10 October 2006

MEMORANDUM FOR Maryland Army National Guard (MDARNG) CFMO, LTC Robert McCabe, 5<sup>th</sup> Regiment Armory, 29<sup>th</sup> Division Street, Baltimore, MD 21201

SUBJECT: White Oak Readiness Center Indoor Firing Range

- 1. An email dated 09 October 2006 from the CFMO stated that the White Oak Readiness Center Indoor Firing Range conversion/construction project has been completed. This was based upon a physical inspection of the facility to ensure that it met requirements of the contract. The NGB Region North Industrial Hygiene Office certifies that the surface lead dust was abated IAW NG Pam 385-16, Converting Indoor Firing Ranges to Other Uses.
- 2. This project required the removal of the bullet trap, ceiling baffles and acoustical tile. Any items stored in the range were cleaned for surface lead dust prior to their removal. Surface lead dust was removed from all surfaces. Two coatings of lead paint encapsulant were used to cover the walls and ceiling. Vinyl tile was used to cover the floor.
- 3. This office collected pre and post surface lead wipe samples. The samples were sent to AMA Analytical Services, Inc. for analyses. AMA is an American Industrial Hygiene Association (AIHA) accredited laboratory. Post clearance surface lead wipe samples were below 200 micrograms per square foot as required by NG Pam 385-16.
- 4. Based on the email stated in paragraph 1 and the lead surface sample results, this area can be reoccupied as soon as possible.
- 5. Please direct any questions regarding the conversion/construction project to the CFMO at (410) 576-6067 and questions regarding surface lead dust sample results to Ms. Non-Responsive at (410) 942-0273 x23.

#### U.S. ARMY CENTER FOR HEALTH PROMOTION AND PREVENTIVE MEDICINE

The U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) lineage can be traced back over 50 years to the Army Industrial Hygiene Laboratory. That organization was established at the beginning of World War II and was under the direct jurisdiction of The Army Surgeon General. It was originally located at the Johns Hopkins School of Hygiene and Public Health, with a staff of three and an annual budget not to exceed \$3000. Its mission was to conduct occupational health surveys of Army operated industrial plants, arsenals, and depots. These surveys were aimed at identifying and eliminating occupational health hazards within the Department of Defense's (DOD) industrial production base and proved to be beneficial to the Nation's war effort.

Until 1995, it was nationally and internationally known as the U.S. Army Environmental Hygiene Agency or AEHA. Its mission is expanding to support the worldwide preventive medicine programs of the Army, DOD and other Federal Agencies through consultations/ supportive services; investigations and training.

Today, AEHA is redesignated the U.S. Army Center for Health Promotion and Preventive Medicine. Its mission for the future is to provide worldwide technical support for implementing preventive medicine, public health and health promotion/wellness services into all aspects of America's Army and the Army Community anticipating and rapidly responding to operational needs and adaptable to a changing work environment.

The professional disciplines represented at the Center include chemists, physicists, engineers, physicians, optometrists, audiologists, nurses, industrial hygienists, toxicologists, entomologists, and many other as well as sub-specialties within these professions.

The organization's quest has always been one of excellence and continuous quality improvement; and today its vision, to be the nationally recognized Center for Health Promotion and Preventive Medicine, is clearer than ever. To achieve that end, it holds ever fast to its values which are steeped in its rich heritage:

- ♦ Integrity is the foundation
- ♦ Excellence is the standard
- Customer satisfaction is the focus
- Its people are the most valued resource
- ◆ Continuous quality improvement is its pathway

The organization, which stands on the threshold of even greater challenges and responsibilities, has General Officer leadership. As it moves into the next century, new programs are being added related to health promotion/wellness, soldier fitness and disease surveillance. As always, its mission focus is centered upon the Army Imperatives so that we are trained and ready to enhance the Army's readiness for war and operations other than war.

It is an organization fiercely proud of its history, yet equally excited about the future. It is destined to continue its development as a world-class organization with expanded services to the Army, DOD, other Federal Agencies, the Nation and the World Community.

# EXECUTIVE SUMMARY MARYLAND ARMY NATIONAL GUARD FACILITIES INDUSTRIAL HYGIENE BASELINE SURVEYS, FIFTH REGIMENT ARMORY BALTIMORE, MD PROJECT NO. 55-ML-01ED-03

1. PURPOSE OF EVALUATION. To conduct surveys at Army National Guard (ARNG) facilities to identify and measure the existence and extent of potentially hazardous operations or conditions at ARNG facilities. The survey will serve to establish a baseline so that a worker's history of exposures is provided for each civilian or military employee.

#### 2. CONCLUSIONS.

- a. Indoor Air quality. The armory relative humidity of 60 % met the American Society of Heating, Refrigerating, and Air-Conditioning Engineers, Inc. (ASHRAE) recommended guidelines for air quality of 30%- 60% relative humidity. The indoor temperature of 77.1 degrees Fahrenheit was within the ASHRAE recommended guidelines for an acceptable thermal environment of 73-79 degrees Fahrenheit in the summer and 68-74.5 degrees Fahrenheit in the winter at 50 % relative humidity. The indoor carbon dioxide level of 429 ppm met the ASHRAE recommended guidelines. To alleviate occupant discomfort ASHRAE recommends that the carbon dioxide concentration in the room not exceed 700 parts per million (ppm) more than the outdoor ambient carbon dioxide concentration of 350 ppm. Therefore the total carbon dioxide level should not exceed approximately 1050 ppm in this armory. All air samples were below the laboratory analytical detection limit for lead in air of 3.0 to 15.0μg/m³ as well as the Occupational Health and Safety Administration (OSHA) standard of 50μg/m³ for lead in air. The POC stated that ventilation is poor in the Education Office.
- b. Lead. Eight dust-lead wipe sample results exceeded the USACHPPM recommended decontamination level of 200µg/ft² for dust-lead on frequently contacted surfaces (the range was 120 to 4,900,000µg/ft²). Fifteen dust-lead wipe sample results exceeded the EPA lead exposure level for children of 40µg/ft² on floors and the USACHPPM decontamination level of 200µg/ft² for all other surfaces. Dust-lead levels in the former IFR are extremely high. One sample exceeded 4,000,000µg/ft². Parts of the former IFR have never been fully cleaned and the IFR is now being used as a storage room. Personnel responsible for the storage in this room are potentially exposed to significant levels of lead, and are tracking lead out of the area and redistributing it into adjacent rooms in the armory. This can result in lead exposures for children and for the general workforce. There is also a potential for these personnel to take lead contamination out of the workplace into their vehicles and homes. One of five deteriorated paint sample results exceeded the EPA standard of 0.5 % lead and is lead-based paint. Deteriorated lead-based paint is hazardous to children. Two additional samples were below the definition of

Readiness thru Health
Printed on Recycled Paper

lead-based paint, but exceeded the laboratory analytical detection limits of 0.01 %. These samples are referred to as lead-contaminated paint, and are potentially hazardous to children and to the general workforce.

- c. There are vinyl asbestos floor tiles in this facility.
- d. Lead in water testing revealed all samples were below the EPA action level of 15 parts per billion (ppb) lead in water.
- 3. RECOMMENDATIONS. The Department of Defense Risk Assessment Codes (RAC) for Health Hazards enables one to prioritize remedial action for hazards. Risk Assessments Codes range in magnitude from 1 to 5, with 1 being the highest priority. The RAC for Lead Exposure in the former indoor firing range is classified as 4. The RAC for Lead Exposure throughout the rest of the armory is classified as 5. Clean all areas in and adjacent to the former IFR immediately and in other areas where sampling results showed the presence of dust-lead. Comprehensive guidelines are in Appendix F. Consult with the Maryland Armory Environmental Coordinator concerning waste disposal requirements after cleanup. If children will continue to use this facility, clean surfaces to the EPA dust-lead standard for young children of  $40\mu g/ft^2$  on floors and clean to  $200\mu g/ft^2$  for dust-lead on all other surfaces. Recleaning may further prevent lead from becoming redistributed into adjacent rooms and resulting in exposures for children and for the general workforce. Repair and stabilize deteriorated paint. A potential occupational exposure to lead has been identified for workers involved in renovation and abatement activities. These workers are required to be in compliance with the OSHA lead in construction standard 29 CFR 1926.62. There is a potential for personnel taking lead contamination out of the workplace into their vehicles and homes. Wear disposable gloves and disposable coveralls as extra protection when working in areas identified as having elevated levels of lead. The vinyl asbestos floor tiles are intact. If they become damaged in the future the asbestos tiles may become friable and asbestos fibers may be released. Army policy requires the armory to establish and execute an asbestos hazard management plan for all asbestos in the facility, and to take immediate corrective action where a possible asbestos-related health hazard has been identified. Test the ventilation in the Education Room.

SUBJECT: Maryland Army National Guard Facilities Industrial Hygiene Baseline Surveys, Project No. 55-ML-01ED-03

LOCATION: Fifth Regiment Armory Baltimore, MD

- 1. AUTHORITY. E-Mail dated 28 February 2003 from Ms Non-Responsive, Industrial Hygienist, MD Army National Guard, to the USACHPPM Industrial Hygiene Field Services Program.
- 2. PURPOSE OF EVALUATION. To conduct surveys at Army National Guard (ARNG) facilities to identify and measure the existence and extent of potentially hazardous operations or conditions at ARNG facilities. The survey will serve to establish a baseline so that a worker's history of exposures is provided for each civilian or military employee.
- 3. BACKGROUND INFORMATION.
- a. Armory Mission. State Headquarters for the Maryland National Guard. The armory also hosts the annual Maryland National Guard Indoor Scholastic Games with more than 2500 student athletes from 85 area high schools in individual and team competition in track and field exercises. The Fifth Regiment Armory also has been a key site for emergency operations during major snowstorms and civil unrest as a command operations site, including support of a Operation Desert Storm in 1990-91.
- b. Date of Construction. Originally built around 1910. It was destroyed by fire in 1926 and then rebuilt.
- c. POC. Staff Sergeant Non-Responsive, Environmental Compliance Assessment Coordinator for the MD NGB 410-576-6132.
  - d. Survey date. 08 September 2003.
- 4. SUMMARY OF ACTIONS.

- a. Sampling. Surface dust-lead wipe, air, water and bulk paint sampling was conducted to determine the existence of lead-based paint and/or lead-based paint hazards (paint-lead hazards). CO2, temperature, and relative humidity measurements were collected to determine indoor air quality. Sample locations are in Appendix D.
  - b. Physical Condition of Facilities.
- (1) Paint. Staff Sergeant Non-Responsive, Environmental Compliance Assessment Coordinator for the MD NGB, has records that state that lead has been abated in the armory. However, there is still deteriorated lead-based paint in the armory. Also there are extremely high levels of lead present in the former indoor firing range.
- (2) Asbestos. Staff Sergeant has records that state that all asbestos was abated in this armory. There are vinyl asbestos floor tiles still remaining in the Army Band Office.
  - (3) Mold. No mold was observed.
  - (4) Safety Hazards. No safety hazards were observed.
- c. Other Building Concerns. The POC stated that there is not enough ventilation in the education office.
- d. Safety and Industrial Hygiene Programs. There are no written program records at the armory.
- e. Heating, Ventilation, and Air-conditioning System. Ventilation and air are provided mainly by window-mounted air conditioning units and the manual operation of windows when the building is not being heated (80 % of the building). The remaining 20 % of the building space is made up of offices that have a central air conditioning system.
  - f. Noise Dosimetry. No operation that could produce hazardous noise levels was identified.
- g. Lighting. All areas appeared to be adequately lit and occupants reported no areas of deficient lighting.
- h. Converted indoor firing range (IFR). Parts of the former IFR have never been fully cleaned and the IFR is now being used as a storage room. All dust-lead levels in this room are extremely high, and some greatly exceed the USACHPPM and National Guard Bureau Region North Industrial Hygiene Office recommended surface decontamination level of  $200\mu g/ft^2$ .
  - i. Photographs (Appendix C).

- j. Site Maps (Appendix B).
- k. Facility use by children. The POC stated that a local high school holds track meets on the indoor track. Occasionally there are family support group dinners. There is an annual Irish festival and other occasional public events such as train shows held in the armory in which children participate.
- 5. ASSESSMENT CRITERIA FOR LEAD. (Appendix A).
- 6. SAMPLING RESULTS.
- a. Indoor Air Quality. The armory relative humidity of 60 % met the American Society of Heating, Refrigerating, and Air-Conditioning Engineers, Inc. (ASHRAE) recommended guidelines for air quality of 30%-60% relative humidity. The indoor temperature of 77.1 degrees Fahrenheit was within the ASHRAE recommended guidelines for an acceptable thermal environment of 73-79 degrees Fahrenheit in the summer and 68-74.5 degrees Fahrenheit in the winter at 50 % relative humidity. The outdoor carbon dioxide level was 350 parts per million (ppm). The indoor carbon dioxide level of 429 ppm was within the ASHRAE recommended guidelines. To alleviate occupant discomfort ASHRAE recommends that the carbon dioxide concentration in the room not exceed 700 ppm more than the outdoor ambient carbon dioxide concentration, which was 350 ppm. Therefore the total carbon dioxide level should not exceed approximately 1050 ppm in this armory.
- b. Lead. Eight dust-lead wipe sample results exceeded the USACHPPM recommended decontamination level of  $200\mu g/ft^2$  for dust-lead on frequently contacted surfaces (the range was 120 to  $4,900,000\mu g/ft^2$ ). Fifteen dust-lead wipe sample results also exceeded the EPA lead exposure level for children of  $40\mu g/ft^2$  on floors and the USACHPPM recommended decontamination level for  $200g/ft^2$  for dust-lead on all other surfaces. One of five deteriorated paint sample results was above the EPA standard of 0.5% lead and is lead-based paint. Deteriorated lead-based paint is hazardous to children. Two additional samples were below the definition of lead-based paint, but exceeded the laboratory analytical detection limits of 0.01%. These samples are referred to as lead-contaminated paint, and are potentially hazardous to children. The lead in water testing results are all below the EPA action level of 15 parts per billion (ppb).

Some dust-lead levels in the former IFR are extremely high. One sample result exceeds  $4,000,000\mu g/ft^2$ . All air samples were below the laboratory analytical detection limit for lead in air of 3.0 to  $15.0\mu g/m^3$  as well as the Occupational Health and Safety Administration (OSHA) standard of  $50\mu g/m^3$  for lead in air.

See Table 1 for dust-lead wipe and bulk paint sample locations, photograph numbers, and analytical results. All sample results that are equal to or exceed  $40\mu g/ft^2$  are highlighted.

Lead in water testing was conducted in this facility. The samples are currently being analyzed.

#### 7. DISCUSSION AND CONCLUSIONS.

a. Most of the building is in good condition. The armory generally observes good housekeeping practices.

MDARNG Facilities IH Baseline Surveys, Fifth Regiment Armory, Baltimore, MD Project No. 55-ML-01ED-03

b. The armory relative humidity of 60 % met the ASHRAE recommended guidelines for air quality of 30%-60% relative humidity. The indoor temperature of 77.1 degrees Fahrenheit was within the ASHRAE recommended guidelines for an acceptable thermal environment of 73-79 degrees Fahrenheit in the summer and 68-74.5 degrees Fahrenheit in the winter at 50 % relative humidity.

The indoor carbon dioxide level of 429 ppm met the ASHRAE recommended guidelines. To alleviate occupant discomfort ASHRAE recommends that the carbon dioxide concentration in the room not exceed 700 ppm more than the outdoor ambient carbon dioxide concentration of 350 ppm. Therefore, the total carbon dioxide level should not exceed approximately 1050 ppm in this armory.

- c. All air samples were below the laboratory analytical detection limit for lead in air of  $3.0 \text{ to } 15.0 \mu\text{g/m}^3$  as well as the Occupational Health and Safety Administration (OSHA) standard of  $50 \mu\text{g/m}^3$  for lead in air.
- d. Eight dust-lead wipe sample results exceeded the USACHPPM recommended decontamination level of  $200\mu g/ft^2$  for dust-lead on frequently contacted surfaces (the range was 120 to 4,900,000 ug/ft2). Fifteen dust-lead wipe sample results also exceeded the EPA lead exposure level for children of 40ug/ft2 on floors and the USACHPPM decontamination level of  $200\mu g/ft^2$  for dust-lead on all other surfaces.
- e. Dust-lead levels in the former IFR are extremely high. Parts of the former IFR have never been fully cleaned and the IFR is now being used as a storage room. Personnel responsible for the storage in this room are potentially exposed to significantly high levels of lead, and are tracking lead out of the area and redistributing lead into adjacent rooms in the armory. This can result in lead exposures for children and for the general workforce.
- f. One of five deteriorated paint sample results was above the EPA standard of 0.5 % lead and is lead-based paint. Deteriorated lead-based paint is hazardous to children. Two additional samples were below the definition of lead-based paint, but exceeded the laboratory analytical detection limits of 0.01 %. These samples are referred to as lead-contaminated paint, and are potentially hazardous for children exposed to this paint.
- g. Army Regulation 420-70 states that the purpose of Army lead hazard management is to protect children from all sources of lead exposure. However, its provisions only control these exposures, and do not eliminate them. Recleaning the areas that showed dust-lead may further prevent exposures for children and for the general workforce. Lead in water testing has been conducted in this facility and samples are currently being analyzed.
  - h. The water samples are below the EPA action levels for lead.

- i. The vinyl asbestos floor tiles are intact. If they become damaged in the future the asbestos tiles may become friable and asbestos fibers may be released. Army policy requires the armory to establish and execute an asbestos hazard management plan for all asbestos in the facility, and to take immediate corrective action where a possible asbestos-related health hazard has been identified.
- 8. RECOMMENDATIONS, Enclosure.
- 9. ADDITIONAL ASSISTANCE. For additional assistance, or questions concerning this report, please contact the undersigned at DSN 584-3118, commercial 410-436-3118, or by e-mail Non-Responsive apg.amedd.army.mil.

#### **ENCLOSURE**

#### FIFTH REGIMENT ARMORY RECOMMENDATIONS

The Department of Defense Instruction Number (DODI) 6055.1 provides Risk Assessment Codes (RAC) for Health Hazards, a procedure which allows us to assess the magnitude of exposure to physical, chemical, and biological agents and the possible medical effects of exposure. The RAC is an expression of the risk associated with the hazard and combines the hazard severity and accident probability into a single numeral. RACs enable one to prioritize hazards. They range in magnitude from 1 to 5, with 1 being the highest priority. The RAC for Lead Exposure in the former indoor firing range is classified as 4. The RAC for all other areas of this armory for Lead Exposure is classified as 5. The RAC for asbestos exposure is classified as 5.

- 1. Lead Exposure in Former Firing Range. RAC 4. Lead Exposure in all other areas of the armory: RAC 5.
- a. Clean all areas in and adjacent to the former IFR immediately and other areas where sampling results showed elevated levels of lead. Comprehensive guidelines are in Appendix F. Consult with the Maryland Armory Environmental Coordinator concerning waste disposal requirements after cleanup. Apply a sealant to the area. Recleaning and sealing the IFR may further prevent lead from becoming redistributed into adjacent rooms and resulting in exposures for children and for the general workforce. Address all potential lead hazards before extending this facility to use for children. If children will be using this facility, clean surfaces to the EPA dust-lead standard for young children of  $40\mu g/ft^2$  on floors and clean to the USACHPPM decontamination level of  $200\mu g/ft^2$  for dust-lead on all other surfaces.
  - b. Repair and stabilize deteriorated paint.
- c. A potential occupational exposure to lead has been identified for workers involved in renovation and abatement activities. These workers are required to be in compliance with the OSHA lead in construction standard 29 CFR 1926.62.
- d. There is a potential for personnel taking lead contamination out of the workplace into their vehicles and homes. Wear disposable gloves and disposable coveralls as extra protection when working in areas identified as having elevated levels of lead.
- 2. Asbestos Exposure. RAC 5.

MDARNG Facilities IH Baseline Surveys, Fifth Regiment Armory, Baltimore, MD Project No. 55-ML-01ED-03

The vinyl asbestos floor tiles are intact. If they become damaged in the future the asbestos tiles may become friable and asbestos fibers may be released. Army policy requires the armory to establish and execute an asbestos hazard management plan for all asbestos in the facility, and to take immediate corrective action where a possible asbestos-related health hazard has been identified.

3. Additional Recommendations. Test the ventilation in the Education Room.

MDARNG Facilities IH Baseline Surveys,  $5^{th}$  Regiment Armory, Baltimore, MD Project No. 55-ML-01ED-03

#### APPENDIX A

ASSESSMENT CRITERIA FOR LEAD

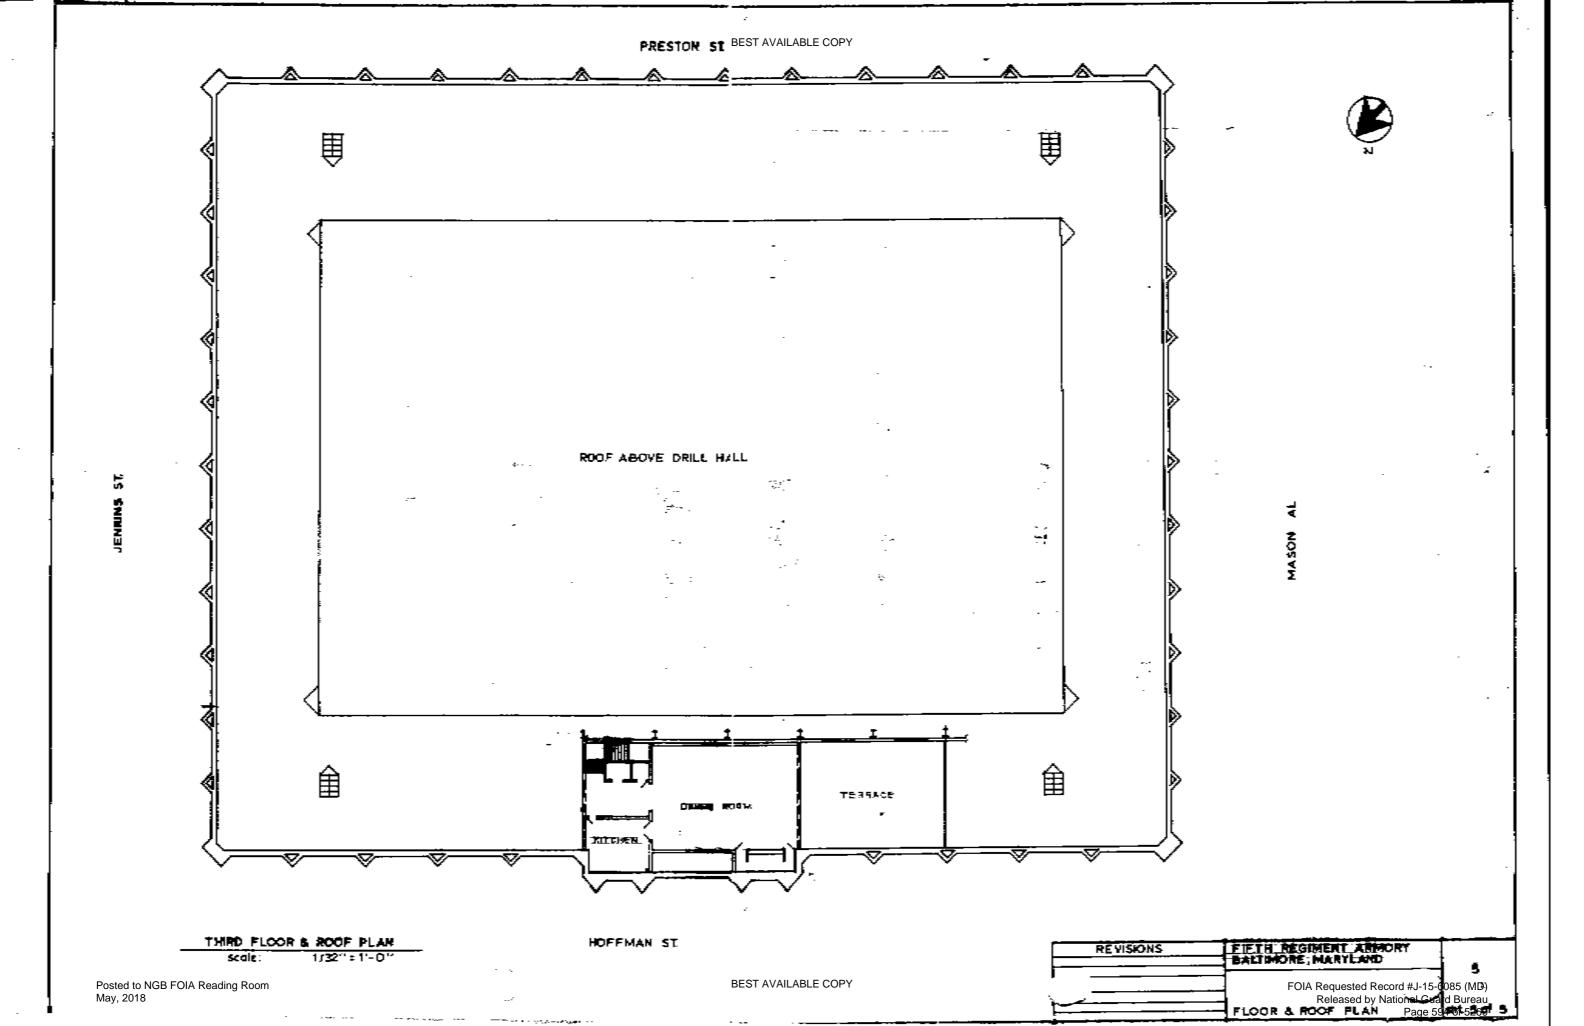

Subject: Proposed Recommendations for Surface Lead in Armories

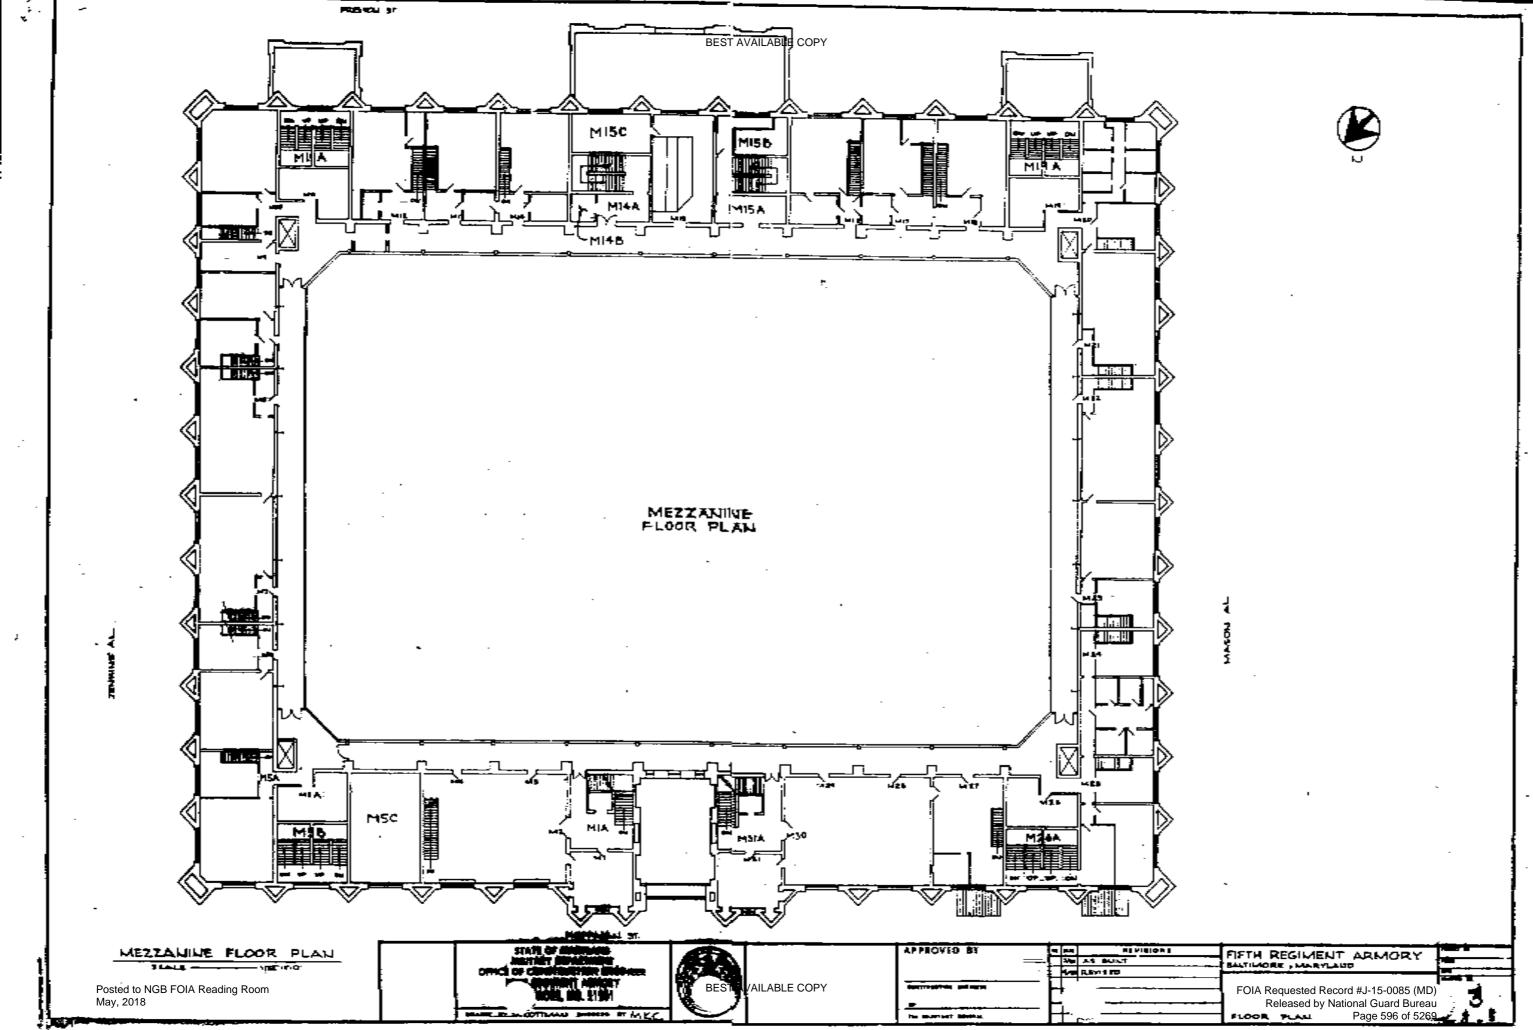

- 1. In armories that do not contain childcare facilities, the NGB Region North Industrial Hygiene Office recommends cleaning the areas in which sample results are greater than  $200 \,\mu\text{g/ft}^2$ . This guidance is based on professional judgment, risk assessments, adaptation of OSHA guidance, and feasibility of cleaning to a certain level.
- a. EPA standards (40 CFR 745.227(e)(8)(viii)) are not directly applicable because they are developed for floors (40  $\mu$ g/ft²), windowsills (250  $\mu$ g/ft²) and window troughs (400  $\mu$ g/ft²) in residential and childcare facilities. Most of the wipe samples in armories were collected in undisturbed areas and therefore, results are worst case scenarios and do not correlate to these standards.
- b. OSHA has no specific requirement for work area surfaces. The lead standard (29 CFR 1910.1025(h)) states that all surfaces shall be maintained as free as practicable of accumulations of lead. In workplaces where lead is generated, surface levels may be much higher, but personnel exposures can be controlled by limiting airborne lead levels and following good cleanup and hygienic practices.
- c. OSHA used to cite a level of 200  $\mu$ g/ft<sup>2</sup> in their Technical Manual and 29 CFR 1926.62 as guidance to its own inspectors for evaluating the cleanliness of lunchroom and locker room surfaces that are supposed to be kept as clean as possible.
- d. In a report titled Derivation of Wipe Surface Screening Levels for Environmental Chemicals, USACHPPM has determined that  $200 \,\mu\text{g/ft}^2$  is a safe surface contamination level. They have also applied these standards as the decontamination levels for surfaces in administrative offices.
- e. It should be noted that levels above these recommendations do not necessarily mean there is a significant hazard to workers who are following good cleaning and hygienic practices since there is no correlation between wipe and air samples. Rather, we recommend these levels as a precautionary measure.
- 2. The NGB Occupational Health Branch is developing guidance for armories that are used as childcare facilities. All states will receive this guidance when it is completed.
- 3. Ambient air samples collected in the armory were well below OSHA's permissible exposure limit for lead (29 CFR 1910.1025(c)) of 0.05 mg/m<sup>3</sup> averaged over an 8-hour day. Therefore, based on these conditions there is currently no overexposure to personnel from lead in this building.

### Step-by-Step Summary

# Cleaning: How To Do It

- Include step-by-step procedures for precleaning, cleaning during the job, and daily and final cleanings in project design or specifications.
- 2. Assign responsibilities to specific workers for cleaning and for maintaining cleaning equipment.
- 3. Have sufficient cleaning equipment and supplies before beginning work.
- 4. If contamination is extensive, conduct precleaning of the dwelling unit. Move or cover all furniture and other objects.
- Conduct ongoing cleaning during the job, including regular removal of large and small debris and dust.
   Decontamination of all tools, equipment, and worker protection gear is required before it leaves containment areas. Electrical equipment should be wiped and high-efficiency particulate air (HEPA) vacuumed, not wetted down, to minimize electrocution hazards.
- 6. Schedule sufficient time (usually 30 minutes to an hour) for a complete daily cleaning, starting at the same time near the end of each workday after lead hazard control activity has ceased.
- For final cleaning, wait at least 1 hour after active lead hazard control activity has ceased to let dust particles settle.
- Use a vacuum cleaner equipped with a HEPA exhaust filter. HEPA vacuum all surfaces in the room (ceilings, walls, trim, and floors). Start with the ceiling and work down, moving toward the entry door. Completely clean each room before moving on.
- Wash all surfaces with a lead-specific detergent, high-phosphate detergent, or other suitable cleaning agent to dislodge any ground-in contamination, then rinse. Change the cleaning solution after every room is cleaned.
- 10. Repeat step 8. To meet clearance standards consistently, a HEPA vacuum, wet wash, and HEPA vacuum cycle is recommended. For interim control projects involving dust removal only, the final HEPA vacuuming step is usually not needed (see Chapter 11). Other cleaning methods are acceptable, as long as clearance criteria are met and workers are not overexposed.
- 11. After final cleaning, perform a visual examination to ensure that all surfaces requiring lead hazard control have been addressed and all visible dust and debris have been removed. Record findings and correct any incomplete work. This visual examination should be performed by the owner or an owner's representative who is independent of the lead hazard control contractor.
- 12. If other construction work will disturb the lead-based paint surfaces, it should be completed at this point. If those surfaces are disturbed, repeat the final cleaning step after the other construction work has been completed.
- 13. Paint or otherwise seal treated surfaces and interior floors.
- 14. Conduct a clearance examination (see Chapter 15).
- 15. If clearance is not achieved, repeat the final cleaning.

### -Step-by-Step Summary (continued) -

- 16. Continue clearance testing and repeated cleaning until the dwelling achieves compliance with all clearance standards. As an incentive to conduct ongoing cleaning and a thorough final cleaning, the cost of repeated cleaning after failing to achieve clearance should be borne by the contractor as a matter of the job specification, not the owner.
- 17. Do not allow residents to enter the work area until cleaning is completed and clearance is established.
- 18. Cleaning equipment list:
  - ♦ HEPA vacuums.
  - Detergent.
  - ♦ Waterproof gloves.
  - Rags.
  - Sponges.
  - Mops.
  - Buckets.
  - ♦ HEPA vacuum attachments (crevice tools, beater bar for cleaning rugs).
  - 6-mil plastic bags.
  - Debris containers.
  - Waste water containers.
  - Shovels.
  - Rakes.
  - Water-misting sprayers.
  - 6-mil polyethylene sheeting (or equivalent).

### I. Introduction

This chapter describes cleaning procedures to be employed following abatement and interim control work. Dust removal as an interim control measure is covered in Chapter 11.

All lead hazard control activities can produce dangerous quantities of leaded dust. Unless this dust is properly removed, a dwelling unit will be more hazardous after the work is completed than it was originally. Once deposited, leaded dust is difficult to clean effectively. Whenever possible, ongoing and daily cleaning of leaded dust during lead hazard control projects is recommended. Ongoing and daily cleaning is also necessary to minimize worker exposures.

Cleaning is the process of removing visible debris and dust particles too small to be seen by the naked eye. Removal of lead-based paint hazards in a dwelling unit will not make the unit safe unless excessive levels of leaded dust are also removed. This is true regardless of whether the dust was present before or generated by the lead hazard control process itself. Improper cleaning can increase the cost of a project considerably because additional cleaning and clearance sampling will be necessary. However, cleaning and clearance can be achieved routinely if care and diligence are exercised.

### A. Performance Standard

Although the cleaning methods described in this chapter are feasible and have been shown to be effective in meeting clearance standards, other methods may also be used if they are safe and effective. This performance-oriented approach should stimulate innovation, reduce cost, and ensure safe conditions for both residents and workers.

### B. Small Dust Particles

Dust particles that are invisible to the naked eye remain on surfaces after ordinary cleaning procedures. A visibly clean surface may contain high and unacceptable levels of dust particles and require special cleaning procedures.

### C. Difficulties in Cleaning

While cleaning is an integral and essential component of any lead hazard control activity, it is also the most likely part of the activity to fail.

Several common reasons for this failure include low clearance standards, worker inexperience, high dust-producing methods, and deadlines.

### 1. Low Clearance Standards

Because very small particles of leaded dust are easily absorbed by the body when ingested or inhaled, a small amount can create a health hazard for young children. Therefore, "clearance standards" are extremely low for acceptable levels of leaded dust particles on surfaces after hazard control activities, and careful cleaning procedures are required. Although it is not possible to remove all leaded dust from a dwelling, it is possible to reduce it to a safe level.

Clearance standards are described more fully in Chapter 15. The permissible amount of leaded dust remaining on each of the following surfaces following lead hazard work is as follows:

- 100 μg/ft² on floors.
- 500 µg/ft² on interior window sills (stools).
- 800 μg/ft² on window troughs (the area where the sash sits when closed).
- 800 μg/ft² on exterior concrete.

These levels are based on wipe sampling.
Clearance testing determines whether the premises or area are clean enough to be reoccupied after the completion of a lead paint hazard control project. A cleaned area may not be reoccupied until compliance with clearance standards has been established. To prevent delays, final testing and final cleaning activities should be coordinated.

### 2. Worker Inexperience

To understand the level of cleanliness required to meet the established clearance standards for hazard control cleanup, new hazard control personnel often require a significant reorientation to cleaning. Many construction workers are used to cleaning up only dust that they can see, not the invisible dust particles that are also important to remove.

# 3. High Dust-Producing Methods and/or Inadequate Containment

High dust-generating methods, inadequate containment during hazard control work, and poor work practices can all make achievement of clearance particularly difficult. Work practices necessary to prevent spreading of dust throughout a dwelling (e.g., by tracking dust out of work areas) are essential but sometimes tedious. Essential work practices are sometimes mistakenly considered to be "flexible guidelines" rather than necessary standards that are designed to ensure that the job is completed, not only safely, but also on time and within budget.

### 4. Deadlines

Daily and final cleanings have sometimes been compromised due to project deadlines, since cleaning comes at the end of the job. Hurried efforts often result in clearance failure. Delayed and over-budget hazard control projects are often the result of repeated, unplanned recleanings that are necessitated by inadequate containment and sloppy work practices.

### II. Coordination of Cleaning Activities

### A. Checklist

The owner or contractor may use the following cleaning checklist before any lead hazard control activity:

- ✓ Is the critical importance of cleaning in a hazard control project understood?
- ✓ Have all workers been trained and certified for hazard control work?

- ✓ Have the precleaning, daily, and final cleanings been scheduled properly and coordinated with the other participants in the hazard control process?
- ✓ Have cleaning equipment and materials been obtained?
- ✓ Do the workers know how to operate and maintain special cleaning equipment, and do they have directions for the proper use of all cleaning materials?
- ✓ Have all workers carefully studied the step-by-step procedures for precleaning (if needed), in-progress cleaning, and daily and final cleanings?
- ✓ Are all workers properly protected during the cleaning processes (see Chapter9)?
- ✓ Have provisions been made to properly contain and store potentially hazardous debris (see Chapter 10)?
- ✓ Have dust-clearance testing and related visual inspections been arranged (see Chapter 15)?
- ✓ Are the clearance criteria to be met fully understood?
- ✓ Have all appropriate surfaces been properly painted or otherwise sealed?
- ✓ Have appropriate records been maintained that document participants' roles in the hazard control project?

### B. Equipment Needed for Cleaning

The following equipment is needed to conduct cleaning: high-efficiency particulate air (HEPA) vacuums and attachments (crevice tools, beater bar for cleaning rugs), detergent, waterproof gloves, rags, sponges, mops, buckets, 6-mil plastic bags, debris containers, waste water containers, shovels, rakes, water-misting sprayers, and 6-mil polyethylene plastic sheeting (or equivalent).

### C. Waste Disposal

Regulations governing hazardous and nonhazardous waste storage, transportation, and disposal affect both the daily and final cleaning procedures. The hazard control contractor and the disposal contractor should work together to establish formal written procedures, specifying selected containers, storage areas, and debris pickups, to ensure that all relevant regulations are met.

# III. Cleaning Methods and Procedures

Many of the special cleaning methods and procedures detailed in this chapter are not standard operating procedure for general home improvement contractors. Therefore, project designers, responsible agencies, or owners must ensure that contractors follow the methods and procedures recommended herein or specially designed alternative procedures, even though some may appear to be redundant and unnecessary. These methods have been shown to be feasible and effective in many situations and skipping steps in the cleaning procedures can be counterproductive.

### A. Containment

Because of the difficulty involved in the removal of fine dust, dust generated by hazard control work should be contained to the extent possible to the inside of work areas. Inadequately constructed or maintained containment or poor work practices will result in additional cleaning efforts, due to dust that has leaked out or been tracked out of the work area (see Chapter 8).

### B. Basic Cleaning Methods: Wet Wash and Vacuum Cleaning Techniques

Because leaded dust adheres tenaciously, especially to such rough or porous materials as weathered or worn wood surfaces and masonry surfaces (particularly concrete), workers should be trained in cleaning methods. As a motivator,

some contractors have awarded bonuses to workers who pass clearance the first time.

Two basic cleaning methods have proven effective, when used concurrently, in lead-based paint hazard control projects: a special vacuum cleaner equipped with a HEPA exhaust filter, followed by wet washing with special cleaning agents and rinsing, followed by a final pass with the HEPA vacuum.

Although HEPA filtered vacuums and triso-dium phosphate (TSP) cleaners have been considered the standard cleaning tools for lead hazard control projects, new research, discussed under the "Alternatives Methods" section in this chapter, suggests that other tools and products may also be effective in efficiently cleaning dust while providing adequate worker protection from airborne exposure risks. Some of these innovations may even be superior.

### 1. HEPA Vacuuming

HEPA vacuums differ from conventional vacuums in that they contain high-efficiency filters that are capable of trapping extremely small, micron-sized particles. These filters can remove particles of 0.3 microns or greater from air at 99.97 percent efficiency or greater. (A micron is 1 millionth of a meter, or about 0.00004 inches.) Some vacuums are equipped with an ultra-low penetration air (ULPA) filter that is capable of filtering out particles of 0.13 microns or greater at 99.9995 percent efficiency. However, these ULPA filters are slightly more expensive, and may be less available than HEPA filters.

Vacuuming with conventional vacuum machines is unlikely to be effective, because much of the fine dust will be exhausted back into the environment where it can settle on surfaces. A recent Canadian study revealed that finedust air levels were exceedingly high when a standard portable vacuum with a new bag was used, although partially filled bags were found to be more efficient (CMHC, 1992). Considerations for the proper use of a HEPA vacuum are listed below.

### Operating Instructions

There are a numerous manufacturers of HEPA vacuums. Although all HEPA vacuums operate on the same general principle, they may vary considerably with respect to specific procedures, such as how to change the filters. To ensure the proper use of equipment, the manufacturer's operating instructions should be carefully followed and if possible, training sessions arranged with the manufacturer's representative.

Although HEPA vacuums have the same "suction" capacity as ordinary vacuums that are comparably sized, their filters are more efficient. Improper cleaning or changing of HEPA filters may reduce the vacuum's suction capability.

### Special Attachments

Because the HEPA vacuum will be used to vacuum surfaces other than floors, operators should buy attachments and appropriate tool kits for use on different surfaces—such as brushes of various sizes, crevice tools, and angular tools.

### Selecting Appropriate Size(s)

HEPA vacuums are available in numerous sizes, ranging from a small lunchbucket-sized unit to track-mounted systems. Two criteria for size selection are the size of the job and the type of electrical power available. Manufacturer recommendations should be followed.

### Wet-Dry HEPA Vacuums

Some hazard control contractors have found the wet-dry HEPA vacuums to be particularly effective in meeting clearance standards. These vacuums are equipped with a special shut-off float switch to protect the electrical motor from water contact.

### Prefilters

HEPA filters are usually used in conjunction with a prefilter or series of prefilters that trap the bulk of the dust in the exhaust airstream, particularly the larger particles. The HEPA filter traps most of the remaining small particles that have passed through the prefilter(s). All filters must be maintained and replaced or

cleaned as specified in the manufacturer's instructions. Failure to do so may cause a reduction in suction power (thus reducing the vacuum's efficiency and effectiveness). Failure to change prefilters may damage the vacuum motor and will also shorten the service life of the HEPA filter, which is far more expensive than the prefilters.

### **HEPA Vacuuming Procedures**

Surfaces frequently vacuumed include ceilings, walls, floors, windows, interior and exterior sills, doors, heating, ventilation, and air conditioning (HVAC) equipment (heating diffusers, radiators, pipes, vents), fixtures of any kind (light, bathroom, kitchen), built-in cabinets, and appliances.

To aid in dislodging and collecting deep dust and lead from carpets, the HEPA vacuum must be equipped with a beater bar (agitator head) that is fixed to the cleaning head. This bar should be used on all passes on the carpet face during dry vacuuming (see Chapter 11 for details on carpet and furniture cleaning).

All rooms and surfaces should be included in the HEPA vacuum process, except for those that (1) were found not to have lead-paint hazards and were properly separated from work areas before the process began (see Chapter 8), or (2) were never entered during the process. Porches, sidewalks, driveways, and other exterior surfaces should be vacuumed if exterior hazard control work was conducted, or if debris was stored or dropped outside. Vacuuming should begin on the ceilings and end on the floors, sequenced to avoid passing through rooms already cleaned, with the dwellings' entryway cleaned last.

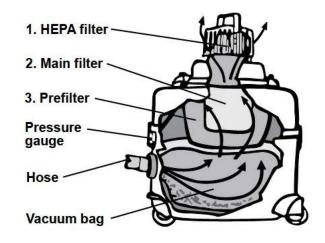

### Emptying the HEPA Vacuum

Used filters and vacuumed debris are potentially hazardous waste and should be treated accordingly (see Chapter10). Therefore, operators should use extreme caution when opening the HEPA vacuum for filter replacement or debris removal to avoid accidental release of accumulated dust into the environment. This may occur, for example, if the vacuum's seal has been broken and the vacuum's bag is disturbed.

Figure 14.1a Vacuum With a HEPA Filter.

### Parts of a HEPA-vacuum

Most HEPA-vacuums have three filters: HEPA filter, main filter, and prefilter. Debris gets sucked in through the hose into the vacuum bag. The air and dust get filtered through the prefilter, the main filter, and the HEPA filter. The HEPA filter captures the lead dust before the air is released into the work area again.

Operators should also wear a full set of protective clothing and equipment, including appropriate respirators, when performing this maintenance function, which should be done in the containment area or offsite.

### 2. Wet Detergent Wash

Several types of detergents have been used to remove leaded dust. Those with a highphosphate content (containing at least 5 percent trisodium phosphate, also known as TSP) have been found to be effective when used as part of the final cleaning process (Milar, 1982). TSP detergents are thought to work by coating the surface of dusts with phosphate or polyphosphate groups which reduces electrostatic interactions with other surfaces and thereby permits easier removal. Because of environmental concerns some States have restricted the use of TSP, and some manufacturers have eliminated phosphates from their household detergents. However, high-TSP detergents can usually be found in hardware stores and may be permitted for limited use, such as lead hazard control.

Other non-TSP cleaning agents developed specifically for removing leaded dust have also been found to be effective (possibly more effective than TSP) in limited trials by several

Pressure gauge

Figure 14.1b Pressure Gauge Indicator Shows When Filters Require Changing.

Figure 14.2 HEPA Vacuum Sizes and Tools.

investigators (Grawe, 1993; Wilson, 1993) and may also be safer, since TSP is a skin and eye irritant. See section VII for more information on non-TSP detergents. Proper procedures for using high-phosphate detergents also apply to most other types of detergents and include the following steps:

### Manufacturer's Dilution Instructions

Users of cleaning agents for leaded dust removal should follow manufacturer's instructions for the proper use of a product, especially the recommended dilution ratio. Even diluted, trisodium phosphate is a skin irritant and users should wear waterproof gloves. Eye protection should also be worn, and portable eyewash facilities should be located in or very near the work area. Consult manufacturer's directions for the use of other detergents.

### Appropriate Cleaning Equipment

Because a detergent may be used to clean leaded dust from a variety of surfaces, several types of application equipment are needed, including cleaning solution spray bottles, wringer buckets, mops, variously sized hand sponges, brushes, and rags. Using the proper equipment on each surface is essential to the quality of the wetwash process.

### Proper Wet-Cleaning Procedures

At the conclusion of the active lead hazard control process and the initial HEPA vacuuming, all vacuumed surfaces should be thoroughly and completely washed with a high-phosphate solution or other lead-specific cleaning agent (or equivalent) and rinsed. Select a detergent that does not damage existing surface finishes (TSP may damage some finishes). Work should proceed from ceilings to floors and sequenced to avoid passing through rooms already cleaned.

### Changing Cleaning Mixture

Many manufacturers of cleaners will indicate the surface area that their cleaning mixture will cover. To avoid recontaminating an area by cleaning it with dirty water, users should follow manufacturer-specified surface-area limits. However, regardless of manufacturers' recommendations, the cleaning mixture should be changed after its use for each room. As a rule of thumb, 5 gallons should be used to clean no

Figure 14.3 Goggles, Face Shields, Gloves, and Eye Wash Facilities Should Be Available When Used With Chemicals Such as TSP. EMERGENCY EYE WASH STATION Latex Neoprene Nitrile

more than 1,000 square feet. Used cleaning mixture is potentially hazardous waste (see Chapter 10); consult with your local water and sewage utility for directions on its proper disposal. Wash water should never be poured onto the ground. The wash water is usually filtered and then poured down a toilet (if the local water authority approves).

### 3. The HEPA/Wet Wash/HEPA Cycle

### Typical Procedures

The usual cleaning cycle that follows lead hazard control activities is called the HEPA vacuum/wet wash/HEPA cycle and is applied to an entire affected area as follows:

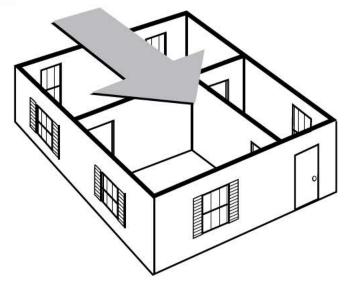

First, the area is HEPA vacuumed.

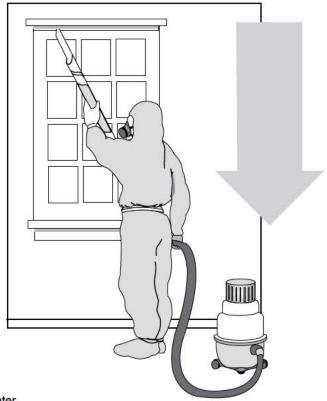

Figure 14.4a The HEPA Vacuum, Wet Wash, HEPA Vacuum Cycle Helps in Meeting Clearance Standards.

### **HEPA** vacuum all surfaces Start at the end farthest from the main entrance/exit. As you vacuum, move towards the main exit and finish there.

Begin at the top of each room and work down. For example, start with the top shelves, the top of the woodwork, and so on, and work down to the floor. Do every inch of the windows, especially the window troughs.

Courtesy: Alice Hamilton Occupational Health Center

- Next, the area is washed down.
- After drying, the area is again HEPA vacuumed.

The rationale for this three-pass system is as follows:

- The first HEPA vacuum removes as much dust and remaining debris as possible.
- The wet wash further dislodges dust from surfaces.
- The final HEPA cycle removes any remaining particles dislodged but not removed by the wet wash.

### Single-Pass Wet Wash/HEPA Vacuum

Some lead hazard control contractors have found HEPA spray cleaner vacuums to be a cost-effective alternative to the three-pass system. Similar to home carpet-cleaning machines, these vacuums simultaneously deliver a solution to the surface and recover the dirty solution. Theoretically, this process combines two of the steps in the HEPA vacuum/wet wash/HEPA cycle into one step. While anecdotal evidence indicates that the spray cleaner wet wash/HEPA is effective for some uses, limitations have been noted in its use for ceilings, vertical surfaces, and hard to reach areas. This device may be used as long as clearance standards are met.

### Figure 14.4b (continued)

### Use special attachments

Use the rubber cone where the floor meets the baseboard and along all the cracks in the floor boards. Use the brush tool for walls and woodwork.

Use the wheeled floor nozzle for bare floors and the carpet beater for rugs.

### Move slowly

Vacuum slowly so the HEPA vacuum can pick up all the lead dust.

**Rubber Cone** 

**Dust Brush** 

**Powered Carpet Beater** 

Wheeled Floor Nozzle

Figure 14.4c (continued)

### Wash all surfaces with suitable detergents

Wash all surfaces in the work area with suitable detergents, including areas that had been covered with plastic. Some wallpaper should only be HEPA vacuumed, since it may be damaged by the detergent.

**Wipe All Surfaces** 

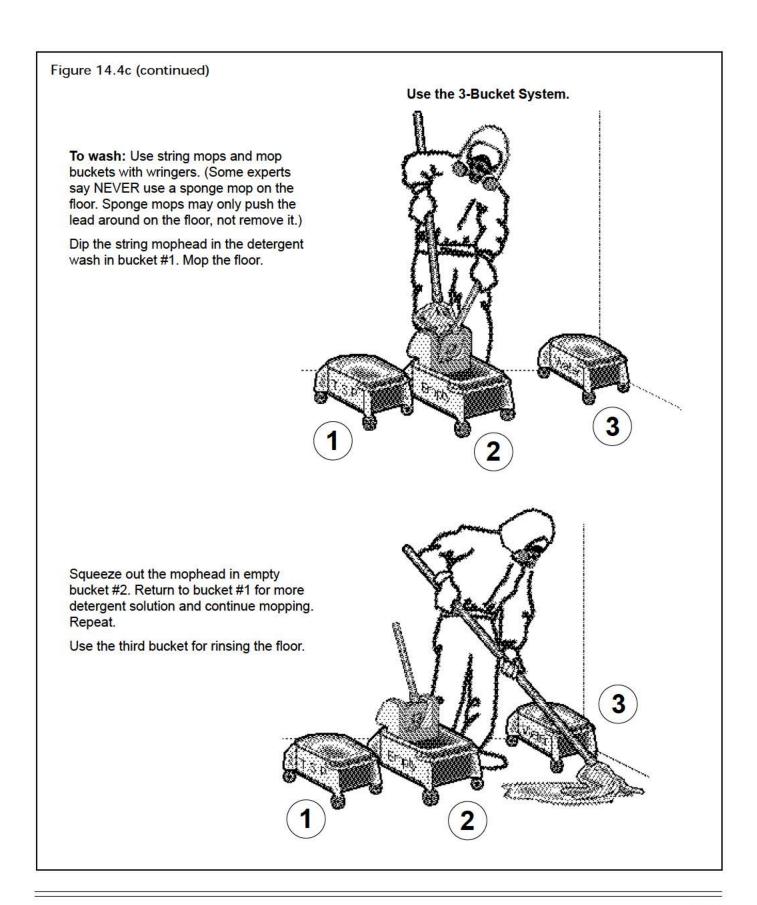

**Wet Mop Floor** 

**Don't Dry Sweep** 

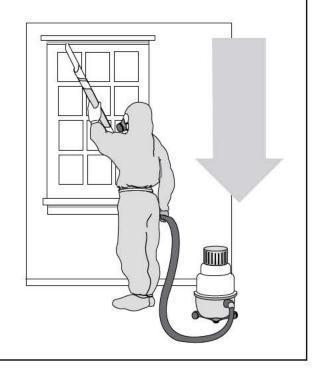

### Figure 14.4d (continued)

**HEPA vacuum all surfaces a final time** HEPA vacuum *all surfaces* in the work area, including areas that had been covered with plastic.

Starting at the far end, work towards the decontamination area. Begin with ceilings or the top of the walls and work down, cleaning the floors last. Do every inch of the windows, especially the troughs. Use the corner tool to clean where the floor meets the baseboard and all the cracks in the floor boards. Use the brush tool for the walls. Move slowly and carefully to get all the dust.

### 4. Sealing Floors

Before clearance, all floors without an intact, nonporous coating should be coated. Sealed surfaces are easier for residents to clean and maintain over time than those that are not sealed. Wooden floors should be sealed with a clear polyurethane or painted with deck enamel or durable paint. Vinyl tile, linoleum, and other similar floors should be sealed with an appropriate wax. Concrete floors should be sealed with a concrete sealer or other type of concrete deck enamel. However, if these floors are already covered by an effective coat of sealant, it may be possible to skip this step.

As an alternative to sealing, floors may be covered with new vinyl tile, sheet vinyl, linoleum flooring, or the equivalent to create a more permanent cleanable surface. New surfaces should be cleaned with a cleaning solution that is appropriate for that type of surface.

### IV. Order of Cleaning Procedures During Lead Hazard Control

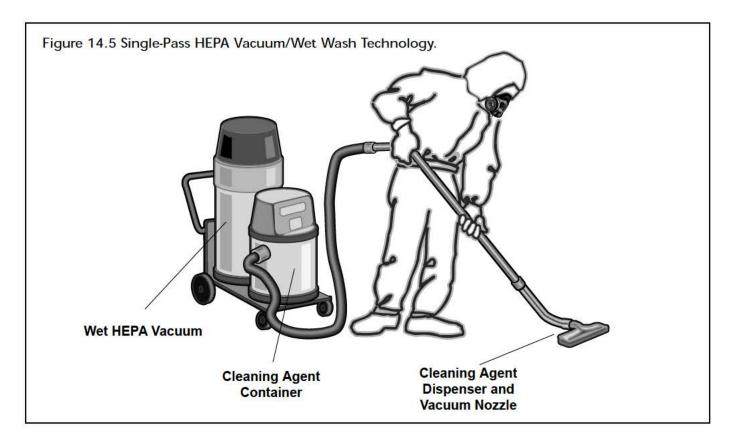

The special cleaning procedures to be followed during a lead-based paint hazard control project are discussed in chronological order below. Skipping steps in the process may result in failure to meet post-lead hazard control clearance standards.

### A. Precleaning Procedures

Precleaning (i.e., cleaning conducted before lead hazard control is begun) is necessary only in dwelling units that are heavily contaminated with paint chips. Precleaning involves the removal of large debris and paint chips, followed by HEPA vacuuming. These steps may be followed by removal of occupant personal possessions, furniture, or carpeting, depending on the

Worksite Preparation Level selected (see Chapter 8). If the furniture will not be cleaned, it should be removed from the area or covered with plastic prior to beginning the precleaning procedure. Carpeting should always be misted before its removal to control the generation of hazardous dust.

It is usually the resident's responsibility to remove most of his or her personal possessions. However, if necessary, owners or project management should be prepared to complete this activity before lead hazard control work begins. As a last resort, the contractor may pack any remaining belongings and carefully seal and move the boxes, supplying all necessary boxes, packing materials, and staff to complete the task. Following cleaning and clearance, the contractor should return all packed items to their appropriate places. Leaving these tasks to the contractor may be expensive and inefficient, since the contractor will need to be insured for this function if the occupant's

Figure 14.6 Precleaning Is Needed in Areas Where Contamination and Deterioration Are High.

belongings are damaged. Additionally, moving furniture, rugs, drapes, and other items owned by the occupant could increase leaded dust levels. Clearance should be conducted after cleaning but before resident items are moved back in.

### B. Ongoing Cleaning During the Job

Periodic HEPA vacuuming during the lead hazard control work may be necessary to minimize tracking of dust and paint chips from one area to another (e.g., when a large amount of paint chips or dust is being generated).

### C. Daily Cleaning Procedures

Cleaning activity should be scheduled at the end of each workday when all active lead hazard control throughout the dwelling has ceased. Sufficient time must be allowed for a thorough and complete cleaning (usually about 30 minutes to an hour). Daily cleaning helps achieve clearance dust levels by minimizing problems that may otherwise occur during final cleaning and limiting worker exposures. While daily cleaning can be skipped in vacant dwelling units, it is required when occupants will

Figure 14.7 Plastic Sheeting Should Be Repaired as Part of Daily Cleanup.

return in the evening. Under no circumstances should debris or plastic be left outside overnight in an unsecured area, even if the dwelling is vacant. Daily cleaning should consist of:

- Removing large debris.
- Removing small debris.
- ♦ HEPA vacuuming, wet clean, HEPA vacuuming (horizontal surfaces only).
- Cleaning exterior.
- Patching and repairing plastic sheeting.
- Securing debris/plastic.

### 1. Large Debris

Large demolition-type debris (e.g., doors, windows, trim) should be wrapped in 6-mil plastic, sealed with tape, and moved to a secure area on the property designated for waste storage. All sharp corners, edges, and nails should be hammered down to prevent injury and minimize the tearing of plastic. It is not necessary to wrap each individual piece of debris in plastic if the entire load can be wrapped. A secure area either outside or inside the property must be designated as a temporary waste-storage area. Covered, secured, and labeled dumpsters placed on or near the property may be used. Proper segregation of waste should be enforced at this time (see Chapter 10).

### 2. Small Debris

After being misted with water, small debris should be swept up, collected, and disposed of properly. The swept debris should be placed in double 4-mil or single 6-mil polyethylene (or equivalent) plastic bags, properly sealed, and moved to the designated trash storage area. Trash bags should not be overloaded; overloaded bags may rupture or puncture during handling and transport.

### 3. Exterior Cleaning

Areas potentially affected by exterior lead hazard control should be protected via a containment system (see Chapter 8). Because weather can adversely affect the efficacy of exterior

containment, the surface plastic of the containment system should be removed at the end of each workday. On a daily basis, as well as during final cleaning, the immediate area should be examined visually to ensure that no debris has escaped containment. Any such debris should be raked or vacuumed and placed in single 6-mil or double 4-mil plastic bags, which should then be sealed and stored along with other contaminated debris. HEPA vacuuming is appropriate for hard exterior surfaces, not soil.

### 4. Worker Protection Measures

General worker protection measures are discussed in Chapter 9. Studies indicate that during daily cleaning activities, especially while wet sweeping, workers may be exposed to high levels of airborne dust. Therefore, workers should wear protective clothing and equipment, especially appropriate respirators.

### 5. Maintaining Containment

The integrity of the plastic sheeting used in a lead hazard control project must be maintained. During their daily cleaning activities, workers should monitor the sheeting and immediately repair any holes or rips with 6-mil plastic and duct tape.

### V. Order of Final Cleaning Procedures After Lead Hazard Control

Before treated surfaces can be painted or sealed, final cleaning procedures must be completed. Because airborne dust requires time to settle, the final cleaning process should start no sooner than 1 hour after active lead hazard control has ceased in the room. See Appendix 11 for details regarding dust settling.

### A. Final Cleaning

As the first stage in the final cleaning, floor plastic should be misted and swept as detailed earlier in this chapter. Upper-level plastic, such as that on cabinets and counters, should be removed first, after it has been misted with water and cleaned. All plastic should be folded

carefully from the corners/ends to the middle to trap any remaining dust. Next, remove both layers of plastic from the floor.

Plastic sheets used to isolate contaminated rooms from noncontaminated rooms should remain in place until after the cleaning and removal of other plastic sheeting; these sheets may then be misted, cleaned, and removed last.

Removed plastic should be placed into double 4-mil or single 6-mil plastic bags, or plastic bags with equivalent (or better) performance characteristics, which are sealed and removed from the premises. As with daily cleanings, this plastic-removal process usually requires workers to use protective clothing and respirators.

After the plastic has been removed from the contaminated area, the entire area should be cleaned using the HEPA/wet wash/HEPA cycle, starting with the ceiling and working down to the floor. After surfaces are repainted or sealed, a final HEPA/wet wash/HEPA cycle may be necessary if accumulated dust caused by other work is visible.

# 1. Decontamination of Workers, Supplies, and Equipment

Decontamination is necessary to ensure that worker's families, other workers, and subsequent properties do not become contaminated. Specific procedures for proper decontamination of equipment, tools, and materials prior to their removal from lead hazard control containment areas should be implemented, as described below and in Chapters 9 and 10.

Work clothing, work shoes, and tools should not be placed in a worker's automobile unless they have been laundered or placed in sealed bags. All vacuums and tools that were used should be wiped down using sponges or rags with detergent solutions.

Consumable/disposable supplies, such as mop heads, sponges, and rags, should be replaced, after each dwelling is completed. Soiled items should be treated as contaminated debris (see Chapter 10).

Figure 14.8a Pick Up Corners of Plastic Sheeting.

Figure 14.8b Fold Plastic Inward.

Durable equipment, such as power and hand tools, generators, and vehicles, should be cleaned prior to their removal from the site; the cleaning should consist of a thorough HEPA vacuuming followed by washing.

### B. Preliminary Visual Examination

After the preliminary final cleaning effort is completed, the certified supervisor should visually evaluate the entire work area to ensure that all work has been completed and all visible dust and debris have been removed. While the preliminary examination may be performed by the lead hazard control supervisor, contractor, or owner as a preparatory step before the final clearance examination, it does not replace the independent visual assessment conducted during clearance.

If the visual examination results are unsatisfactory, affected surfaces must be retreated and/or recleaned. Therefore, it is more cost effective to have the supervisor rather than the clearance examiner perform this initial examination.

# C. Surface Painting or Sealing of Nonfloor Surfaces

The next step of the cleaning process is painting or otherwise sealing all treated surfaces except floors.

Surfaces, including walls, ceilings, and woodwork, should be coated with an appropriate primer and repainted. Surfaces enclosed with vinyl, aluminum coil stock, and other materials traditionally not repainted are exempt from the painting provision.

### D. Final Inspection

The final clearance evaluation should take place at least 1 hour after the final cleaning. Clearance has three purposes: 1) to ensure that the lead hazard control work is complete, 2) to detect the presence of leaded dust, and 3) to make sure that all treated surfaces have been repainted or otherwise sealed. Clearance is usually performed after the sealant is applied to the floor. See Chapter 15 for information on clearance examination procedures.

# E. Recleaning After Clearance Failure

If after passing the final visual examination, the dwelling unit fails the clearance wipe dust tests,

the HEPA/wet wash/HEPA cleaning cycle should be carefully and methodically repeated. Failure is an indication that the cleaning has not been successful. Recleaning should be conducted under the direct supervision of a certified supervisor. Care should be exercised during the recleaning of "failed" surfaces or components to avoid recontaminating "cleared" surfaces or components.

### VI. Cleaning Cost Considerations

An important consideration in determining lead hazard control strategies and methods is the cost and difficulty of required daily and final cleanup operations and the ease with which one can meet dust-clearance standards. A general rule of thumb is that lead hazard control strategies that generate the most dust will have higher cleanup costs and higher initial clearance test-failure rates.

# A. Initial Clearance Test Failure Rates

The likelihood of passing final dust-clearance tests is highly correlated with the chosen intervention strategy, methods, and care exercised by the contractor. For example, in one study (HUD, 1991) initial wipe-test failure rates were 14 percent for interior window sills, 19 percent for floors, and 33 percent for window troughs. The pass/fail rates for each surface were strongly associated with the dwelling unit abatement strategy employed. Chemical removal and hand-scraping strategies experi-enced higher failure rates than replacement and encapsulation/enclosure strategies (see Table 14.1).

However, results of the HUD demonstration project indicated that clearance failure is not solely related to abatement method. The report stated that "the diligence and effectiveness of an abatement contractor's cleaning process ... had a major impact on ... the likelihood of the dwelling unit to pass the final wipe test clearance" (HUD, 1991).

Figure 14.8c Dispose of Plastic Sheeting in a Plastic Trash Bag.

# B. Key Factors In Effective Cleaning

Effective cleaning will be aided by adequate sealing of surfaces with polyethylene sheeting prior to lead hazard control, proper daily cleaning practices, good worker training, and attention to detail. Where poor worksite preparation is employed, additional cleaning may be required to meet clearance.

### C. Special Problems

Surfaces such as porous concrete, old porous hardwood floors, and areas such as corners of rooms and window troughs pose especially difficult cleaning challenges. Porous concrete and corners of rooms normally require additional vacuuming to achieve an acceptable level of cleanliness.

The lead hazard control strategy of enclosure is frequently chosen for window troughs and for old porous hardwood floors due to the difficulty of adequately cleaning these surfaces. This

option provides not only a clean surface but a more permanently cleanable surface for dwelling occupants to maintain.

### VII. Alternative Methods

Alternatives to the recommended cleaning tools and practices discussed in this chapter are available, some having significant potential for increasing effectiveness and lowering costs.

A recent Canadian study (CMHC, 1992) evaluated the effectiveness of contaminated dust cleanup activities using tools that would generally be available to construction contractors and homeowners. Vinyl flooring and carpeting were cleaned using several wet/dry vacuuming systems, sweeping, and wet mopping. The study found that regular vacuums with empty bags send a steady stream of fine particles into the air, while vacuums with partially filled bags were more efficient. This finding suggests the necessity for HEPA vacuums. Other vacuums may be used if workers do not experience increased exposures, if compliance with clearance standards is achieved, and if a variance from OSHA regulation (29 CFR 1926.62 (h)(4)) is obtained by the contractor or employer (if required).

Agitator heads on vacuums were demonstrated to significantly enhance vacuum effectiveness on carpets in cleaning up fine dust without

increasing airborne dust levels. Table 14.2 suggests that a central vacuum with an agitator head is most efficient at removing dust and minimizing recontamination, probably because the vacuum exhaust is blown away from living areas. Because many houses do not have central vacuuming systems, a portable HEPA vacuum is the next best choice (see Table 14.2). Vacuums without agitator heads appeared to perform relatively poorly on carpets.

### A. Vacuums

Regular (non-HEPA) dry vacuums potentially produce hazardous levels of airborne dust and therefore should be avoided. Externally exhausted vacuum units with adequate dustretaining capability may be used. The OSHA lead standard requires the use of HEPA vacuum equipment (see 29 CFR 1926.62 (h)(4), which states, "where vacuuming methods are selected, the vacuums shall be equipped with HEPA filters").

### B. Trisodium Phosphate and Other Detergents

TSP detergents have been used successfully for a number of years in lead hazard control work. However, in recent years, other new cleaning agents have been developed specifically for leaded dust removal. The need for alternatives has been fueled by the fact that TSP is an eye

Table 14.1 Initial Cleaning Wipe-Test Failure Rates for Various Abatement Strategies

| Dust Test<br>Location | Hand Scrape<br>w/Heat Gun | Chemical<br>Removal | Enclosure | Encapsulation | Replacement | All Methods |
|-----------------------|---------------------------|---------------------|-----------|---------------|-------------|-------------|
| Floors                | 28.8%                     | 22.7%               | 20.0%     | 13.8%         | 12.5%       | 19%         |
| Sills                 | 24.4%                     | 24.1%               | 8.2%      | 4.8%          | 17.4%       | 14%         |
| Wells                 | 44.5%                     | 45.7%               | 23.7%     | 25.7%         | 21.0%       | 33%         |

Source: U.S. Department of Housing and Urban Development (August 1991) The HUD Lead-Based Paint Abatement Demonstration (FHA)

and skin irritant and is increasingly restricted from household use and unavailable in many local jurisdictions. TSP also damages some finishes. Recently reported trials of two new products suggest that alternative lead-specific cleaning agents may be more effective and safer than TSP (Grawe, 1993; Wilson, 1993).

These Guidelines do not prohibit the use of non-TSP cleaning agents. HUD encourages further evaluation of alternative cleaning methods. Use of any cleaning agent that results in compliance with clearance criteria is encouraged.

# ARMY FACILITIES MANAGEMENT INFORMATION DOCUMENT ON MOLD REMEDIATION ISSUES

# Moisture Control: The Army Way to Mold Prevention!

### INTRODUCTION

Concern about indoor exposure to mold has been increasing as the public becomes more aware that exposure to mold can cause a variety of health effects and symptoms, including allergic reactions.

This document provides the best and most current guidance for remediation of clean water damage (<48 hours) and mold contamination (>48 hours) into one resourceful Army guide. This guide has been designed to provide information to facilities management individuals who have little or no experience with mold remediation. It will assist them in making a reasonable judgment as to whether the situation can be handled in-house. It will help those in charge of maintenance to develop or evaluate an in-house remediation plan or evaluate a remediation plan submitted by an outside contractor. If an outside contractor is employed, they must have experience cleaning up mold. Check their references, and have them follow the recommendations presented in this document, EPA guidelines, and/or guidelines of the American Conference of Governmental Industrial Hygienists (ACGIH). A multi-disciplinary team approach to mold concerns is best. A health and safety professional, such as an industrial hygienist, should be consulted prior to any remediation activities to assist in the project.

Molds produce tiny spores to reproduce. Mold spores float through the indoor and outdoor air continually. When mold spores land on a damp spot, they may begin growing and digesting whatever they are growing on in order to survive. There are molds that can grow on wood, paper, carpet, and foods. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or uncorrected. There is no practical way to eliminate all molds and mold spores in the indoor environment; the way to control indoor mold growth is to control moisture.(1)

In all situations, the underlying cause of water accumulation must be rectified or mold growth will recur. Any initial water infiltration should be stopped and clean up began immediately. An immediate response (within 24 to 48 hours) and thorough clean up, drying, and/or removal of water damaged materials will prevent or limit mold growth. (Refer to Appendix A for detailed guidance on clean water damage response). If the source of water is elevated humidity, actions to maintain the relative humidity levels below 60% to inhibit mold growth should be taken (2). Emphasis should be on ensuring proper repairs of the building infrastructure, so that water damage and moisture buildup does not recur.

### **MOLD PREVENTION TIPS:**

# [Adapted from EPA, reference 1]

- Fix leaky plumbing and leaks in the building envelope as soon as possible.
- Watch for condensation and wet spots. Fix source(s) of moisture problem(s) as soon as possible.
- Prevent moisture due to condensation by increasing surface temperature or reducing the moisture level in air (humidity). To increase surface temperature, insulate or increase air circulation. To reduce the moisture level in air, repair leaks, increase ventilation (if outside air is cold and dry), or dehumidify (if outdoor air is warm and humid).
- Keep heating, ventilating, and air-conditioning (HVAC) drip pans clean, flowing properly, and unobstructed.
- Vent moisture-generating appliances, such as dryers, to the outside.
- Maintain low indoor humidity, below 60% relative humidity (RH), ideally 30-50%, if possible.
- Perform regular building/HVAC inspections and maintenance as scheduled.
- Clean and dry wet or damp spots within 48 hours.
- Don't let foundations stay wet. Provide adequate drainage and slope the ground away from the foundation.

### REMEDIATION PLANNING

- Plan to dry wet, non-moldy materials within 48 hours to prevent mold growth (Appendix A)
- Select cleanup methods for moldy items (Appendix B)
- Select Personal Protection Equipment (PPE)- protect remediators (Appendix B)
- Select containment equipment protect building occupants (Appendix B)
- Select remediation personnel who have the experience and training needed to implement the remediation plan and use PPE and containment as appropriate

# REMEDIATE MOISTURE AND MOLD PROBLEMS

- Fix moisture problem, implement repair plan and/or maintenance plan
- Dry wet, non-moldy materials within 48 hours to prevent mold growth (Appendix A)
- Clean and dry moldy materials (Appendix B)
- Discard moldy porous items that can't be cleaned (Appendix B)

### REMEDIATION PROCEDURES

Four levels of abatement are described below. The size of the area impacted by mold contamination primarily determines the type of remediation. The sizing levels below are based on professional judgment and practicality; currently there is not adequate data to relate the extent of contamination to frequency or severity of health effects. The goal of remediation is to remove or clean contaminated materials in a way that prevents the emission of mold and preventing dust contaminated with mold from leaving a work area and entering an occupied or non-abatement area, while protecting the health of workers performing the abatement. The listed remediation methods were designed to achieve this goal, however, due to the general nature of these methods it is the responsibility of the people conducting remediation to ensure the methods enacted are adequate. (3)

Non-porous (e.g., metals, glass, and hard plastics) and semi-porous (e.g., wood, and concrete) materials that are structurally sound and are visibly moldy can be cleaned and reused. Cleaning should be done using a detergent solution. Porous materials such as ceiling tiles and insulation, and wallboards with more than a small area of contamination should be removed and discarded. Porous materials (e.g., wallboard, and fabrics) that can be cleaned, can be reused, but should be discarded if possible. All materials to be reused should be dry and visibly free from mold. Routine inspections should be conducted to confirm the effectiveness of remediation work. (1 and 3)

The use of bleach or other biocides is questionable in most cases (8). The effectiveness of bleach in reducing living mold is dependent on concentration, residual chlorine levels, and contact time on the surface (8). All of these factors are difficult to control during remediation. Removal of all mold growth can generally be accomplished by physical removal of materials supporting active growth and thorough cleaning of non-porous materials (4). Therefore, application of a biocide serves no purpose that could not be accomplished with a detergent or cleaning agent (4).

The use of gaseous ozone or chlorine dioxide for remedial purposes is **not** recommended. Both compounds are highly toxic and contamination of occupied space may pose a health threat. Furthermore, the effectiveness of these treatments is unproven. For additional information on the use of biocides for remedial purposes, refer to the American Conference of Governmental Industrial Hygienists' document, "Bioaerosols: Assessment and Control."(4)

### FOUR REMEDIATION LEVELS

[Adapted from NYCDOH Guidelines on Assessment and Remediation of Fungi in Indoor Environments (3) and EPA (1)]

**Level I:** Small Isolated Areas – Total surface area affected less than 10 square **feet** - e.g., ceiling tiles, small areas on walls. Refer to Appendix B for detailed guidance.

BEST AVAILABLE COPY

Feb 02

Regular building maintenance staff can conduct this level of remediation. Such persons should receive training on proper clean up methods, personal protection,

and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).

See Appendix C for PPE guidance. Respiratory protection (e.g., N95 disposable respirator), used in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended(7). Gloves and goggles should be worn. All individuals must be trained, have medical clearance, and must be fit-tested by a trained professional before wearing a respirator.

The work area should be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons recovering from recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity pneumonitis, and severe allergies).

Containment of the work area is not necessary. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.

Contaminated materials that cannot be cleaned should be sealed and double-bagged in 6-mil plastic bags and removed. Since there are no special disposal requirements for moldy materials, they can be discarded as ordinary construction waste.

The work area and areas used by remediation workers for egress should be cleaned with a damp cloth and/or mop and a detergent solution.

All areas should be left dry and visibly free from contamination and debris.

Level II: Medium – Total Surface Area affected between 10 and 100 square feet - e.g., several wallboard panels. (See Appendix B for detailed guidance).

The following procedures at a minimum are recommended:

Refer to Appendix C for proper PPE selection. Limited or Full protection may be required depending on the situation.

Refer to Appendix D for Containment procedures.

The work area and areas directly adjacent should be covered with a single layer of 6 mil fire-retardant polyethylene sheet(s) and taped before remediation, to contain dust/debris.

TG 277

Seal ventilation ducts/grills in the work area and areas directly adjacent with 6 mil polyethylene sheeting. Use an exhaust fan with a High Efficiency Particulate Air (HEPA) filter to generate negative pressurization.

The work area and areas directly adjacent should be unoccupied. Further vacating of people from spaces near the work area is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity pneumonitis, and severe allergies).

Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.

Contaminated materials that cannot be cleaned should be sealed and double-bagged in 6-mil plastic bags and removed. Since there are no special disposal requirements for moldy materials, they can be discarded as ordinary construction waste.

The work area and surrounding areas should be HEPA vacuumed (a vacuum equipped with a High-Efficiency Particulate Air filter) and cleaned with a damp cloth and/or mop and a detergent solution.

All areas should be left dry and visibly free from contamination and debris.

If abatement procedures are expected to generate a lot of dust (e.g., abrasive cleaning of contaminated surfaces, demolition of plaster walls) or the visible concentration of the mold is heavy (blanket coverage as opposed to patchy), then it is recommended that the remediation procedures for Level III be followed.

Level III: Large Area – Total Surface Area affected greater than 100 square feet or potential for increased occupant or remediator exposure during remediation is estimated to be significant. (See Appendix B for detailed guidance).

The following procedures are recommended:

Refer to Appendices C & D for PPE and Containment guidance.

Completely isolate the work area from occupied spaces using double layers of polyethylene plastic sheeting sealed with duct tape (including ventilation ducts/grills, fixtures, and any other openings).

Utilize an exhaust fan with a HEPA filter to generate negative pressurization. Provide airlocks and a decontamination room.

TG 277 EST AVAILABLE COPY
Feb 02

The work area and areas directly adjacent should be unoccupied. Further vacating of people from spaces near the work area is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity pneumonitis, and severe allergies).

Contaminated materials that cannot be cleaned should be sealed and double-bagged in 6-mil plastic bags and removed. Since there are no special disposal requirements for moldy materials, they can be discarded as ordinary construction waste. The outside of the bags should be cleaned with a damp cloth and a detergent solution or HEPA vacuumed in the decontamination chamber prior to their transport to uncontaminated areas of the building.

The contained area and decontamination room should be HEPA vacuumed and cleaned with a damp cloth and/or mop with a detergent solution and be visibly clean prior to the removal of isolation barriers.

Pre- and post-remediation sampling may also be useful in determining whether remediation efforts have been effective. After remediation, the types and concentrations of mold in the indoor air samples should be similar to what is found in the local outdoor air(4). Since no Federal limits have been set for mold or mold spores, sampling cannot be used to check a building's compliance with Federal mold standards.

If any remediation sampling is deemed necessary contact your local industrial hygiene office or contact safety and health professionals with specific experience in designing mold sampling protocols, sampling methods, and interpretation of results. Sample analysis should follow analytical methods recommended by the American Industrial Hygiene Association (AIHA) or the American Conference of Governmental Industrial Hygienists (ACGIH). The laboratory conducting the analyses should participate in the AIHA Environmental Microbiology Proficiency Analytical Testing (EMPAT) program.

**Level IV: Remediation of HVAC Systems** (See Appendix B for detailed guidance. For a small area (<10 ft²) follow Level I guidance for PPE and containment and for a areas (>10 ft²) follow Medium (Level II) or when greater than 100 ft² follow Large (Level III) guidance for PPE and containment as discussed in Appendices B, C, and D)

A Small Isolated Area of Contamination (total surface area affected <10 square feet) in the HVAC System

The HVAC system should be shut down prior to any remedial activities.

Regular building maintenance staff can conduct this level of remediation. Such persons should receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).

See Appendix C for PPE guidance. Respiratory protection (e.g., N95 disposable respirator), used in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended (7). Gloves and goggles should be worn. All individuals must be trained, have medical clearance, and must be fit-tested by a trained professional.

The work area should be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons recovering from recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity pneumonitis, and severe allergies).

Containment of the work area is not necessary. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.

Growth supporting materials that are contaminated, such as the insulation of interior lined ducts and filters, should be removed. Other contaminated materials that cannot be cleaned should be sealed and double-bagged in 6-mil plastic bags and removed. Since there are no special disposal requirements for moldy materials, they can be discarded as ordinary construction waste.

The work area and areas immediately surrounding the work area should be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution.

All areas should be left dry and visibly free from contamination and debris.

# Areas of Contamination (Total surface area affected >10 square feet) in the HVAC System

The following procedures are recommended:

The HVAC system should be shut down prior to any remedial activities.

Refer to Appendices C & D for PPE and Containment guidance.

Completely isolate the work area from other areas. Isolate the HVAC system using double layers of polyethylene plastic sheeting sealed with duct tape (including ventilation ducts/grills, fixtures, and any other openings).

TG 277

TG 277 Feb 02

Utilize an exhaust fan with a HEPA filter to generate negative pressurization. Provide airlocks and a decontamination room.

Growth supporting materials that are contaminated, such as the insulation of interior lined ducts and filters, should be removed. Other contaminated materials that cannot be cleaned should be sealed and removed in double-bagged 6-mil plastic. When a decontamination room is present, the outside of the bags should be cleaned with a damp cloth and a detergent solution or HEPA vacuumed prior to their transport to uncontaminated areas of the building. Since there are no special disposal requirements for moldy materials, they can be discarded as ordinary construction waste.

The contained area and decontamination room should be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution prior to the removal of isolation barriers.

All areas should be left dry and visibly free from contamination and debris.

Pre- and post-remediation sampling may also be useful in determining whether remediation efforts have been effective. After remediation, the types and concentrations of mold in the indoor air samples should be similar to what is found in the local outdoor air (4). Since no Federal limits have been set for mold or mold spores, sampling cannot be used to check a building's compliance with Federal mold standards.

If remediation sampling is necessary contact your local industrial hygiene office or contact safety and health professionals with specific experience in designing mold sampling protocols, sampling methods, and interpretation of results. Sample analysis should follow analytical methods recommended by the American Industrial Hygiene Association (AIHA) or the American Conference of Governmental Industrial Hygienists (ACGIH).

# HAZARD COMMUNICATION

When mold growth requiring Level III or IV (large-scale) remediation is found, the building owner, management, and/or employer should notify occupants in the affected area(s) of its presence. Notification should include a description of the remedial measures to be taken and a timetable for completion. Well-planned group meetings held before and after remediation with full disclosure of plans and results can be an effective communication mechanism. Individuals seeking medical attention should be provided with a copy of all inspection results and interpretation to give to their medical practitioners (1 and 3).

### **CONCLUSION**

In summary, the prompt remediation of contaminated material and infrastructure repair must be the primary response to mold contamination in buildings. The simplest and most expedient remediation that properly and safely removes mold growth from buildings should be used. Widespread contamination poses much larger problems that must be addressed on a case-by-case basis in consultation with a health and safety specialist. Effective communication with building occupants is an essential component of all remedial efforts. Individuals with persistent health problems should go to the local occupational health clinic or see their physicians for a referral to practitioners who are trained in occupational/environmental medicine or related specialties and are knowledgeable about these types of exposures.

# **Water Damage Cleanup and Mold Prevention**

Appendix A presents strategies to respond to water damage within 24-48 hours. These guidelines are designed to help avoid the need for remediation of mold growth by taking quick action before growth starts. If mold growth is found on the materials listed in Appendix A, refer to Appendix B for guidance on remediation. Depending on the size of the area involved and resources available, professional assistance may be needed to dry an area quickly and thoroughly.

£ If mold growth has occurred or materials have been wet for more than 48 hours, consult Appendix B. Even if materials are dried within 48 hours, mold growth may have occurred. Professionals may test items if there is doubt. Note that mold growth will not always occur after 48 hours; this is only a guideline.

These guidelines are for damage caused by clean water. If you know or suspect that the water source is contaminated with sewage, or chemical or biological pollutants, then OSHA may have requirements for Personal Protective Equipment and containment. An experienced professional should be consulted if you and/or your remediators do not have expertise remediating in contaminated water situations. Do not use fans before determining that the water is clean or sanitary.

- † If a particular item(s) has high monetary or sentimental value, you may wish to consult a restoration/water damage specialist.
- § The subfloor under the carpet or other flooring material must also be cleaned and dried. See the appropriate section of this table for recommended actions depending on the composition of the subfloor.

# APPENDIX B

# [Adapted from EPA 402-K-01-001, March 2001]

# **Mold Remediation Guidelines**

Appendix B presents remediation guidelines for building materials that have or are likely to have mold growth. The guidelines in Appendix B are designed to protect the health of occupants and cleanup personnel during remediation. These guidelines are based on the area and type of material affected by water damage and/or mold growth. Please note that these are guidelines; some professionals may prefer other cleaning methods.

If you are considering cleaning your ducts as part of your remediation plan, you should consult EPA's publication entitled, Should You Have the Air Ducts In Your Home Cleaned? (5) Although this EPA document has a residential focus, the same concept applies to other building types. If possible, remediation activities should be scheduled during off-hours when building occupants are less likely to be affected.

Although the level of personal protection suggested in these guidelines is based on the total surface area contaminated and the potential for remediator and/or occupant exposure, professional judgment should always play a part in remediation decisions. These remediation guidelines are based on the size of the affected area to make it easier for remediators to select appropriate techniques, not on the basis of health effects or research showing there is a specific method appropriate at a certain number of square feet. The guidelines have been designed to help construct a remediation plan. The remediation manager will then use professional judgment and experience to adapt the guidelines to particular situations. When in doubt, caution is advised. Consult an experienced mold remediator for more information.

| Guidelines for Remediating Building Materials with Mold Growth Caused by Clean Water* |                                                                    |                                                 |               |  |  |  |

\*Use professional judgment to determine prudent levels of Personal Protective Equipment and containment for each situation, particularly as the remediation site size increases and the potential for exposure and health effects rises. Assess the need for increased Personal Protective Equipment, if, during the remediation, more extensive contamination is encountered than was expected. Consult Appendix A if materials have been wet for less than 48 hours, and mold growth is not apparent. These guidelines are for damage caused by clean water. If you know or suspect that the water source is contaminated with sewage, or chemical or biological pollutants, then the Occupational Safety and Health Administration (OSHA) requires PPE and containment. An experienced professional should be consulted if you and/or your remediators do not have expertise in remediating contaminated water situations.

†Select method most appropriate to situation. Since molds gradually destroy the things they grow on, if mold growth is not addressed promptly, some items may be damaged such that cleaning will not restore their original appearance. If mold growth is heavy and items are valuable or important, you may wish to consult a restoration/water damage/remediation expert. Please note that these are guidelines; other cleaning methods may be preferred by some professionals.

# **Cleanup Methods**

- Method 1: Wet vacuum (in the case of porous materials, some mold spores/fragments will remain in the material but will not grow if the material is completely dried). Steam cleaning may be an alternative for carpets and some upholstered furniture.
- Method 2: Damp-wipe surfaces with plain water or with water and detergent solution (except wood —use wood floor cleaner); scrub as needed.
- Method 3: High-efficiency particulate air (HEPA) vacuum after the material has been thoroughly dried. Dispose of the contents of the HEPA vacuum in well-sealed plastic bags.
- Method 4: Discard Remove water-damaged materials and seal in plastic bags while inside of containment, if present. Dispose of as normal waste. HEPA vacuum area after it is dried.

# **Personal Protective Equipment (PPE)**

- Minimum: Gloves, N-95 respirator, goggles/eye protection
- Limited: Gloves, N-95 respirator or half-face respirator with HEPA filter, disposable overalls, goggles/eye protection
- Full: Gloves, disposable full body clothing, head gear, foot coverings, full-face respirator with HEPA filter

### **Containment**

- Limited: Use polyethylene-sheeting ceiling to floor around affected area with a slit entry and covering flap; maintain area under negative pressure with HEPA filtered fan unit. Block supply and return air vents within containment area.
- Full: Use two layers of fire-retardant polyethylene sheeting with one airlock chamber. Maintain area under negative pressure with HEPA filtered fan exhausted outside of building. Block supply and return air vents within containment area.

Table developed from literature and remediation documents including Bioaerosols: Assessment and Control (American Conference of Governmental Industrial Hygienists, 1999) (4) and IICRC S500, Standard and Reference Guide for Professional Water Damage Restoration, (Institute of Inspection, Cleaning and Restoration, 1999) (6)

# **APPENDIX C**

[Adapted Source: EPA 402-K-01-001: Mold Remediation in Schools and Commercial Buildings, March 2001]

# PERSONAL PROTECTIVE EQUIPMENT

# **Skin and Eye Protection**

Gloves are required to protect the skin from contact with mold allergens (and in some cases mold toxins) and from potentially irritating cleaning solutions. Long gloves that extend to the middle of the forearm are recommended. The glove material should be selected based on the type of materials being handled. If you are using a strong cleaning solution, you should select gloves made from natural rubber, neoprene, nitrile, polyurethane, or polyvinyl chloride (PVC). If you are using a mild detergent or plain water, ordinary household rubber gloves may be used. To protect your eyes, use properly fitted goggles or a full-face respirator with HEPA filter. Goggles must be designed to prevent the entry of dust and small particles. Safety glasses or goggles with open vent holes are not acceptable.

# **Respiratory Protection**

Respirators protect cleanup workers from inhaling airborne mold, mold spores, and dust. Respiratory protection used in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended(7). All individuals must be trained, have medical clearance, and must be fit-tested by a trained professional before wearing a respirator.

- Minimum: When cleaning up a small area affected by mold, you should use an N-95 respirator. This device covers the nose and mouth, will filter out 95% of the particulates that pass through the filter. In situations where a full-face respirator is in use, additional eye protection is not required.
- Limited: Limited PPE includes use of a half-face or full-face air-purifying respirator (APR) equipped with a HEPA filter cartridge. These respirators filter mold particles in the air. Note that half-face APRs do not provide eye protection. In addition, the HEPA filters do not remove vapors or gases. You should always use respirators approved by the National Institute for Occupational Safety and Health.
- Full: In situations in which high levels of airborne dust or mold spores are likely or when intense or long-term exposures are expected (e.g., the cleanup of large areas of contamination), a full-face, powered air-purifying respirator (PAPR) is recommended. Full-face PAPRs use a blower to force air through a HEPA filter. The HEPA-filtered air is supplied to a mask that covers the entire face or a hood that covers the entire head. The positive pressure within the mask or hood prevents unfiltered air from entering through penetrations or gaps. Individuals must be trained to use their respirators before they begin remediation.

### TG 277 ### Feb 02

# **Disposable Protective Clothing**

Disposable clothing is recommended during a medium or large remediation project to prevent the transfer and spread of mold to clothing and to eliminate skin contact with mold.

- Limited: Disposable paper overalls can be used.
- Full: Mold-impervious disposable head and foot coverings, and a body suit made of a breathable material, such as TYVEK®, should be used. All gaps, such as those around ankles and wrists, should be sealed (many remediators use duct tape to seal clothing).

# APPENDIX D

[Source: EPA 402-K-01-001: Mold Remediation in Schools and Commercial Buildings, March 2001]

# **CONTAINMENT GUIDANCE**

### **Containment**

The purpose of containment during remediation activities is to limit release of mold into the air and surroundings, in order to minimize the exposure of remediators and building occupants to mold. Mold and moldy debris should not be allowed to spread to areas in the building beyond the contaminated site.

The two types of containment recommended in Appendix B are limited and full. The larger the area of moldy material, the greater the possibility of human exposure and the greater the need for containment. In general, the size of the area helps determine the level of containment. However, a heavy growth of mold in a relatively small area could release more spores than a lighter growth of mold in a relatively large area. Choice of containment should be based on professional judgment. The primary object of containment should be to prevent occupant and remediator exposure to mold.

# **Containment Tips**

- Always maintain the containment area under negative pressure.
- Exhaust fans to outdoors and ensure that adequate makeup air is provided.
- If the containment is working, the polyethylene sheeting should billow inwards on all surfaces. If it flutters or billows outward, containment has been lost, and you should find and correct the problem before continuing your remediation activities.

# **Limited Containment**

Limited containment is generally recommended for areas involving between 10 and 100 square feet (ft²) of mold contamination. The enclosure around the moldy area should consist of a single layer of 6-mil, fire-retardant polyethylene sheeting. The containment should have a slit entry and covering flap on the outside of the containment area. For small areas, the polyethylene sheeting can be affixed to floors and ceilings with duct tape. For larger areas, a steel or wooden stud frame can be erected and polyethylene sheeting attached to it. All supply and air vents, doors, chases, and risers within the containment area must be sealed with polyethylene sheeting to minimize the migration of contaminants to other parts of the building. Heavy mold growth on ceiling tiles may impact HVAC systems if the space above

the ceiling is used as a return air plenum. In this case, containment should be installed from the floor to the ceiling deck, and the filters in the air-handling units serving the affected area may have to be replaced once remediation is finished.

The containment area must be maintained under negative pressure relative to surrounding areas. This will ensure that contaminated air does not flow into adjacent areas. This can be done with a HEPA-filtered fan unit exhausted outside of the building. For small, easily contained areas, an exhaust fan ducted to the outdoors can also be used. The surfaces of all objects removed from the containment area should be remediated/cleaned prior to removal. The remediation guidelines outlined in Appendix B can be implemented when the containment is completely sealed and is under negative pressure relative to the surrounding area.

# **Full Containment**

Full containment is recommended for the cleanup of mold-contaminated surface areas greater than 100 ft<sup>2</sup> or in any situation in which it appears likely that the occupant space would be further contaminated without full containment. Double layers of polyethylene should be used to create a barrier between the moldy area and other parts of the building. A decontamination room or airlock should be constructed for entry into and exit from the remediation area. The entryways to the airlock from the outside and from the airlock to the main containment area should consist of a slit entry with covering flaps on the outside surface of each slit entry. The chamber should be large enough to hold a waste container and allow a person to put on and remove PPE. All contaminated PPE, except respirators, should be placed in a sealed bag while in this chamber. Respirators should be worn until remediators are outside the decontamination chamber. PPE must be worn throughout the final stages of HEPA vacuuming and damp-wiping of the contained area. PPE must also be worn during HEPA vacuum filter changes or cleanup of the HEPA vacuum.

# **Industrial Hygiene/Preventive Medicine Mold Assessment Guide**

### Introduction

The USACHPPM Industrial Hygiene Field Services Program receives requests from industrial hygiene (IH)/preventive medicine (PM) field personnel for information about mold investigations and clean-up procedures. Like all organisms, molds have an absolute requirement for water. The types of mold and their abundance in an area depend on the availability of nutrients (i.e., dirt), water and temperature. Chronic water intrusion, lack of adequate ventilation and moisture control, and or isolated floods, such as a water pipe bursting, are typical conditions, which lead to mold growth in buildings.

When mold growth is present, the removal and cleaning of contaminated materials must be handled with proper precautions, because disturbing this growth can result in bioaerosol release, i.e., sending millions of spores into the air.

This mold assessment guide used in conjunction with the *ARMY Facilities Management Information Document on Mold Remediation Issues* (*TG* 277)<sup>1</sup> will assist Industrial Hygienists and or Preventive Medicine personnel in conducting mold investigations. Since a team approach is recommended, the collaboration between IH/PM personnel and facility management personnel is vital to correct moldy conditions and prevent future mold growth. Use the following procedures and refer to Appendix A: Mold Investigation Decision Logic, for guidance on mold investigation, evaluation, and remediation for routine assessments.

Air sampling for mold should never be part of a routine assessment. Remediation strategies can generally be made on the basis of a visual inspection or confirmation with a bulk or surface sample. In addition, air sampling methods for some mold are prone to false negative results and therefore cannot be used to definitively rule out contamination<sup>2</sup>.

# Safety Tips While Investigating and Evaluating Mold and Moisture Problems<sup>3</sup>

- Be careful not to touch mold or moldy items with bare hands.
- Do not allow mold or mold spores to get into your eyes.
- Do not breathe in mold or mold spores.
- Consult **Appendices B, C, and D** for Remediation, Personal Protective Equipment (PPE) to be used during remediation and Containment guidance.
- Consider using PPE when disturbing mold during investigation. Depending upon the situation, a half-face NIOSH-approved N-95 respirator, gloves, and goggles are recommended.

# Communicate with building occupants at all stages of process, as appropriate<sup>1</sup>.

When mold growth requiring Level III or IV (large-scale) remediation is found (See Appendix B), the building owner, management, and/or employer should notify occupants in the affected area(s) of its presence. Notification should include a description of the remedial measures to be taken and a timetable for completion. Well-planned group meetings held before and after remediation with full disclosure of plans and results can be an effective communication mechanism. Individuals seeking medical attention should be provided with a copy of all inspection results and interpretation to give to their medical practitioners.

# Routine Investigation and Evaluation of moisture and mold problems<sup>3</sup>.

- Determine the total surface area of visible mold affected (square feet).
- Consider the possibility of hidden mold.
- Clean up small mold problems and fix moisture problems before they become large problems.
- Select remediation personnel or team based on the assessment.
- Investigate areas associated with occupant complaints.
- Identify source(s) or cause of water or moisture problem(s).
- Note type of water-damaged materials (wallboard, carpet, etc.).
- Check inside air ducts and air handling unit.

# **Assessments Requiring Sampling**

Air sampling may be necessary if an individual(s) has been diagnosed with a disease that is or may be associated with mold exposure (e.g., aspergillosis) and the occupational health physician/medical practitioner desires to confirm the causative agent.

Pre- and post-remediation air sampling may be necessary if there is evidence from a visual inspection or bulk sampling that the ventilation systems are contaminated. The purpose of such sampling is to assess the extent of contamination throughout a building and to confirm adequate remediation.

Air sampling may be necessary if the presence of mold is suspected (e.g., musty odors) but cannot be identified by a visual inspection or bulk sampling (e.g., mold growth behind walls). The purpose of this sampling is to determine the location and degree of contamination<sup>2</sup>.

When air sampling is deemed necessary and is performed, outdoor air samples should be collected at the same time at the fresh air intake, which serves the suspected area. Values obtained should be compared and the indoor and outdoor air samples should be similar in kinds and concentrations of mold to what is found locally in the outdoor air<sup>4</sup>. If they are different, bioamplification is occurring and the problem needs corrected.

Personnel conducting the sampling should be trained in proper air sampling methods for microbial contaminants. For additional information on air sampling, refer to the American Conference of Governmental Industrial Hygienists', "Bioaerosols: Assessment and Control<sup>4</sup>."

Sample analysis should follow analytical methods recommended by the American Industrial Hygiene Association (AIHA) or the American Conference of Governmental Industrial Hygienists (ACGIH). The laboratory conducting the analyses should participate in the AIHA Environmental Microbiology Proficiency Analytical Testing (EMPAT) program. For further mold assistance, contact USACHPPM, Industrial Hygiene Field Services Program, DSN 584-3118 or (410) 436-3118.

# **APPENDIX A**

# **MOLD INVESTIGATION DECISION LOGIC**

# MOLD INVESTIGATION DECISION LOGIC

# MOLD INVESTIGATION DECISION LOGIC NOTES:

- 1. Roughly approximate the total surface area of visible mold. Categorization of the remediation levels are sometimes borderline, so when trying to decide the category to apply, consider the extent of visible growth, such as a heavy blanket of growth on the surface, to barely visible. If heavy growth is apparent, consider moving up to the next level of protection.
- 2. Do not skip this step. Address the source of water or moisture problem or the mold will simply reappear.
- 3. Always protect the health and safety of the building occupants and remediators.
- 4. Mold may be hiding on the backside of drywall, vinyl wallpaper, or paneling, the top of ceiling tiles, the underside of carpets and pads. Check walls behind furniture, pipe chases and utility tunnels, porous thermal or acoustic liners inside ductwork, or check the rafters (due to roof leaks or insufficient insulation)<sup>3</sup>.
- 5. Utilize appendices B and C for remediation guidance. Use your best judgment during investigations, if not disturbing the mold you may need minimal to no PPE. Do not alarm building occupants unnecessarily, but protect yourself as necessary.
- 6. If the containment is working properly, the polyethylene sheeting will billow inwards on all surfaces. If it flutters or billows outward, containment has not been achieved, and you should find and correct the problem before starting your remediation activities<sup>3</sup>. Confirm negative pressure with smoke tubes.
- 7. Select remediation personnel who have the experience and training needed to implement the remediation plan.
- 8. You must completely fix or eliminate the water or moisture problem to solve the problem.
- 9. You should revisit the site(s) approximately two weeks after remediation, and it should show no signs of water damage or mold growth.
- 10. If you discover hidden mold, revise your plan by reassessing the size of moldy area.
- 11. If you believe that you have a hidden mold problem, you may want to consider hiring an experienced mold investigative professional.

# **APPENDIX B**

[Adapted from EPA 402-K-01-001, March 2001]

# **Mold Remediation Guidelines**

Appendix B presents remediation guidelines for building materials that have or are likely to have mold growth. The guidelines in Appendix B are designed to protect the health of occupants and cleanup personnel during remediation. These guidelines are based on the area and type of material affected by water damage and/or mold growth. Please note that these are guidelines; some professionals may prefer other cleaning methods.

If you are considering cleaning your ducts as part of your remediation plan, you should consult EPA's publication entitled, Should You Have the Air Ducts In Your Home Cleaned? (5) Although this EPA document has a residential focus, the same concept applies to other building types. If possible, remediation activities should be scheduled during off-hours when building occupants are less likely to be affected.

Although the level of personal protection suggested in these guidelines is based on the total surface area contaminated and the potential for remediator and/or occupant exposure, professional judgment should always play a part in remediation decisions. These remediation guidelines are based on the size of the affected area to make it easier for remediators to select appropriate techniques, not on the basis of health effects or research showing there is a specific method appropriate at a certain number of square feet. The guidelines have been designed to help construct a remediation plan. The remediation manager will then use professional judgment and experience to adapt the guidelines to particular situations. When in doubt, caution is advised. Consult an experienced mold remediator for more information.

\*Use professional judgment to determine prudent levels of Personal Protective Equipment and containment for each situation, particularly as the remediation site size increases and the potential for exposure and health effects rises. Assess the need for increased Personal Protective Equipment, if, during the remediation, more extensive contamination is encountered than was expected. These guidelines are for damage caused by clean water. If you know or suspect that the water source is contaminated with sewage, or chemical or biological pollutants, then the Occupational Safety and Health Administration (OSHA) requires PPE and containment. An experienced professional should be consulted if you and/or your remediators do not have expertise in remediating contaminated water situations.

†Select method most appropriate to situation. Since molds gradually destroy the things they grow on, if mold growth is not addressed promptly, some items may be damaged such that cleaning will not restore their original appearance. If mold growth is heavy and items are valuable or important, you may wish to consult a restoration/water damage/remediation expert. Please note that these are guidelines; other cleaning methods may be preferred by some professionals.

### **Cleanup Methods**

- Method 1: Wet vacuum (in the case of porous materials, some mold spores/fragments will remain in the material but will not grow if the material is completely dried). Steam cleaning may be an alternative for carpets and some upholstered furniture.
- Method 2: Damp-wipe surfaces with plain water or with water and detergent solution (except wood —use wood floor cleaner); scrub as needed.
- Method 3: High-efficiency particulate air (HEPA) vacuum after the material has been thoroughly dried. Dispose of the contents of the HEPA vacuum in well-sealed plastic bags.
- Method 4: Discard Remove water-damaged materials and seal in plastic bags while inside of containment, if present. Dispose of as normal waste. HEPA vacuum area after it is dried.

### **Personal Protective Equipment (PPE)**

- Minimum: Gloves, N-95 respirator, goggles/eye protection
- Limited: Gloves, N-95 respirator or half-face respirator with HEPA filter, disposable overalls, goggles/eye protection
- Full: Gloves, disposable full body clothing, head gear, foot coverings, full-face respirator with HEPA filter

### Containment

- Limited: Use polyethylene-sheeting ceiling to floor around affected area with a slit entry and covering flap; maintain area under negative pressure with HEPA filtered fan unit. Block supply and return air vents within containment area.
- Full: Use two layers of fire-retardant polyethylene sheeting with one airlock chamber. Maintain area under negative pressure with HEPA filtered fan exhausted outside of building. Block supply and return air vents within containment area.

Table developed from literature and remediation documents including Bioaerosols: Assessment and Control (American Conference of Governmental Industrial Hygienists, 1999) (4) and IICRC S500, Standard and Reference Guide for Professional Water Damage Restoration, (Institute of Inspection, Cleaning and Restoration, 1999) (6)

# APPENDIX C

[Adapted Source: EPA 402-K-01-001: Mold Remediation in Schools and Commercial Buildings, March 2001]

# PERSONAL PROTECTIVE EQUIPMENT

# **Skin and Eye Protection**

Gloves are required to protect the skin from contact with mold allergens (and in some cases mold toxins) and from potentially irritating cleaning solutions. Long gloves that extend to the middle of the forearm are recommended. The glove material should be selected based on the type of materials being handled. If you are using a strong cleaning solution, you should select gloves made from natural rubber, neoprene, nitrile, polyurethane, or polyvinyl chloride (PVC). If you are using a mild detergent or plain water, ordinary household rubber gloves may be used. To protect your eyes, use properly fitted goggles or a full-face respirator with HEPA filter. Goggles must be designed to prevent the entry of dust and small particles. Safety glasses or goggles with open vent holes are not acceptable.

# **Respiratory Protection**

Respirators protect cleanup workers from inhaling airborne mold, mold spores, and dust. Respiratory protection used in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended(7). All individuals must be trained, have medical clearance, and must be fit-tested by a trained professional before wearing a respirator.

- Minimum: When cleaning up a small area affected by mold, you should use an N-95 respirator. This device covers the nose and mouth, will filter out 95% of the particulates that pass through the filter. In situations where a full-face respirator is in use, additional eye protection is not required.
- Limited: Limited PPE includes use of a half-face or full-face air-purifying respirator (APR) equipped with a HEPA filter cartridge. These respirators filter mold particles in the air. Note that half-face APRs do not provide eye protection. In addition, the HEPA filters do not remove vapors or gases. You should always use respirators approved by the National Institute for Occupational Safety and Health.
- Full: In situations in which high levels of airborne dust or mold spores are likely or when intense or long-term exposures are expected (e.g., the cleanup of large areas of contamination), a full-face, powered air-purifying respirator (PAPR) is recommended. Full-face PAPRs use a blower to force air through a HEPA filter. The HEPA-filtered air is supplied to a mask that covers the entire face or a hood that covers the entire head. The positive pressure within the mask or hood prevents unfiltered air from entering through penetrations or gaps. Individuals must be trained to use their respirators before they begin remediation.

# **Disposable Protective Clothing**

Disposable clothing is recommended during a medium or large remediation project to prevent the transfer and spread of mold to clothing and to eliminate skin contact with mold.

- Limited: Disposable paper overalls can be used.
- Full: Mold-impervious disposable head and foot coverings, and a body suit made of a breathable material, such as TYVEK®, should be used. All gaps, such as those around ankles and wrists, should be sealed (many remediators use duct tape to seal clothing).

®TYVEK, DuPont de Nemours, E.I., & Co., Wilmington, DE.

# APPENDIX D

# CONTAINMENT GUIDANCE

### Containment

The purpose of containment during remediation activities is to limit release of mold into the air and surroundings, in order to minimize the exposure of remediators and building occupants to mold. Mold and moldy debris should not be allowed to spread to areas in the building beyond the contaminated site.

The two types of containment recommended in Appendix B are limited and full. The larger the area of moldy material, the greater the possibility of human exposure and the greater the need for containment. In general, the size of the area helps determine the level of containment. However, a heavy growth of mold in a relatively small area could release more spores than a lighter growth of mold in a relatively large area. Choice of containment should be based on professional judgment. The primary object of containment should be to prevent occupant and remediator exposure to mold.

# **Containment Tips**

- Always maintain the containment area under negative pressure.
- Exhaust fans to outdoors and ensure that adequate makeup air is provided.
- If the containment is working, the polyethylene sheeting should billow inwards on all surfaces. If it flutters or billows outward, containment has been lost, and you should find and correct the problem before continuing your remediation activities.

# **Limited Containment**

Limited containment is generally recommended for areas involving between 10 and 100 square feet (ft<sup>2</sup>) of mold contamination. The enclosure around the moldy area should consist of a single layer of 6-mil, fire-retardant polyethylene sheeting. The containment should have a slit entry and covering flap on the outside of the containment area. For small areas, the polyethylene sheeting can be affixed to floors and ceilings with duct tape. For larger areas, a steel or wooden stud frame can be erected and polyethylene sheeting attached to it. All supply and air vents, doors, chases, and risers within the containment area must be sealed with polyethylene sheeting to

minimize the migration of contaminants to other parts of the building. Heavy mold growth on ceiling tiles may impact HVAC systems if the space above the ceiling is used as a return air plenum. In this case, containment should be installed from the floor to the ceiling deck, and the filters in the air-handling units serving the affected area may have to be replaced once remediation is finished.

The containment area must be maintained under negative pressure relative to surrounding areas. This will ensure that contaminated air does not flow into adjacent areas. This can be done with a HEPA-filtered fan unit exhausted outside of the building. For small, easily contained areas, an exhaust fan ducted to the outdoors can also be used. The surfaces of all objects removed from the containment area should be remediated/cleaned prior to removal. The remediation guidelines outlined in Appendix B can be implemented when the containment is completely sealed and is under negative pressure relative to the surrounding area.

# **Full Containment**

Full containment is recommended for the cleanup of mold-contaminated surface areas greater than 100 ft<sup>2</sup> or in any situation in which it appears likely that the occupant space would be further contaminated without full containment. Double layers of polyethylene should be used to create a barrier between the moldy area and other parts of the building. A decontamination room or airlock should be constructed for entry into and exit from the remediation area. The entryways to the airlock from the outside and from the airlock to the main containment area should consist of a slit entry with covering flaps on the outside surface of each slit entry. The chamber should be large enough to hold a waste container and allow a person to put on and remove PPE. All contaminated PPE, except respirators, should be placed in a sealed bag while in this chamber. Respirators should be worn until remediators are outside the decontamination chamber. PPE must be worn throughout the final stages of HEPA vacuuming and damp-wiping of the contained area. PPE must also be worn during HEPA vacuum filter changes or cleanup of the HEPA vacuum.

Local Reproduction is Authorized and Encouraged.

Appendix B: Laboratory Analysis Report

### **EXECUTIVE SUMMARY**

An industrial hygiene survey was conducted August 1, 2008 at the Armory Facility located in Baltimore, Maryland. The study was performed by Mr. Non-Responsive, CIH.

Employees were not performing tasks that provided excessive noise levels, as such; noise exposure monitoring was not conducted.

Lighting within the facility was also evaluated. Lighting was found to be within applicable recommended levels.

Various surfaces within the HVAC system and throughout the facility were screened for lead. The screening was completed using surface/wipe and air samples. None of the air samples collected were found to have detectable levels of the respective lead contaminant. Lead contamination was identified in the old firing range roof mounted HVAC system above Room M10.

Indoor air quality parameters were also evaluated during the assessment. Indoor air quality was found to be within those parameters established by the Environmental Protection Agency (EPA) and American Society of Heating, Refrigerating, and Airconditioning Engineers, Inc. (ASHRAE). The firing range is inactive but could have contributed to lead exposure to building occupants. Lead identified in the HVAC system could originate from outdoor environmental sources.

During the assessment, written programs for Health and Safety, NESHAP Operations and Maintenance Asbestos Survey, and the Hazard Communication Program were requested for review, however, the onsite personnel was not able to locate the documents.

May, 2018

### **Operation Description**

The 5<sup>th</sup> Regiment Armory primarily serves as an office setting and equipment storage facility. The facility consists of a four story response center that contains office spaces, decommissioned gun range, and storage areas.

The exterior walls of the building were constructed of stone. The interior walls were composed of a combination of concrete block, stone and sheetrock. The roof of the facility consisted of a built-up roof system. The heating, ventilating, and air conditioning system (HVAC) consisted of a split direct-expansion (DX) systems mounted on the roof. The floors were composed of a poured concrete slab and in some areas were finished with vinyl floor tiles or hard wood flooring. The ceilings were generally finished with a suspended drop ceiling system.

Site personnel at the time of the site assessment consisted of 70 administrative personnel. The employees on site were conducting general administrative work.

# **Noise Survey**

Employees were not performing tasks that provided excessive noise levels, as such; noise exposure monitoring was not conducted.

### Lead Testing

At the time of the assessment, no activities were observed which may lead to lead exposure. The facility contains an unoccupied room which was once an indoor firing range

Various surfaces within the facility were screened for lead using surface/wipe samples and the collection of air samples. Surface/wipe samples were collected using Ghost Wipe<sup>TM</sup> samples and were collected in accordance with the ASTM E 1792 protocols. Air samples were collected using 0.8 µm MCE cassettes attached to low volume air sampling pumps. Blank samples were submitted to the laboratory for quality control purposes. Samples were sent to AMA Analytical Services, Inc., in Lanham, MD for lead analysis using EPA Method 600/R-93/200 (M)-7420. A copy of the laboratory analysis report can be found in Appendix B.

Key: ND – None Detected PB – Lead

Detectable levels of lead were identified throughout the facility, specifically in the former indoor firing range, roof top mechanical unit and drill floor. The National Guard Bureau currently utilizes 200 ug/ft² as a benchmark for identifying contaminated surfaces. In the" Derivation of Wipe Surface Screening Levels for Environmental Chemicals", the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) has determined that 200 ug/ft² is a satisfactory surface contamination level unless the facility is utilized as a childcare facility. In such cases, HUD levels of 40  $\mu$ g/ft² on floors and 250  $\mu$ g/ft² on windowsills should be observed.

No detectable levels of lead were identified in those air samples collected. Currently, OSHA observed an 8-hour time weighted average of 50 ug/m³. Deteriorated paint was observed throughout the facility.

Delaminated paint was mostly due to age along with prolonged exposure to elevated humidity levels. Deteriorated paint was observed on the Drill Floor at between Rooms D26 and D27, Room D7, Old Firing Range, hallway at Basement Classroom 1 outside of the old motor room, basement level restroom at garage entrance, hallway between Basement Classroom 1 and 2 and mezzanine level hallway between rooms M6 and M9.

Samples collected from the basement level door adjacent to Classroom 1 and the wall in the Publications office were found to be lead-based paint.

## **Lighting**

A lighting assessment was conducted throughout the facility. The survey was conducted with large bay doors closed. Measurements were collected using a Cooke Cal-Light 400L Precision Light Meter (Serial No. 98047EL). The light meter was last calibrated on February 22, 2008. Measurements collected were compared to ANSI/IESNA RP-7-01 Lighting Industrial Facilities and RP-1-04 Office Lighting.

## **Indoor Air Quality**

Survey measurements were made for ventilation and comfort parameters (carbon dioxide, temperature, and relative humidity). The air quality measurements were collected using direct reading instrumentation for comfort parameters using a Fluke IAQ Meter, Model 975. The IAQ Meter was last calibrated in April 2008.

The American Society of Heating, Refrigerating, and Air Conditioning Engineers, Inc. (ASHRAE) have developed indoor air quality guidelines for mechanically ventilated office buildings and commercial settings (ASHRAE standard 62.1-2007). ASHRAE specifies temperature and relative humidity ranges for human comfort (ASHRAE 55-2004). The US Army Technical Guide 277 Army Facilities Management Information Document on Mold Remediation, recommends maintaining a relative humidity range between 30 to 60% in occupied areas.

The recommendations for temperature and humidity are based on seasonal and regional influences to allow comfort for 80% of a building's population.

### First Floor

The temperature readings from the interior of the structure ranged from 71.8°F to 80.6°F with relative humidity readings ranging from 41.3% to 60.8%. During the survey, CO<sub>2</sub> levels ranged from 486 ppm to 709 ppm.

### Second Floor

The temperature readings from the interior of the structure ranged from 70.9°F to 78.8°F with relative humidity readings ranging from 42.8% to 62.3%.

During the survey, CO<sub>2</sub> levels ranged from 416 ppm to 619 ppm.

A water intrusion event was ongoing in second floor rooms 27, 26 and 25. The Facilities Department was aware of the condition. Water intrusion was occurring from above the second floor ceiling. The source of the water intrusion was suggested by Facilities to be related condensation on the chiller lines. The occupants in Suite 27 used waste cans for water collection and covered several desks with poly sheeting.

Water damaged ceiling panels were identified in Rooms 27, 4, 10, 11 and 30. Water intrusion appeared to be condensation from above the ceiling grid.

### Mezzanine Floor

The temperature readings from the interior of the structure ranged from 70.2°F to 82.4°F with relative humidity readings ranging from 41.1% to 60.2%.

During the survey, CO<sub>2</sub> levels ranged from 422 ppm to 700 ppm.

### Basement Level

The temperature readings from the interior of the structure ranged from 72.3°F to 83.3°F with relative humidity readings ranging from 41.6% to 51.9%. 2 ppm of carbon monoxide was detected throughout the parking area of the basement. Carbon monoxide was not detected within any other occupied area.

During the survey, CO<sub>2</sub> levels ranged from 486 ppm to 709 ppm. Based on the outdoor levels observed at the time of the testing, the maximum indoor concentration of CO<sub>2</sub>

recommended is 1,119 ppm (419 ppm + 700 ppm). The results of the testing met the ASHRAE guidelines.

Based on a review of the indoor air quality parameters, no areas were found to exceed their recommended level

Air quality samples were collected from Rooms D7 (First Floor), Suite 12 (Second Floor), Suite 4 (Second Floor) and Suite 27 (Second Floor) as well as outdoors (as control). Indoor fungal spore levels ranged from 578 to 1,070 spores/m³. The concentration observed outdoors was found to be 5,620 spores/m³. The highest indoor concentration was identified in D7. Suite 27 was found to have a slight amplification in *Aspergillus/Penicillium* levels compared to both indoor samples as well as the outdoor control. Suite 27 was also found to have the most significant amount of moisture impacted ceiling tiles as well as several individual offices using waste cans to collect condensation/water intrusion.

| Location              | Concentration           | Predominant Genera      |
|-----------------------|-------------------------|-------------------------|
| D7 – Facility Manager | 1,070 sp/m <sup>3</sup> | Basidiospores           |
| 12                    | 744                     | Basidiospores           |
| 4                     | 661                     | Basidiospores           |
| 27                    | 578 sp/m <sup>3</sup>   | Aspergillus/Penicillium |
| Outdoors              | 5,620 sp/m <sup>3</sup> | Basidiospores           |

### Suspect Asbestos Containing Building Materials

Suspect asbestos containing materials include sheetrock/joint compound, plaster wall and ceiling systems, floor tiles and associated mastic, and vinyl covebase. Thermal system insulation was found to be a combination of paper wrapped fiberglass with PVC elbows and well as pre-formed TSI with mudded elbows. 9" x 9" floor tile was identified on stairwells and landings of the basement level.

### Maintenance Bay

No maintenance bay was identified at this facility.

### Ventilation System Assessment

The heating, ventilating, and air conditioning system (HVAC) consisted of a split direct-expansion (DX) system. Units were mounted on the roof of the facility. Dust loading was present on the supply diffusers, return vent and fiberglass insulation of the roof mounted units.

Lead levels of 520 and 970  $\mu$ g/ft<sup>2</sup> were identified on the interior insulation of one of the roof mounted units (Located above Room M10). The National Guard Bureau currently utilizes 200  $\mu$ g/ft<sup>2</sup> as a benchmark for identifying contaminated surfaces. In the Derivation of Wipe Surface Screening Levels for Environmental Chemicals, the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) has determined that 200  $\mu$ g/ft<sup>2</sup> is a satisfactory surface contamination level unless the facility

is utilized as a childcare facility. Generally, the systems appeared to need a general cleaning of the diffusers, ductwork, interior insulation and coils. The fans could not be assessed at the time of the survey.

### <u>Limitations</u>

This report summarizes our evaluation of the conditions observed at the above referenced location. Our findings are based upon our observations and sampling results obtained at the facility at the time of our visit. The report, results, and subsequent recommendations reported herein are also limited to the information available at the time it was prepared and investigated. Conditions may have been in effect prior to the sampling events that have changed over time and which cannot be predicated within the scope of this limited investigation. Any conditions discovered which deviate from the data contained in this report should be presented to us for our evaluation.

This report is intended for the exclusive use of the client. This report and the findings herein shall not, in whole or in part, be relied upon by any other parties, disseminated or conveyed to any other party without prior written consent of the National Guard Bureau, and The El Group, Inc. The findings are relative to the dates of our site visits and should not be relied upon for substantially later dates.

This report applies only to the sample, or samples, investigated and is not necessarily indicative of the quality or condition of apparently identical or similar products. As a mutual protection to clients, the public, and these Laboratories, this report submitted and accepted for the exclusive use of the client to whom it is addressed and upon the condition that it is not to be used, in whole or in part, in any advertising or publicity matter without prior written authorization from us. Sample types locations, and collection protocols are based upon the information provided by the persons submitting them and, unless collected by personnel of these Laboratories, we expressly disclaim any knowledge and hability for the accuracy and completeges of this information. Residual sample material will be discarded in accordance with the appropriate regulatory guidelines, unless otherwise requested by the client. NVLAP accreditation applies only to polarized light microscopy of bulk samples and transmission electron microscopy of AHERA air samples. This report must not be used to claim, and does not imply product certification, approval, or endorsement by NYLAP, NIST, or any agency of the Federal Government. All rights reserved

## General Comments, Disclaimers, and Footnotes

Analytical Method:

Sample are analyzed following the instructions and guidelines outlined in AMA Analytical Services, Inc. SOP 901.

Sample Condition:

Acceptable: The sample was collected and delivered to the our location without disturbing the material on the sampling

media

Unacceptable: 1. The sample is overloaded with material. 2. The sample trace has been disturbed. 3. The sample was

not collected properly.

Obscured: The loading on the sample is high, possibly obscuring spores present. The quantity reported

should be considered the minimum concentration present. The actual concentration may be higher than the

reported concentration.

Spore Notes:

Based on their small size and very few distinguishing characteristics, Aspergillus and Penicillium cannot be differentiated by non-viable sampling methods. There are other types of spores whose morphology is similar to Aspergillus and Penicillium and cannot be differentiated by non-viable sampling methods. Examples of these similar spores are Acremonium, Paecilomyces, Wallemia, and Trichoderma.

Smut, Periconia and Myxomycetes are three different types of organisms that have similar morphological characteristics.

Bipolaris/Dreschlera/Helm: Bipolaris / Dreschlera / Helminthosporium group.

Other Colorless represents all colorless spores that are non-distinctive and unidentifiable.

\* Hyphal Fragments: A portion of the mycelium that becomes separated from the remainder of the thallus (vegetative body), each of which has the capacity to grow and form new individuals. Results for hyphal fragments are in fragments/m³ and are not incorporated in the total spore concentration.

**Ouantification:** 

Analytical Sensitivity (A.S.): This is dependent on the volume of air collected and the amount of the trace that was analyzed.

The value of "Present" indicated in the Raw Count column represents the presence of this spore type during the preliminary exam at 400x. The Raw Count converts to a whole number if the spore type is encountered again during the 1,000x enumeration. The sp/m³concentration will be reported as less than the analytical sensitivity if "Present" is reported in the Raw Count.

Due to rounding, totals may not equal 100%

sp/m3: Spores per cubic meter.

Results are reported to 3 significant figures.

# Section 1.0 Executive Summary

## Section 1.0 Executive Summary

An industrial hygiene survey was conducted August 13, 2010, at the Fifth Regiment Armory located at 29<sup>th</sup> Division, Baltimore, MD 21201. The study was performed by Ms. Non-Responsive and Mr. Non-Responsive

- 1. Lead surface, air and bulk samples were collected. Surface levels of lead exceeded 200 ug/ft<sup>2</sup> in the basement on the floor outside the firing range.
  - Housekeeping and cleaning should be improved to maintain lead levels below 200 ug/ft<sup>2</sup>. Damaged paint should be repaired and properly remediated.
- Lighting levels met the minimum recommended guidelines in all but four areas:
   Drill Hall 2) Facilities Engineering Office, 3) Office D15, 4) Office M30.
   Lighting should be improved in these areas.
- 3. Indoor air quality parameters of temperature, relative humidity, carbon monoxide and carbon dioxide (ventilation) were evaluated during the assessment. Relative humidity exceeded the recommended ceiling of 60% and temperature exceeded the recommended criteria of 79 degrees F in some indoor locations. There is no central air conditioning system in this building. Outdoor conditions were hot and humid. Relative humidity should be maintained at 30-60%. Low relative humidity can lead to the drying of mucous tissues and an increased susceptibility to respiratory infection. High relative humidity can provide an environment suitable for microbial growth and proliferation. For comfort, temperature levels should be maintained between 73-79 degrees F.
- 4. A visual inspection was conducted throughout visually accessible portions of the facility. The visual inspection was conducted to assess sources or pathways of factors potentially deleterious to IAQ. The visual inspection revealed the following items that may be potential sources of poor IAQ:
  - a. Peeling paint is present in many areas of the building. Peeling paint should be repaired and properly remediated.
  - b. Water damaged ceilings and/or ceiling tiles were observed in numerous locations. Water damaged ceiling tile should be removed and replaced. Water damaged ceiling areas should be repaired. The source of water infiltration should be identified and repaired.
  - c. Suspected fungal growth was noted in the following locations:
    - i. Parking garage on the wall opposite the mechanical unit (see photo).
    - ii. Pipe insulation in boiler room (see photo).
    - iii. Parking garage supply vent had a visible accumulation of dirt, debris and possible fungal growth (see photo).

## **BEST AVAILABLE COPY**

Visible fungal growth should be properly remediated. Fungal growth in the indoor environment is always the result of some source of uncontrolled water infiltration. All sources of water infiltration should be identified and repaired. Do not permit dirt, debris, microbial growth, etc. to accumulate in any portion of the HVAC system including the supply and return vents.

5. Damaged window glazing was observed at some windows (see photo). A bulk sample of this damaged glazing was collected and analyzed by PLM. Trace amounts of asbestos were identified. The laboratory recommended further analysis of this material by transmission electron microscopy (TEM) to better quantify the amount of asbestos present. Further action such as abatement would depend on the TEM sample result.

# Section 2.0 Operation Description & Observations

## Section 2.0 Operation Description & Observations

The Fifth Regiment Armory is a large facility consisting of  $343,552~{\rm ft}^2$ . It is mainly an administrative facility with many offices, training and storage areas. There were approximately 300-400 full-time employees stationed at this facility at the time of this survey.

The building was initially constructed in 1901. There have been several renovations throughout the years. The exterior is stone. The interior walls are primarily plaster with some areas of drywall. The floors were composed of a poured concrete slab with different types of flooring present including vinyl floor tile. The ceitings were generally composed of a roof deck and some areas were finished with a suspended drop ceiling system.

The heating, ventilating, and air conditioning system (HVAC) consisted of central air-conditioning on the 3<sup>rd</sup> and 4<sup>th</sup> floors and window unit air conditioners on the basement, 1<sup>st</sup>, and 2<sup>rd</sup> floors. There is a boiler heated with natural gas. Outdoor air ventilation occurs via the HVAC system on the 3<sup>rd</sup> and 4<sup>th</sup> floors and open windows, doors, etc in other areas. Many doors and windows were open on the day of this survey. HVAC maintenance is performed by in-house personnel. A limited inspection of the air-handler was performed. The unit could not be opened for inspection. Portions of the unit that could be observed were clean and appeared in good condition.

There is an old firing range in the basement. It was closed in the 1970's and has been fully abated. ALSI could not obtain access to the old firing range area. It was locked and personnel at the site did not have keys. It is a restricted area and not utilized.

Overall housekeeping was good. Areas were clean and well kept.

No ergonomic concerns were reported. Office areas have computer work stations. Work stations appeared properly designed. Personnel had supportive chairs.

# Section 3.0 Noise Survey

# Section 3.0 Noise Survey

Employees were not performing tasks that provided excessive noise levels. Therefore, noise exposure monitoring was not conducted.

# Section 4.0 Lead Testing

# Section 4.0 Lead Testing

At the time of the assessment, no activities were observed which would generate lead exposure. The facility contains an area in the basement which was once an indoor firing range. It has been abated. The area is locked. No one is permitted in the area. There is no child care facility in the armory.

Various surfaces within the facility were screened for lead using surface/wipe samples. Surface/wipe samples were collected in accordance with the ASTM E 1792 protocols. Air samples were collected using 0.8 um mixed cellulose ester (MCE) filter cassettes attached to low volume air sampling pumps. Blank samples were submitted to the laboratory for quality control purposes. Samples were sent to AMA Analytical Services, Inc., in Lanham, Maryland, for lead analysis using EPA Method 600/R-93/200 (M)-7420. A copy of the laboratory analysis report can be found in Appendix A.

Lead Testing Results Summary

| Sample # | Location                                                      | Air<br>ug/m³ | Surface<br>ng/ft²            | Paint Chip<br>%Pb |

| Criteria |                                                         | 50            | 200                           | 0.5               |

Key: Bolded results exceed listed criteria

Lead surface, air and bulk samples were collected. Surface levels of lead exceeded 200 ug/ft<sup>2</sup> in the basement on the floor outside the firing range.

The National Guard Bureau currently utilizes 200 ug/ft<sup>2</sup> as a benchmark for identifying lead-contaminated surfaces. In the "Derivation of Wipe Surface Screening Levels for Environmental Chemicals," the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) has determined that 200 ug/ft<sup>2</sup> is a satisfactory surface contamination level unless the facility is utilized as a childcare facility. In such cases, U.S. Department of Housing and Urban Development (HUD) limit of 40 ug/ft<sup>2</sup> on floors and 250 ug/ft<sup>2</sup> on windowsills should be observed. There is no child care provided at this facility.

Air samples for lead were below the Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit of 50 ug/m<sup>3</sup>. In fact, no detectable level of lead was identified in the air samples collected.

Deteriorated paint was observed in many locations throughout the facility. Delaminated paint was mostly due to age along with prolonged exposure to elevated relative humidity levels. A paint chip sample was collected from peeling paint in two locations. Results were found to be below the HUD definition of lead-based paint (0.5%).

Housekeeping and cleaning should be improved to maintain lead levels below 200  $\text{ug/}\text{R}^2$ . The damaged paint should be repaired and properly remediated.

# Section 5.0 Lighting

# Section 5.0 Lighting

A lighting assessment was conducted throughout the facility. Measurements were collected using a Cooke Cal-Light 400L Precision Light Meter (Serial No. K070003). The light meter was last calibrated on November 26, 2009. Measurements collected were compared to ANSI/IESNA RP-7-01 Lighting Industrial Facilities and RP-1-04 Office Lighting.

Light Survey Assessment Summary

| Location                                         | Foot Candles | Recommended<br>Lighting | Sufficient<br>Lighting |
|--------------------------------------------------|--------------|-------------------------|------------------------|

| Basement - Conference Room                       | 67,4         | 30-50                   | Yes                    |
| Second Floor - M30                               | 25.0         | 30-50                   | <u>No</u>              |
| Second Floor - M5B                               | 55.5         | 30-50                   | Yes                    |
| Second Floor Public Affairs                      | 100.0        | 30-50                   | <u> </u>               |
| Second Floor – Inspector<br>Generals Office      | 180.9        | 30-50                   | Yes                    |
| Third Floor - Air Guard                          | 89.5         | 30-50                   | Yes                    |
| Third Floor Room 9                               | 135.3        | 30-50                   | Yes                    |
| Third Floor - Room 15                            | 121.0        | 30-50                   | Yes                    |
| Third Floor - Room 23                            | 97.0         | 30-50                   | Yes                    |
| Fourth Floor - Dining Hall                       | 42.6         | 10                      | Yes                    |

Lighting levels met the minimum recommended guidelines in all but four areas: 1) Drill Hall 2) Facilities Engineering Office, 3) Office D15, 4) Office M30. Lighting should be improved in these areas.

# Section 6.0 Indoor Air Quality

## Section 6.0 Indoor Air Quality

Survey measurements were collected for ventilation and comfort parameters (carbon dioxide, temperature, and relative humidity). The air quality measurements were collected using direct reading instrumentation for comfort parameters using a QTRAK IAQ Meter, Model 7565X (Serial # 0839020). The IAQ Meter was last calibrated in March 2010.

The American Society of Heating, Refrigerating, and Air Conditioning Engineers, Inc. (ASHRAE) have developed indoor air quality guidelines for mechanically ventilated office buildings and commercial settings (ASHRAE standard 62.1-2007). ASHRAE specifies temperature and relative humidity ranges for human comfort (ASHRAE 55-2004). The US Army Technical Guide 277 Army Facilities Management Information Document on Mold Remediation, recommends maintaining a relative humidity range between 30 to 60% in occupied areas.

The recommendations for temperature and humidity are based on seasonal and regional influences to allow comfort for 80% of a building's population. The temperature readings from the interior of the structure ranged from 74.8 to 81.7 degrees F with relative humidity readings ranging from 40.8% to 69.2%. During the survey, carbon dioxide (CO<sub>2</sub>) levels ranged from 343 ppm to 715 ppm within the facility compared to an outdoor CO<sub>2</sub> level of 332 ppm. Based on the outdoor levels observed at the time of the testing, the maximum indoor concentration of CO<sub>2</sub> recommended is 1,032 ppm (332 ppm - 700 ppm). Carbon monoxide (CO) ranged from 0.0 + 0.1 ppm. The following table summarizes the measurements collected.

IAQ Assessment Summary

| Location                                         | Temperature (°F) | Relative<br>Humidity<br>(%) | Carbon<br>Dioxide<br>(ppm) | Carbon<br>Monoxide<br>(ppm) |
|--------------------------------------------------|------------------|-----------------------------|----------------------------|-----------------------------|
| Outdoors                                         | 77.6             | 71.3                        | 332                        | 0.0                         |

Key: Bolded results exceed listed criteria

Relative humidity exceeded the recommended ceiling of 60% and temperature exceeded the recommended criteria of 79 degrees F in a few locations primarily in areas where no central air-conditioning was present. Central air-conditioning is present on the 3<sup>rd</sup> and 4<sup>th</sup> floors. Outdoor conditions were hot and humid. Relative humidity should be maintained at 30-60%. Low relative humidity can lead to the drying of mucous tissues and an increased susceptibility to respiratory infection. High relative humidity can provide an environment suitable for microbial growth and proliferation.

Carbon dioxide levels did not exceed the recommended ceiling of 1,032 ppm. This suggests that outdoor air ventilation is adequate in these areas. A mechanical ventilation system which includes the introduction of outdoor air into areas is present on the 3<sup>rd</sup> and 4<sup>th</sup> floors. No outdoor air ventilation is introduced into the building via the HVAC system in the basement. 1<sup>st</sup> and 2<sup>rd</sup> floors.

A visual inspection was conducted throughout visually accessible portions of the facility. The visual inspection was conducted to assess sources or pathways of factors potentially deleterious to IAQ. The visual inspection revealed the following items that may be potential sources of poor IAQ:

- 1. Peeling paint is present in many areas of the building. Peeling paint should be repaired and properly remediated.
- Water damaged ceilings and/or ceiling tiles were observed in numerous locations.
  Water damaged ceiling tile should be removed and replaced. The source of water
  infiltration should be identified and repaired.
- 3. Suspected fungal growth was noted in the following locations:
  - o Parking garage on the wall opposite the mechanical unit (see photo).
  - Pipe insulation in boiler room (see photo).
  - Parking garage supply vent had a visible accumulation of dirt, debris and possible fungal growth (see photo).

## BEST AVAILABLE COPY

Visible fungal growth should be properly remediated. Fungal growth in the indoor environment is always the result of some source of uncontrolled water infiltration. All sources of water infiltration should be identified and repaired. Do not permit dirt, debris, microbial growth, etc. to accumulate in any portion of the HVAC system including the supply and return vents.

4. The outdoor air intake on the roof (see photo). There were no sources of reentrainment of pollutants noted at the time of this survey. It should be noted that the outdoor air intake is in a very crowded location with numerous pieces of mechanical equipment, ductwork, etc. The potential for reentrainment of pollutants exists if mechanical equipment malfunctions occur.

# Section 7.0 Suspect Asbestos Containing Building Materials

# Section 7.0 Suspect Asbestos Containing Building Materials

ALSI personnel performed a walk-through visual inspection for suspect asbestos containing materials (ACM). No demolition was performed. Inaccessible areas were not inspected. No samples were collected.

Suspect ACM could include sheetrock/joint compound, plaster wall and ceiling systems, floor tiles and associated mastic, and vinyl cove base. Thermal system insulation which is most likely a combination of paper wrapped fiberglass with PVC clbows and well as pre-formed TSI with mudded elbows was suspected.

The following are the notable findings regarding suspect ACM at the time of this survey:

- Damaged window glazing was observed at some windows (see photo). A bulk sample (Sample #1008519-26) of this damaged glazing was collected and analyzed by PLM. Trace amounts of asbestos were identified by PLM analysis. The laboratory recommended further analysis of this material by transmission electron microscopy (TEM) to better quantify the amount of asbestos present. Further action such as abatement would depend on the TEM sample result.
- 2. Tank insulation and a fire door are suspect ACM in the boiler room
- 3. 9" x 9" vinyl floor tile and mastic is present in approximately 40% of the office areas. Most areas were in good condition. Some areas are covered with carpet.

# Section 8.0 Maintenance Bay

# Section 8.0 Maintenance Bay

There is a maintenance bay or service garage area at this facility.

# Section 9.0 Limitations

## Section 9.0 Limitations

This report summarizes our evaluation of the conditions observed at the above referenced location. Our findings are based upon our observations and sampling results obtained at the facility at the time of our visit. The report, results, and subsequent recommendations reported herein are also limited to the information available at the time it was prepared and investigated. Conditions may have been in effect prior to the sampling events that have changed over time and which cannot be predicted within the scope of this limited investigation. Any conditions discovered which deviate from the data contained in this report should be presented to us for our evaluation.

This report is intended for the exclusive use of the client. This report and the findings herein shall not, in whole or in part, be relied upon by any other parties, disseminated or conveyed to any other party without prior written consent of the National Guard Bureau, and Analytical Laboratory Services, Inc. The findings are relative to the dates of our site visits and should not be relied upon for substantially later dates.

The following featnotes only apply to those samples which the total aspestos result is flagged with a note number.

ï.

1008519-26

1070992

- TEM RECOMMENDATION Please note, due to resolution limitations with optical unicroscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestes nity contain a significant quantify of asbestes. It is recommended that the additional analytical technique of TEM be used to check for asbestes fibers below the resolution limits
- MATRIX REDIXCTION RECOMMENDATION Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asheaves may contain a significant quantity of asbestos which is obscared from view. It is recommended that the additional preparation technique of graviments reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method . EPA/609/R-93/116 dated July 1993

TR = "Trace equals less than 1% of this component" Uncertainty: For samples containing asbestos in range of 1-10% the CV is 0,43, 11-35% CV=0.55, >35 CV=0.23 NAD = "No Asbestos Detected"

All results are to be considered preliminary and subject to charge unless signed by the Technical Director or Deputy.

begins, and collection professive upon the information provided by the persons submitting them and, unless collected by personal fluid information. Residual samples only to palarized light informacy and completeness of this information. Residual samples only to palarized light informacy with the repersonal propriate regulatory guidelians, unless offerenced by the client. NYLAP accreditation applies only to palarized light informacy of bulk samples and transmission electron mirroscopy of AHERIA mirroruphs. This report must not be used to claim, and done not imply product certification, approval, or endorsement by NY REAP, NYLAP, NST, or any agency of the Federal Coverencent. All rights This report applies only to the sample, er sample, investigated and is not necessarily indicative of the quality or condition of apparently identical or similar products. As a mutual protection to clients, the public, and those Laboratories, this report is samplified and accepted for the exclusive use of the ellent to whom it is addressed and upon the evention that it is not to be used, in whole or in part, in any advertibing or publicity mether without prior written authorization from us. #### **Section 1.0 Executive Summary**

An industrial hygiene survey was conducted on October 9, 2013, at the 5<sup>th</sup> Regiment Readiness Center located at 29<sup>th</sup> Division Street, Baltimore, MD 21201. The survey was performed by Mr. Non-Responsive and Mr. Non-Responsive.

- 1. Lead surface, bulk, and air samples were collected. Lead surface samples exceed the recommended guideline at two locations. One of the bulk samples was above the lead based paint limit. See Section 3.0 for detailed sampling results.
- 2. Lighting levels did not meet the American National Standards Institute/Illuminating Engineering Society of North America (ANSI/IESNA) recommended guideline in three locations. See Section 4.0 for detailed findings.
- 3. Indoor air quality (IAQ) parameters of temperature, relative humidity, carbon monoxide and carbon dioxide (ventilation) were evaluated during the assessment.
  - a. Temperature levels met the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE) 55-2010 recommended guideline of 68-79 °F in areas sampled.
  - b. The relative humidity levels met the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) TG 277 recommended guideline of 30-60% in areas sampled.
  - c. Carbon monoxide (CO) levels were less than the National Ambient Air Quality Standard (NAAQS) recommended ceiling of 9 parts per million (ppm).
  - d. Carbon dioxide (CO<sub>2</sub>) levels met the ASHRAE 62.1-2013 recommended guidelines for mechanically ventilated office buildings and commercial settings.

See Section 5.0 for detailed sampling results.

#### **Section 2.0 Operation Description & Observations**

The 5<sup>th</sup> Regiment Readiness Center is mainly an administrative facility with a drill hall, offices, and classrooms. There were 300-400 full-time employees stationed at the facility at the time of this survey. There are 2 maintenance person assigned to the building.

The building is reported to have been built in 1901. It is a four (4) story structure with a basement. The exterior is quarry stone. The interior walls are drywall, block, concrete, and ceramic. The floors are wood, concrete, 12"x12" floor tiles, 9" x 9" floor tiles, and ceramic tile.

The heating system is a gas-fired hot water unit. Air conditioning in the facility is supplied by a roof-top unit and window units.

There is no child-care facility in the building.

No ergonomic concerns were reported. Office areas have computer work stations. Work stations appeared to be properly designed. Personnel had supportive chairs.

This facility contains a converted firing range (CFR) being used as a storage area (no access).

Suspect asbestos containing material (ACM) and chipped/peeling suspect lead-based paint were observed at the time of this survey.

Housekeeping is adequate.

It was reported that the building has several roof leaks.

Water damaged ceiling tiles were observed in several locations in the facility.

#### **Section 3.0 Lead Testing**

Various surfaces within the facility were screened for lead using surface/wipe samples. Surface/wipe samples were collected in accordance with the American Society for Testing and Materials (ASTM) E 1792 protocols. Air samples were collected using 0.8 micrometer (um) mixed cellulose ester (MCE) filter cassettes attached to low volume air sampling pumps. Blank samples were submitted to the laboratory for quality control purposes. Samples were sent to AMA Analytical Services, Inc., in Lanham, Maryland, for lead analysis using Environmental Protection Agency (EPA) Method 600/R-93/200 (M)-7420. A copy of the laboratory analysis report can be found in Appendix A.

#### **Lead Testing Results Summary**

| Sample # | Location                           | Bulk<br>(%) | Air<br>ug/m <sup>3</sup> | Surface<br>ug/ft <sup>2</sup> |
|----------|------------------------------------|-------------|--------------------------|-------------------------------|
| 1        | Drill Hall                         | *           | <5.5                     | *                             |
| 2        | CFR Corridor                       | *           | < 5.6                    | *                             |
| 3        | Blank                              | *           | <3                       | *                             |
| 4        | Blank                              | *           | *                        | <12                           |

| 20       | CFR Corridor Wall                  | 0.51        | *                        | *                             |
| 21       | 2 <sup>nd</sup> Floor Wall         | 0.014       | *                        | *                             |
| -        | Criteria                           | 0.5         | 50                       | 200                           |

#### Table Notes:

- 1. **Bolded** results exceed listed criteria
- 2. **ppm** = parts per million
- 3.  $ug/ft^2 = micrograms per square foot$
- 4.  $ug/m^3 = micrograms per cubic meter$
- 5. **ug** = micrograms

#### Sources:

- 1. NG PAM 420-15 Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges
- 2. OSHA 29CFR1910.1025 Lead Standard

The National Guard Bureau currently utilizes 200 micrograms per square foot (ug/ft²) as a benchmark for identifying lead-contaminated surfaces. This guideline is referenced in NG PAM 420-15 "Guidelines and Procedures for Rehabilitation and Conversion of Indoor Firing Ranges" as a satisfactory surface contamination level unless the facility is utilized as a childcare facility. In such cases, U.S. Department of Housing and Urban Development (HUD) limit of 40 ug/ft² on floors and 250 ug/ft² on window sills should be observed. There is no child care provided at this facility.

Lead surface, air, and bulk samples were collected. The following is a summary of the sample results from this survey.

- Surface levels of lead were above the recommended guideline of <200 ug/ft<sup>2</sup> on the drill hall cabinet and band storage room table.
- Air samples for lead were below the Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit of 50 micrograms per cubic meter (ug/m³).
- Bulk samples for lead were above the lead based paint limit on the wall of the converted firing range corridor.

#### **Section 4.0 Lighting**

A lighting assessment was conducted throughout the facility. Measurements were collected using a Cooke Cal-Light 400 Precision Light Meter (Serial No. 98011EL). The light meter was last calibrated in November 2012. Measurements collected were compared to ANSI/IESNA RP-7-01 Lighting Industrial Facilities and RP-1-04 Office Lighting.

**Light Survey Assessment Summary** 

| Location          | Foot Candles | Recommended   | Sufficient |
|-------------------|--------------|---------------|------------|
|                   | (FC)         | Lighting (FC) | Lighting   |
| Drill Hall        | 25.8         | 10            | Yes        |
| Garage            | 7.0          | 75            | No         |
| Band Storage Room | 69.8         | 30            | Yes        |
| Amory Lounge      | 50.3         | 10            | Yes        |
| Armory Office     | 84.0         | 30-50         | Yes        |
| Office D28        | 56.4         | 30-50         | Yes        |
| Conference D28A   | 26.3         | 30            | No         |
| Copy Room         | 62.8         | 10            | Yes        |
| Mail Room         | 66.1         | 50            | Yes        |
| Office D25A       | 58.7         | 30-50         | Yes        |
| Office 25B        | 46.0         | 30-50         | Yes        |
| Office M5A        | 74.1         | 30-50         | Yes        |
| Office M21        | 25.4         | 30-50         | No         |
| Office M18        | 67.7         | 30-50         | Yes        |
| Office M17        | 37.9         | 30-50         | Yes        |
| Office 17A        | 51.3         | 30-50         | Yes        |
| Office B12        | 74.3         | 30-50         | Yes        |
| Office 10         | 151.4        | 30-50         | Yes        |
| Dining Room       | 45.0         | 30-50         | Yes        |

Table Notes:

- 1. FC = Foot Candles
- 2. **Bolded** results did not meet listed criteria

Source: ANSI/IESNA RP-7-01 Lighting Industrial Facilities and RP-1-04 Office Lighting.

The lighting levels did not meet the minimum recommended guideline in Conference D28A, Office M21, and Vehicle Maintenance Garage.

#### **Section 5.0 Indoor Air Quality**

Survey measurements were made for comfort parameters and ventilation (temperature, relative humidity, carbon dioxide, and carbon monoxide). The air quality measurements were collected using direct reading instrumentation for comfort parameters using a QTRAK IAQ Meter, Model 7575-X (Serial #39018). The IAQ Meter was last calibrated in March 2013.

The American Society of Heating, Refrigerating, and Air Conditioning Engineers, Inc. (ASHRAE) have developed indoor air quality guidelines for mechanically ventilated office buildings and commercial settings (ASHRAE standard 62.1-2013). ASHRAE specifies temperature ranges for human comfort (ASHRAE 55-2010). The US Army Technical Guide 277 Army Facilities Management Information Document on Mold Remediation, recommends maintaining a relative humidity range between 30 to 60%.

The following table summarizes the measurements collected.

**IAQ Assessment Summary** 

| Location   | Temperature (°F) | Relative<br>Humidity<br>(%) | Carbon<br>Dioxide<br>(ppm) | Carbon<br>Monoxide<br>(ppm) |
|------------|------------------|-----------------------------|----------------------------|-----------------------------|
| Outdoors   | 64.9             | 50.5                        | 389                        | 1.5                         |
| AMO Office | 72.1             | 47.8                        | 510                        | 0.4                         |
| Office D28 | 72.4             | 47.0                        | 630                        | 0.6                         |
| Office M5A | 73.3             | 45.3                        | 485                        | 0.5                         |
| Office M21 | 72.9             | 47.1                        | 516                        | 0.6                         |
| Office M18 | 73.3             | 46.7                        | 777                        | 0.9                         |
| Criteria   | 68-79            | 30-60                       | <1,089                     | <9                          |

Table Notes:

- 1. **Bolded** results exceed listed criteria
- 2. **ppm** = parts per million
- 3. (%) = percent relative humidity
- 4.  ${}^{\circ}\mathbf{F} = \text{degrees Fahrenheit}$

Sources: The American Society of Heating, Refrigerating, and Air Conditioning Engineers, Inc. (ASHRAE) 55-2010, 62.1-2013, Environmental Protection Agency (EPA) National Ambient Air Quality Standard (NAAQS) & The US Army Technical Guide 277 Army Facilities Management Information Document on Mold Remediation.

#### Summary of findings and recommendations:

- Temperature measurements met the recommended 68-79°F in all locations measured.
- Relative humidity levels met the recommended guideline of 30 60 % in all locations measured.
- Carbon dioxide levels were measured to evaluate building ventilation or the introduction of outdoor air into the building. The recommended ceiling is obtained by adding 700 ppm to the measured outdoor carbon dioxide level. For this survey, carbon dioxide levels did not exceed the recommended ceiling of 1,089 ppm (700 ppm + 389 ppm). This is an indication that outdoor air ventilation is adequate.
- Carbon monoxide levels measured were less than the recommended ceiling of 9 ppm. The recommended ceiling of 9 ppm referenced in the above table is the National Ambient Air Quality Standard for carbon monoxide
- A visual inspection was conducted throughout accessible portions of the facility to assess sources or pathways of factors potentially deleterious to IAQ. The following observation was noted:
  - 1. It was reported that the roof leaks in several places. Water-damaged ceiling tiles were observed in the administrative area stairwell. Sources should be identified and corrected to ensure no further damage occurs.
  - 2. Chipped and peeling paint (~750 square feet) was observed on walls in several areas of the facility. Samples were collected for lead paint analysis.

#### **Section 6.0 Suspect Asbestos Containing Building Materials (ACM)**

Suspect asbestos containing material (ACM) was noted at the time of this survey. 9"x9" floor tile was observed in the basement comprising approximately 40% of the total floor area.

Inaccessible areas such as behind walls or crawlspaces were not inspected. ACM could potentially be present in these areas.

#### **Section 7.0 Equipment**

The following equipment was utilized during this survey. All sampling equipment was properly calibrated prior to use and verified for accuracy as applicable. See daily reports and calibration logs for detailed information.

| Equipment                 | Serial # | <b>Calibration Date</b> | Value    |
|---------------------------|----------|-------------------------|----------|
| TSI QTrak IAQ Meter       | 1228014  | 5/2013                  | NA       |
| Cal Light 400 Light Meter | 98011EL  | 11/2012                 | NA       |
| SKC Air Sampling Pump     | 647631   | 10/09/13                | 2.58 LPM |
| SKC Air Sampling Pump     | 648349   | 10/09/13                | 2.55 LPM |

#### **Section 8.0 Limitations**

This report summarizes our evaluation of the conditions observed at the above referenced location. Our findings are based upon our observations and sampling results obtained at the facility at the time of our visit. The report, results, and subsequent recommendations reported herein are also limited to the information available at the time it was prepared and investigated. Conditions may have been in effect prior to the sampling events that have changed over time and which cannot be predicted within the scope of this limited investigation. Any conditions discovered which deviate from the data contained in this report should be presented to us for our evaluation.

This report is intended for the exclusive use of the client. This report and the findings herein shall not, in whole or in part, be relied upon by any other parties, disseminated or conveyed to any other party without prior written consent of the National Guard Bureau, and Compliance Management International, Inc. The findings are relative to the dates of our site visits and should not be relied upon for substantially later dates.

Analysis Method for Flame: Air, Wipes, Paints, and Soil/Solids: EPA 600/R-93/200(M)-7000B; Water: SM-3111B

Analysis Method For Furnace: Air, Wipes, Paints, and Soil/Solids: EPA 600/R-93/200(M)-7010; Water: SM-3113B

mg/Kg = parts per million (ppm) on a dry weight basis mg/L = parts per million (ppm) N/A = Not Applicable %Pb = percent lead on a dry weight basis

ug = micrograms

ug/L = parts per billion (ppb)

Note: All samples were received in good condition unless otherwise noted.

Note: All results have two significant digits. Any additional digits shown should not be considered when interpreting the result.

Air and Wipe results are not corrected for any blank results

Final results for air and wipe samples are based on client supplied information nor verified by this laboratory.

All results are to be considered preliminary and subject to change unless signed by the Technical Director or Deputy.
