparta Armory, located in Sparta, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 11, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Sparta Armory was built in 1990 and has about 25,047 square feet of floor space. The armory is the base of operations for the 661st Engineering Company. Site personnel reported that the FMS 8 shop in Carbondale, Illinois had been closed and relocated. FMS 8 is now temporarily housed in the two maintenance bays located in the Sparta Armory. An industrial hygiene survey was performed in FMS 8 and the results of that survey and personal exposure monitoring are included in a separate report.

Site personnel reported that the Sparta Armory had an indoor firing range (IFR) that was closed and converted to a storage area. On the day of the survey, site personnel could not provide access to the former IFR. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Armory personnel reported that the facility is not available for rental for community activities.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Sparta Armory

V. Findings, Discussion, and Recommendations

The Sparta Armory is the base of operations for the 661st Engineering Company. Site personnel reported that the FMS 8 shop in Carbondale had been closed and relocated. FMS 8 is now temporarily housed in the two maintenance bays located in the Sparta Armory.

Site personnel reported that the Sparta Armory had an indoor firing range (IFR) that was closed and converted to a storage area. On the day of the survey, site personnel could not provide access to the former IFR. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Armory personnel reported that the facility is not available for rental for community activities.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead, cadmium, and chromium. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for metals are contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Sparta Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand

washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

On the day of the survey, site personnel could not provide access to the former IFR. Surface wipe sampling for heavy metals should be performed in the former firing range.

Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

Recommendation:

Increase the illumination levels in the areas that did not meet minimum illumination requirements. (**RAC 4**)

This survey was conducted by, and report written by Non-Responsive, CIH, CPE as a representative of the NGB. This survey report was reviewed by Non-Responsive, Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Technical Assistance: For technical assistance regarding information found in this report or the performed survey please contact the Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

ANALYTICAL REPORT

Submitted To: USPHS / Federal Occupational Health
Denver Federal Center
Denver, CO 80225

Attention: Non-Responsive

Submitted By:

Reference Data: Lead, Cadmium and Chromium
Sampling Site: NGB: Sparta, IL (Sparta Armory)
Sample Media: Ghost Wipe(s)®
Method Reference: OSHA ID-121
Project ID: Project 10839
DFOH Lab Nos.: TM-13-58783 through TM-13-58788
Date Received: 12/13/12
Data Analyzed: 12/17/12 – 12/18/12
Date Issued: 12/20/12

The wipe samples were hot plate digested. The samples were run on a Perkin Elmer 200 flame atomic absorption spectrophotometer (AA).

General Lab Comments:
All quality control criteria have been met.
* All samples received in condition acceptable for analysis unless otherwise noted.
** Sample results have not been corrected for contamination based on the field blank or other analytical blank unless otherwise noted.

Analytical results are given on the enclosed tables. Results relate only to items tested. If you have any questions about these results, feel free to phone the Laboratory at (312) 886-0413.

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Streator Armory, located in Streator, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Streator Armory was built in 1939, and it has about 29,828 square feet of floor space. The armory is the base of operations for Alpha Company 405th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Streator Armory had an indoor firing range that was closed in 2001. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for community activities that include: senior walking on the drill floor; Boy Scout meetings; Cub Scout meetings; banquets; and after school sports for high school students.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Streator Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Streator Armory. Some of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Streator Armory, located in Streator, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on February 28, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Streator Armory was built in 1939, and it has about 29,828 square feet of floor space. The armory is the base of operations for Alpha Company 405th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Streator Armory had an indoor firing range that was closed in 2001. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Site personnel reported that that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Streator Armory had an indoor firing range that was closed in 2001. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for community activities that include: senior walking on the drill floor; Boy Scout meetings; Cub Scout meetings; banquets; and after school sports for high school students.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Streator Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in

work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Sullivan Armory, located in Sullivan, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Sullivan Armory was built in 1953. The facility has 31,374 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and a weapons vault. The drill floor has a wood floor, concrete block walls that are about 22 feet high and an arched roof that is supported by exposed metal trusses. The office and classroom areas have carpeted or tile floors, concrete block walls and poured concrete ceilings. The exterior of the building is brick veneer.

The Sullivan Armory is the base of operations for Detachment 1, Company A, 634th Brigade Support Battalion and Headquarters, Headquarters Company, 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sullivan Armory has an indoor firing range (IFR) that closed about 10 years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory has not been available for rental for community activities in the last 3 years.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant.

Four of the surface wipe samples exceeded the above criteria for lead. Sample ILSUW2, which was collected on the floor of the IFR, near the firing area, had a lead concentration of 5,100 ug/ft^2. Sample ILSUW3, which was collected on the IFR bullet trap, had a lead concentration of 25,000 ug/ft^2. Sample ILSUW4, which was collected on the floor of the IFR, near the bullet trap, had a lead concentration of 25,000 ug/ft^2 . Sample ILSUW5, which was collected on the floor of the vault, had a lead concentration of 890 ug/ft^2.

The Sullivan Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to

clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. The indoor firing range should be decontaminated before it is converted to any other uses.

A lighting survey was conducted in the offices and storage areas in the Sullivan Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Sullivan Armory, located in Sullivan, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on July 1, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Sullivan Armory was built in 1953. The facility has 31,374 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and a weapons vault. The drill floor has a wood floor, concrete block walls that are about 22 feet high and an arched roof that is supported by exposed metal trusses. The office and classroom areas have carpeted or tile floors, concrete block walls and poured concrete ceilings. The exterior of the building is brick veneer.

The Sullivan Armory is the base of operations for Detachment 1, Company A, 634th Brigade Support Battalion and Headquarters, Headquarters Company, 634th Brigade Support Battalion. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sullivan Armory has an indoor firing range (IFR) that closed about 10 years ago. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory has not been available for rental for community activities in the last 3 years.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Sullivan Armory

VI. Findings, Discussion, and Recommendations

The Sullivan Armory is the base of operations for Detachment 1, Company A, 634th Brigade Support Battalion and Headquarters, Headquarters Company, 634th Brigade Support Battalion. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). The results are contained in Table 1. At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant.

Four of the surface wipe samples exceeded the above criteria for lead. Sample ILSUW2, which was collected on the floor of the IFR, near the firing area, had a lead concentration of 5,100 ug/ft^2. Sample ILSUW3, which was collected on the IFR bullet trap, had a lead concentration of 25,000 ug/ft^2. Sample ILSUW4, which was collected on the floor of the IFR, near the bullet trap, had a lead concentration of 25,000 ug/ft^2 . Sample ILSUW5, which was collected on the floor of the vault, had a lead concentration of 890 ug/ft^2.

The Sullivan Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special

attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. The indoor firing range should be decontaminated before it is converted to any other uses.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Sycamore Armory, located in Sycamore, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Sycamore Armory was built in 1938 and it has about 28,785 square feet of floor space. The armory is the base of operations for Battery A, 2-122nd Field Artillery. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sycamore Armory had an indoor firing range. Site personnel reported that it was closed in 1988 and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: senior walkers; decorating homecoming floats; and headquarters for a 10K race.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. None of the surface wipe sample results exceeded the NGB criteria for lead. The Sycamore Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Sycamore Armory. Most of the areas surveyed met minimum illumination requirements. Illumination levels should be improved in some storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Sycamore Armory, located in Sycamore, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on March 8, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Sycamore Armory was built in 1938 and it has about 28,785 square feet of floor space. The armory is the base of operations for Battery A, 2-122nd Field Artillery. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sycamore Armory had an indoor firing range. Site personnel reported that it was closed in 1988 and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

The armory is available for rental for community activities that include: senior walkers; decorating homecoming floats; and headquarters for a 10K race.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Sycamore Armory

V. Findings, Discussion, and Recommendations

The Sycamore Armory is the base of operations for Battery A, 2-122nd Field Artillery. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Sycamore Armory had an indoor firing range. Site personnel reported that it was closed in 1988 and converted to a storage area. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include: senior walkers; decorating homecoming floats; and headquarters for a 10K race.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

None of the surface wipe sample results exceeded the NGB criteria. The Sycamore Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, Waukegan Armory, located in Waukegan, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Waukegan Armory was built in 1938. The facility has 39,852 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault.

The Waukegan Armory is the base of operations for 933rd MP Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Waukegan Armory had a firing range. Site personnel reported that it has been closed for at least 3 years. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is not available for rental for community activities.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Two of the surface wipe sample results exceeded the above criteria. Sample ILWAW2 which was collected on the floor near the former bullet trap area in the closed firing range had a lead concentration of 49,000 ug/ft^2. Sample ILWAW4 which was collected on a storage shelf in the garage had a lead concentration of 4,700 ug/ft^2 and a chromium concentration of 490 ug/ft^2. The Waukegan Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Waukegan Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, maintenance bay, and storage areas.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, Waukegan Armory, located in Waukegan, Illinois. This work was conducted under the Interagency Agreement between The U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on April 8, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The Waukegan Armory was built in 1938. The facility has 39,852 square feet of floor space that encompasses a drill floor, maintenance bay, offices, classrooms, kitchen, latrines, supply room and weapons vault. The drill floor has a wood floor, poured concrete walls that are about 35 feet high and poured concrete block arches supporting an arched roof. The office and classroom areas have tile floors, poured concrete or concrete block walls and suspended ceilings. The exterior of the building is brick.

The Waukegan Armory is the base of operations for 933rd MP Company. During the week, most of the activities at the armory involve administrative work. Site personnel reported that vehicle maintenance activities are mostly limited to fluid checks and tire changes on drill weekends, and that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Waukegan Armory had a firing range that was located in the basement. Site personnel reported that it has been closed for at least 3 years. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is not available for rental for community activities.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – Waukegan Armory

VI. Findings, Discussion, and Recommendations

The Waukegan Armory is the base of operations for 933rd MP Company. Site personnel reported that vehicle maintenance activities are limited to fluid checks and tire changes on drill weekends. No vehicle maintenance was performed on the day of the survey. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Two of the surface wipe sample results exceeded the above criteria. Sample ILWAW2 which was collected on the floor near the former bullet trap area in the closed firing range had a lead concentration of 49,000 ug/ft^2. Sample ILWAW4 which was collected on a storage shelf in the garage had a lead concentration of 4,700 ug/ft^2 and a chromium concentration of 490 ug/ft^2. The Waukegan Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Table 1
Area Wipe Sampling Results for Metals
Illinois Army National Guard
Waukegan Armory
Waukegan, Illinois
April 8, 2010

Analyte	ILWAW1 (ug/ft^2) Drill Floor – Center of Floor	ILWAW2 (ug/ft^2) Closed Firing Range – on Floor – Near Bullet Trap	ILWAW3 (ug/ft^2) Kitchen – on Countertop
Lead	<91	**49,000**	<91
Cadmium	<9.1	<9.1	<9.1
Chromium	<91	<91	<91

Analyte	ILWAW4 (ug/ft^2) Garage – on Storage Shelf	ILWAW5 (ug/ft^2) Vault – on Storage Rack	ILWAW6 (ug/ft^2) Field Blank
Lead	**4,700**	<91	ND
Cadmium	35	24	ND
Chromium	**490**	<91	ND

Note:
1) ug/ft^2= micrograms per square foot of surface area.
2) **Bold** indicates that concentration was "significant."
3) ND = None Detected

Recommendations:

1. Continue to prohibit the presence of food and drink in work areas and stress the importance of hand washing prior to the consumption of food items. (**RAC 4**)

2. Continue to clean the horizontal surfaces in work and storage areas. (**RAC 4**)

3. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition. (**RAC 2**)

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated by the manufacturer. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

D. Occupational Health Risk Assessment Codes (RACs)

I. Executive Summary

At the request of the National Guard Bureau Region West Industrial Hygiene Office, field personnel representing the U.S. Public Health Service, Division of Federal Occupational Health (FOH) conducted an industrial hygiene survey at the Illinois Army National Guard, West Frankfort Armory, located in West Frankfort, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The West Frankfort Armory was built in 1958. The facility has 20,379 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, and latrines. On the day of the survey, a 30' by 40' addition for a weapons vault and storage areas was under construction to expand the armory.

The West Frankfort Armory is the base of operations for Alpha Company 130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. The West Frankfort Armory had an indoor firing range in the basement that was closed prior to 2001. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include book sales.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Three of the surface wipe sample results exceeded the above criteria. Sample ILWFW1 which was collected in the basement, on the floor in the former bullet trap area, had a lead concentration of 520 ug/ft^2 and a chromium concentration of 300 ug/ft^2. Sample ILWFW2 which was collected in the basement, on the floor in the center of the room, had a lead concentration of 300 ug/ft^2. Sample ILWFW3 which was collected in the basement, on the floor near the entrance, had a lead concentration of 350 ug/ft^2. The West Frankfort Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the West Frankfort Armory. Most of the areas surveyed did not meet minimum illumination requirements.

III. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the USPHS, FOH at the Illinois Army National Guard, West Frankfort Armory, located in West Frankfort, Illinois. This work was conducted under the Interagency Agreement between the U.S. Public Health Service (USPHS) Federal Occupational Health (FOH) and the West Region of the Army National Guard. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on November 4, 2010.

FOH conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

IV. Site Description

The West Frankfort Armory was built in 1958. The facility has 20,379 square feet of floor space that encompasses a drill floor, offices, classrooms, kitchen, and latrines. The drill floor has a concrete floor, concrete block walls that are about twenty six feet high and a sloped roof that is supported by exposed metal trusses. The office and classroom areas have tile floors, concrete block walls and suspended ceilings. The exterior of the building is brick veneer. On the day of the survey, a 30’ by 40’ addition for a weapons vault and storage areas was under construction to expand the armory.

The West Frankfort Armory is the base of operations for Alpha Company 130th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. The West Frankfort Armory had an indoor firing range in the basement that was closed prior to 2001. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that may include book sales.

V. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for heavy metal contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – West Frankfort Armory

VI. Findings, Discussion, and Recommendations

The West Frankfort Armory is the base of operations for Alpha Company 130th Infantry. Site personnel reported that no major vehicle maintenance is performed at the armory. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for three heavy metals (lead, cadmium and chromium). Some of the sample results were below the limit of detection for the metals and other results indicated that metals were detected, mostly at lower levels. The results are contained in Table 1.

At present, there are no regulated or recommended levels for surface levels of heavy metals in military facilities. There are no OSHA regulated levels for these heavy metals on surfaces. For the purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered significant. Three of the surface wipe sample results exceeded the above criteria. Sample ILWFW1 which was collected in the basement, on the floor in the former bullet trap area, had a lead concentration of 520 ug/ft^2 and a chromium concentration of 300 ug/ft^2. Sample ILWFW2 which was collected in the basement, on the floor in the center of the room, had a lead concentration of 300 ug/ft^2. Sample ILWFW3 which was collected in the basement, on the floor

near the entrance, had a lead concentration of 350 ug/ft^2. The West Frankfort Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Heavy Metals

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for multiple metals. The cadmium, chromium and lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method. At present there are no regulated or recommended levels for surface levels of heavy metals in military facilities. For purposes of this report, any level of any metal that exceeds 200 ug/ft^2 is considered excessive (or significant).

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Lighting levels were evaluated based on criteria established by the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) Recommended Practice for Lighting Industrial Facilities RP-7-2001 (ANSI/IESNA RP-7-2001).

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5

Industrial Hygiene Survey Report

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, West Frankfort Armory, located in West Frankfort, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The West Frankfort Armory was built in 1958, and has about 20,379 square feet of floor space. The armory is the base of operations for Alpha 2nd 130th Infantry. During the week, most of the activities at the armory involve administrative work. The West Frankfort Armory had an indoor firing range (IFR) in the basement that was closed in 1997 and converted to a weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory has not been used for community activities since 2005.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. Two of the surface wipe sample results exceeded the NGB criteria for lead. A sample collected in the weight room in the basement near the entrance to the former IFR, had a lead concentration of 420 ug/ft^2. A sample collected in the weight room in the basement near the bullet trap area in the former IFR had a lead concentration of 1,100 ug/ft^2.

Residual surface lead contamination remains from the former indoor firing range in the basement. The site should clean up the residual surface lead contamination in the basement weight room. The armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the West Frankfort Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in some office, support, and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, West Frankfort Armory, located in West Frankfort, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on December 10, 2012.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The West Frankfort Armory was built in 1958, and has about 20,379 square feet of floor space. The armory is the base of operations for Alpha 2nd 130th Infantry. During the week, most of the activities at the armory involve administrative work. The West Frankfort Armory had an indoor firing range (IFR) in the basement that was closed in 1997 and converted to a weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory has not been used for community activities since 2005.

IV. Scope of Work

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey. Photographs were taken, as appropriate.

Figure 1 – West Frankfort Armory

V. Findings, Discussion, and Recommendations

The West Frankfort Armory is the base of operations for Alpha 2nd 130th Infantry. During the week, most of the activities at the armory involve administrative work. The West Frankfort Armory had a firing range in the basement that was closed in 1997 and converted to a weight room. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. Site personnel reported that the armory has not been used for community activities since 2005.

Surface Wipe Samples

Five samples were collected on representative surfaces in the facility and analyzed for lead. The results are contained in Table 1. Wipe sample locations are identified in Figure 2. The NGB surface wipe sampling criteria for lead is contained in Table 2.

Two of the surface wipe sample results exceeded the NGB criteria for lead. Sample ILWFW13, which was collected in the weight room in the basement near the entrance to the former IFR, had a lead concentration of 420 ug/ft^2. Sample ILWFW15, which was collected in the weight room in the basement near the bullet trap area in the former IFR had a lead concentration of 1,100 ug/ft^2.

Residual surface lead contamination remains from the former indoor firing range in the basement. The site should clean up the residual surface lead contamination in the basement weight room. The armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4

I. Executive Summary

At the request of the Department of the Army, National Guard Bureau (NGB) field personnel representing the NGB Region West Industrial Hygiene Office conducted an industrial hygiene survey at the Illinois Army National Guard, Woodstock Armory, located in Woodstock, Illinois. This survey was conducted as part of the Army National Guard occupational safety and health program to evaluate potential personnel exposure to contaminants generated during typical activities performed at this facility.

The Woodstock Armory was built in 1996 and it has about 23,400 square feet of floor space. The armory is the base of operations for Company D, 1 –178th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. The Woodstock Armory has an indoor firing range that was built in 1993. Site personnel reported that it was never used. Weapons may be cleaned in the vault, in the supply room, or on tables set up on the drill floor. The armory is available for rental for community activities that include the Boy Scouts Pinewood Derby.

The industrial hygiene survey included a walkthrough of the facility and interviews with employees. The survey also included: collecting surface wipe samples for lead contamination and a lighting survey.

Five samples were collected on representative surfaces in the facility and analyzed for lead. One of the surface wipe sample results exceeded the NGB criteria. A sample collected on the bullet trap in the rifle range had a lead concentration of 473 ug/ft^2. The surface wipe sample results were consistent with an industrial hygiene survey that was performed at the facility on August 10, 2007. That survey identified lead levels on the bullet trap that ranged from 280 ug/ft^2 to 790 ug/ft^2.

The Woodstock Armory should continue to prohibit the presence of food and drink in work areas, stress the importance of hand washing prior to the consumption of food items and continue to clean the horizontal surfaces in work and storage areas. When weapons are cleaned, special attention should be given to cleaning up the work area to prevent potential lead contamination from ammunition.

A lighting survey was conducted in the offices and storage areas in the Woodstock Armory. Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in most of the offices and storage areas.

II. Introduction

An Occupational Health and Industrial Hygiene Evaluation was conducted by the West Region of the Army National Guard at the Illinois Army National Guard, Woodstock Armory, located in Woodstock, Illinois. This survey was conducted in order to identify exposure levels to hazardous chemical, physical, and biological agents occurring to Army National Guard employees while engaged in a full range of work responsibilities and tasks. Non-Responsive, Certified Industrial Hygienist (CIH), Certified Professional Ergonomist (CPE) conducted this survey on March 8, 2013.

The NGB conducted this survey in the interest of preventing employee illness and in meeting legal obligations where applicable. Based on information provided, every effort was made to conduct a comprehensive survey covering the parameters considered. Results and recommendations are based on information provided, field measurements, and conditions observed during the survey.

III. Site Description

The Woodstock Armory was built in 1996 and it has about 23,400 square feet of floor space. The armory is the base of operations for Company D, 1 –178th Infantry. During the week, most of the activities at the armory involve administrative work. Site personnel reported that no major vehicle maintenance is performed at the armory. No vehicle maintenance was performed on the day of the survey. The Woodstock Armory has an indoor firing range that was built in 1993. Site personnel reported that it was never used. Lighting Survey

A lighting survey was conducted in the offices and storage areas in the Woodstock Armory. The results are contained in Table 3. NGB lighting criteria are contained in Table 4.

Table 3
Lighting Survey
Illinois Army National Guard
Woodstock Armory
Woodstock, Illinois
March 8, 2013

Location	Illumination (foot candles)
Room 108, Office	16-30
Room 104, Office	18-23
Room 107, Office	68-83
Drill Floor	6-22
Room 134, Supply Office	44-55
Supply Bay	4-7
Vault	3-7
Kitchen	15-28
Room 138, Food Storage	10-23
Room 138, Scullery	20-44
Room 110B, Weight Room	22-33
Room 110A, Office	26-35
Room 109B, Classroom	30-43
Room 123, Mechanical	11-17
Room 126, Women's Locker	5-28
Room 127, Rifle Range	1-18

ANSI/IESNA RP-1-04
ANSI/IESNA RP-7-01
NGB Design Guides, 2011

Most of the areas surveyed did not meet minimum illumination requirements. Illumination levels should be improved in most of the offices and storage areas.

Recommendation:

Increase the illumination levels in the areas that did not meet minimum illumination requirements. (**RAC 4**)

This survey was conducted by, and report written by Non-Responsive, CIH, CPE as a representative of the NGB. This survey report was reviewed by Non-Responsive, Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Technical Assistance: For technical assistance regarding information found in this report or the performed survey please contact the Regional Industrial Hygienist at the NGB ARNG Region West Industrial Hygiene Office.

Methodology and Assessment Criteria

Methods used in this survey to collect surface wipe samples are listed below. The sampling strategy used in this survey was designed to characterize employee exposure to the various contaminants that could be generated from the various activities/tasks performed in the facility. It was based, in part, on information provided by site personnel.

Surface sampling reported in this survey represents the work conditions existing at the time of the survey. Changes in work practices and/or processes may change employee exposure levels. Use of different materials may result in exposure to a different air contaminant.

Surface Sampling – Lead

Surface samples were collected from representative areas using Environmental Express Ghost™ Wipes and templates that encompassed 100 centimeters squared (cm^2) of surface area. The entire area was wiped using an "S" configured motion, the Ghost™ Wipe was then folded in half and the area was again wiped in a direction 90^0 to the first using an "S" motion. The wipe was folded again and the perimeter of the area was wiped. The wipe was then placed into a plastic cylinder, the cylinder was capped and sealed and the samples were sent to the FOH Laboratory in Chicago, Illinois, for analysis for lead. The lead samples were analyzed on a Perkin Elmer 200 flame atomic absorption spectrophotometer using the OSHA ID-121 method.

Lighting Levels

Illumination levels were measured with a Sper Scientific 840022 Broad Range Lux/FC Meter that had been calibrated according to the manufacturer's specifications. Illumination levels were recorded as foot candles.

ANALYTICAL REPORT

Submitted To: USPHS / Federal Occupational Health
Denver Federal Center
Denver, CO 80225

Attention: Non-Responsive

Submitted By:

Reference Data: Lead

Sampling Site:	NGB: Woodstock, IL (Armory)
Sample Media:	Ghost Wipe(s)®
Method Reference:	OSHA ID-121
Project ID:	Project 10974
DFOH Lab Nos.:	TM-13-60045 through TM-13-60050
Date Received:	03/15/13
Data Analyzed:	03/20/13 - 03/21/13
Date Issued:	03/21/13

The wipe samples were hot plate digested. The samples were run on a Perkin Elmer 200 flame atomic absorption spectrophotometer (AA).

General Lab Comments:
All quality control criteria have been met.
* All samples received in condition acceptable for analysis unless otherwise noted.
** Sample results have not been corrected for contamination based on the field blank or other analytical blank unless otherwise noted.

Analytical results are given on the enclosed tables. Results relate only to items tested. If you have any questions about these results, feel free to phone the Laboratory at (312) 886-0413.

Appendix D

Occupational Health Risk Assessment Codes
(Reference: DOD Letter of Instructions 6055 1)

Occupational health risk assessment codes (RACs) are included in this report to quantify health risks to personnel risk assessment is an expression of health hazard severity and mishap probability, described in terms of route of exposure, actual exposure, exposure limit standards, potential health effects, duration of exposure, and number of exposed personnel The following procedure is used to determine the RACs:

STEP 1: This step assesses points to determine the health hazard severity category (HHSC) The HHSC reflects the magnitude of exposure to a physical, chemical, or biological agent and the medical effects of exposure

A Exposure Points Assessed

Alternate Route of Exposure		Exposure Conditions			
		<CT	Occasionally >CT	>CT	>STD
AER Possible	NO	0	3	5	7
	YES	1-2	4	6	8

Notes: 1) AER = Alternate exposure route, such as skin absorption or ingestion 2) CT = DoD component threshold that triggers surveillance actions, such as action level 3) STD = DoD exposure limit, such as TLV or PEL 4) > = Greater than 5) < = Less than 6) ≤ = Less than or equal to

B Medical Effects Points Assessed

Condition	Points
No medical effects, such as nuisance noise and nuisance odor	0
Temporary reversible illness requiring supportive treatment, such as eye irritation and sore throat	1-2
Temporary reversible illness with a variable but limited period of disability, such as metal fume fever	3-4
Permanent, nonsevere illness or loss of capacity, such as permanent hearing loss	5-6
Permanent, severe, disabling, irreversible illness or death, such as asbestosis or lung cancer	7-8

C The HHSC is determined by totaling the points assessed and using the following guide

Total Points*	HHSC
13-16	I
9-12	II
5-8	III
0-4	IV

* Sum of A and B above

STEP 2: This step uses the following guidelines to assess points to determine the mishap probability category (MPC) for health hazards The probability of mishap reflects the duration of exposure and the number of exposed personnel

A Duration of Exposure Points Assessed

Type of Exposure	Length of Exposure		
	1-8 hr/wk	>8 hr/wk/not continuous	Continuous
Irregular/Intermittent	1-2	4-6	NA
Regular/Periodic	2-3	5-7	8

B Number of Exposed personnel Points Assessed

Number of Exposed Personnel	Points
<5	1-2
5-9	3-4
10-49	5-6
>49	7-8

C The MPC for health hazards is determined by totaling the points assessed and using the following guide:

Total Points*	MPC
14-16	A
10-13	B
5-9	C
<5	D

* Sum of A and B above

STEP 3: The RAC is determined using the following matrix:

HHSC	MPC			
	A	B	C	D
I	1	1	2	3
II	1	2	3	4
III	2	3	4	5
IV	3	4	5	5
